

# TLE4267

## 5 V Low Drop Voltage Regulator

### Features

- Output voltage tolerance  $\leq \pm 2\%$
- 400 mA output current capability
- Low-drop voltage
- Very low standby current consumption
- Input voltage up to 40 V
- Overvoltage protection up to 60 V ( $\leq 400$  ms)
- Reset function down to 1 V output voltage
- ESD protection up to 2000 V
- Adjustable reset time
- On/off logic
- Overtemperature protection
- Reverse polarity protection
- Short-circuit proof
- Wide temperature range
- Suitable for use in automotive electronics
- Green Product (RoHS compliant)

### Potential applications

- Automotive applications directly connected to the battery
- Applications with a protected power supply for off-board load

### Product validation

Qualified for automotive applications. Product validation according to AEC-Q100/101.

### Description

TLE4267 is a 5 V low drop voltage regulator for automotive applications in the PG-T0263-7 or PG-DSO-14 package. It supplies an output current of greater than 400 mA. The IC is short-circuit-proof and has an overtemperature protection circuit.

1) Not subject to production test, specified by design.

#### Notes

1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as outside normal operating range. Protection functions are not designed for continuous repetitive operation.

*Note:* This thermal data was generated in accordance with JEDEC JESD51 standards. For more information, go to [www.jedec.org](http://www.jedec.org).

**Functional description**

## 4 Functional description

### Application

The IC regulates an input voltage  $V_I$  in the range of  $5.5\text{ V} < V_I < 40\text{ V}$  to a nominal output voltage of  $V_Q = 5.0\text{ V}$ . A reset signal is generated for an output voltage of  $V_Q < V_{RT}$  (typ. 4.5 V). The reset delay can be set with an external capacitor. The device has two logic inputs. A voltage of  $V_{E2} > 4.0\text{ V}$  applied to the E2-pin (e.g. by ignition) turns the device on. Depending on the voltage on pin E6 the IC may be kept in Hold active-state even if  $V_{E2}$  goes to low level (see [Table 6](#)). This makes it simple to implement a self-holding circuit without external components. When the device is turned off, the output voltage drops to 0 V and current consumption tends towards 0  $\mu\text{A}$ .

### Design notes for external components

The input capacitor  $C_I$  is necessary for compensation of line influences. The resonant circuit consisting of lead inductance and input capacitance can be damped by a resistor of approximately  $1\ \Omega$  in series with  $C_I$ . The output capacitor is necessary for the stability of the regulating circuit. Stability is specified at values of  $C_Q \geq 22\ \mu\text{F}$  and an ESR of  $\leq 3\ \Omega$  within the operating temperature range.

### Circuit description

The control amplifier compares a reference voltage, which is kept highly accurate by resistance adjustment, to a voltage that is proportional to the output voltage and drives the base of the series transistor via a buffer. Saturation control as a function of the load current prevents any over-saturating of the power element.

The reset output RO is in high-state if the voltage on the delay capacitor  $C_D$  is greater or equal  $V_{UD}$ . The delay capacitance  $C_D$  is charged with the current  $I_D$  for output voltages greater than the reset threshold  $V_{RT}$ . If the output voltage drops below  $V_{RT}$  a fast discharge of the delay capacitor  $C_D$  sets in and as soon as  $V_{CD}$  drops below  $V_{LD}$  the reset output RO is set to low-level (see [Figure 6](#)). The reset delay can be set within a wide range by dimensioning the capacitance of the external capacitor.

**Table 6 Truth table for turn-ON/turn-OFF logic**

<b>E2, Inhibit<sup>1)</sup></b>	<b>E6, Hold<sup>2)</sup></b>	<b><math>V_Q</math></b>	<b>Remarks</b>
L	X	OFF	Initial state
H	X	ON	Regulator switched on via Inhibit, by ignition for example
H	L	ON	Hold clamped active to ground by controller while Inhibit is still high
X	L	ON	Previous state remains, even if ignition is shutting off: self-holding state
L	L	ON	Ignition shut off while regulator is in self-holding state
L	H	OFF	Regulator shut down by releasing of Hold while Inhibit remains Low, final state. No active clamping required by external self-holding circuit ( $\mu\text{C}$ ) to keep regulator in off-state

1) Inhibit: E2 Enable function, active high.

2) Hold: E6 Hold and release function, active low.

### Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).
