## TLE94003EP

 $\checkmark$RoHS

## Features

- Three half bridge power outputs
- Very low power consumption in sleep mode

- $3.3 \mathrm{~V} / 5 \mathrm{~V}$ compatible inputs with hysteresis
- All outputs with overload and short circuit protection
- Direct interface for control and diagnosis
- Overtemperature protection
- Over- and Undervoltage lockout
- Cross-current protection

## Potential applications

- HVAC Flap DC motors
- Monostable and bistable relays
- Side mirror $x-y$ adjustment

## Product validation

Qualified for Automotive Applications. Product Validation according to AEC-Q100

## Description

The TLE94003EP is a protected triple half-bridge driver designed especially for automotive motion control applications such as side mirror $x$ - $y$ adjustment. It is part of a larger family offering half-bridge drivers from three outputs to twelve outputs with direct interface or SPI interface.
The half bridge drivers are designed to drive DC motor loads in sequential or parallel operation. Operation modes forward (cw), reverse (ccw), brake and high impedance are controlled from a direct interface. It offers diagnosis features such as short circuit, power supply failure and overtemperature detection. In combination with its low quiescent current, this device is attractive among others for automotive applications. The small fine pitch exposed pad package, PG-TSDSO-14, provides good thermal performance and reduces PCB-board space and costs.

| Type | Package | Marking |
| :--- | :--- | :--- |
| TLE94003EP | PG-TSDSO-14 | TLE94003 |

Table 1 Product Summary

| Operating Voltage | $V_{\mathrm{S}}$ | $5.5 \ldots 20 \mathrm{~V}$ |
| :--- | :--- | :--- |
| Logic Supply Voltage | $V_{\mathrm{DD}}$ | $3.0 \ldots 5.5 \mathrm{~V}$ |
| Maximum Supply Voltage for Load Dump <br> Protection | $V_{\mathrm{S}(\mathrm{LD})}$ | 40 V |
| Minimum Overcurrent Threshold | $I_{\mathrm{SD}}$ | 0.9 A |
| Maximum On-State Path Resistance at $\mathrm{T}_{\mathrm{j}}=150^{\circ} \mathrm{C}$ | $\mathrm{R}_{\mathrm{DSON}(\text { total)_HSx+LSy }}$ | $1.8+1.8 \Omega$ |
| Typical Quiescent Current at $\mathrm{T}_{\mathrm{j}}=85^{\circ} \mathrm{C}$ | $\mathrm{I}_{\mathrm{SQ}}$ | $0.1 \mu \mathrm{~A}$ |

Pin Configuration

## 1 Pin Configuration

### 1.1 Pin Assignment

Figure 1 Pin Configuration TLE94003EP with direct interface

### 1.2 Pin Definitions and Functions

| Pin | Symbol | Function |
| :--- | :--- | :--- |
| 1 | IN1 | Direct input control for power half-bridge 1 |
| 2 | IN2 | Direct input control for power half-bridge 2 |
| 3 | IN3 | Direct input control for power half-bridge 3 |
| 4 | TEST | Test input. This pin can be left open or be terminated to ground |
| 5 | VS | Main supply voltage for power half bridges. |
| 6 | OUT 3 | Power half-bridge 3 |
| 7 | OUT 1 | Power half-bridge 1 |
| 8 | GND | Ground |
| 9 | OUT 2 | Power half-bridge 2 |
| 10 | N.U. | Not used. This pin should either be left open or terminated to ground. |
| 11 | EN1 | Enable input for Half-bridges $1 / 2$ with internal pull-down |
| 12 | EN2 | Enable input for Half-bridge 3 with internal pull-down |
| 13 | EF | Error Flag |
| 14 | VDD | Logic supply voltage |
| EDP | - | Exposed Die Pad; For cooling and EMC purposes only - not usable as electrical <br> ground. Electrical ground must be provided by pins 8. ${ }^{1)}$ |

1) The exposed die pad at the bottom of the package allows better heat dissipation from the device via the PCB. The exposed pad (EP) must be either left open or connected to GND. It is recommended to connect EP to GND for best EMC and thermal performance.

## Pin Configuration

Note: $\quad$ Not used (N.U.) pins and unused outputs are recommended to be left unconnected (open) on the application board. If N.U. pins or unused output pins are routed to an external connector which leaves the PCB, then these outputs should have provision for a zero ohm jumper (depopulated if unused) or ESD protection. In other words, they should be treated like used pins.

### 3.1 Absolute Maximum Ratings

Table 2 Absolute Maximum Ratings ${ }^{1)} \boldsymbol{T}_{\mathrm{j}}=-40^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$

| Parameter | Symbol | Values |  |  | Unit | Note or Test Condition | Number |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Typ. | Max. |  |  |  |
| Voltages |  |  |  |  |  |  |  |
| Supply voltage | $v_{\text {s }}$ | -0.3 | - | 40 | V |  | P_4.1.1 |
| Supply Voltage Slew Rate | $\left\|d v_{s} / d t\right\|$ | - | - | 10 | V/ $/ \mathrm{s}$ | $V_{s}$ increasing and decreasing ${ }^{1 /}$ | P_4.2.2 |
| Power half-bridge output voltage | $V_{\text {OUT }}$ | -0.3 | - | 40 | V | $0 \mathrm{~V}<V_{\text {OUT }}<V_{\text {S }}{ }^{2)}$ | P_4.1.2 |
| Logic supply voltage | $V_{\text {D }}$ | -0.3 | - | 5.5 | V | $0 \mathrm{~V}<V_{S}<40 \mathrm{~V}$ | P_4.1.3 |
| Logic input voltages (EN1, EN2, IN1, IN2, IN3) | $V_{\text {EN }}, V_{\text {INn }}$ | -0.3 | - | VDD | V | $\begin{aligned} & 0 V<V_{S}<40 \mathrm{~V} \\ & 0 \mathrm{~V}<V_{D D}<5.5 \mathrm{~V} \end{aligned}$ | P_4.1.16 |
| Logic output voltage (EF) | $V_{\text {EF }}$ | -0.3 | - | VDD | v | $\begin{aligned} & 0 \mathrm{~V}<V_{\mathrm{S}}<40 \mathrm{~V} \\ & 0 \mathrm{~V}<V_{D D}<5.5 \mathrm{~V} \end{aligned}$ | P_4.1.17 |

| Currents |
| :--- |
| Continuous Supply Current for $V_{S}$ |
| Current per GND pin |
| I |
| Gutp |
| Gut Currents |

## Temperatures

| Junction temperature | $T_{\mathrm{j}}$ | -40 | - | 150 | ${ }^{\circ} \mathrm{C}$ | - | P_4.1.8 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Storage temperature | $T_{\text {stg }}$ | -50 | - | 150 | ${ }^{\circ} \mathrm{C}$ | - | P_4.1.9 |

| ESD susceptibility OUTn and VS pins versus GND. All other pins grounded. | $V_{\text {ESD }}$ | -4 | - | 4 | kV | JEDEC HBM ${ }^{1 / 3)}$ | P_4.1.10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ESD susceptibility all pins | $v_{\text {ESD }}$ | -2 | - | 2 | kV | JEDEC HBM ${ }^{1 / 3)}$ | P_4.1.11 |
| ESD susceptibility all pins | $v_{\text {ESD }}$ | -500 | - | 500 | V | CDM ${ }^{1 / 4)}$ | P_4.1.12 |
| ESD susceptibility corner pins | $v_{\text {ESD }}$ | -750 | - | 750 | V | $\mathrm{CDM}^{144)}$ | P_4.1.13 |

1) Not subject to production test, specified by design
2) Also applicable to not used (N.U.) pins
3) ESD susceptibility, "JEDEC HBM" according to ANSI/ ESDA/ JEDEC JSO01 ( $1.5 \mathrm{k} \Omega$, 100pF)
4) ESD susceptibility, Charged Device Model "CDM" according JEDEC JESD22-C101

## Notes

1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## General Product Characteristics

2. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

## General Product Characteristics

### 3.2 Functional Range

## Table 3 Functional Range

| Parameter | Symbol | Values |  |  | Unit | Note or Test Condition | Number |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Typ. | Max. |  |  |  |
| Supply voltage range for normal operation | $V_{\text {S(nor) }}$ | 5.5 | - | 20 | V | - | P_4.2.1 |
| Logic supply voltage range for normal operation | $V_{\text {DD }}$ | 3.0 | - | 5.5 | V | - | P_4.2.3 |
| Logic input voltages (EN1, EN2, IN1, IN2, IN3) | $V_{\text {IN } n}, V_{\text {ENn }}$ | -0.3 | - | 5.5 | V | - | P_4.2.6 |
| Junction temperature | $T_{\mathrm{j}}$ | -40 | - | 150 | ${ }^{\circ} \mathrm{C}$ |  | P_4.2.5 |

Note: Within the normal functional range the IC operates as described in the circuit description. The electrical characteristics are specified within the conditions given in the related electrical characteristics table.

## General Product Characteristics

### 3.3 Thermal Resistance

Table 4 Thermal Resistance TLE94003EP

| Parameter | Symbol | Values |  |  | Unit | Note or Test Condition | Number |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

1) Not subject to production test, specified by design.
2) Specified $R_{\text {thJA }}$ value is according to JEDEC JESD51-2, -3 at natural convection on FR4 1s0p board; The product (chip + package) was simulated on a $76.2 \times 114.3 \times 1.5 \mathrm{~mm}$ board with minimal footprint copper area and $35 \mu \mathrm{~m}$ thickness. $\mathrm{Ta}=-40^{\circ} \mathrm{C}$, each channel dissipates $0.2 \mathrm{~W} . \mathrm{Ta}=85^{\circ} \mathrm{C}$, each channel dissipates 0.135 W .
3) Specified $R_{\text {thJA }}$ value is according to JEDEC JESD51-2, -3 at natural convection on FR4 1s0p board; The product (chip + package) was simulated on a $76.2 \times 114.3 \times 1.5 \mathrm{~mm}$ board with additional cooling of 300 mm 2 copper area and $35 \mu \mathrm{~m}$ thickness. $\mathrm{Ta}=-40^{\circ} \mathrm{C}$, each channel dissipates 0.2 W . $\mathrm{Ta}=85^{\circ} \mathrm{C}$, each channel dissipates 0.135 W .
4) Specified $R_{\text {thJA }}$ value is according to JEDEC JESD51-2, -3 at natural convection on FR4 1s0p board; The product (chip + package) was simulated on a $76.2 \times 114.3 \times 1.5 \mathrm{~mm}$ board with additional cooling of 600 mm 2 copper area and $35 \mu \mathrm{~m}$ thickness. $\mathrm{Ta}=-40^{\circ} \mathrm{C}$, each channel dissipates $0.2 \mathrm{~W} . \mathrm{Ta}=85^{\circ} \mathrm{C}$, each channel dissipates 0.135 W .
5) Specified $R_{\text {thJA }}$ value is according to JEDEC JESD51-2, -3 at natural convection on FR4 2 s 2 p board; The product (chip + package) was simulated on a $76.2 \times 114.3 \times 1.5 \mathrm{~mm}$ board with two inner copper layers ( $4 \times 35 \mu \mathrm{~m} \mathrm{Cu}$ ). $\mathrm{Ta}=-40^{\circ} \mathrm{C}$, each channel dissipates 0.2 W . $\mathrm{Ta}=85^{\circ} \mathrm{C}$, each channel dissipates 0.135 W .

General Product Characteristics

### 3.4 Electrical Characteristics

Table 5 Electrical Characteristics, $V_{\mathrm{S}}=5.5 \mathrm{~V}$ to $20 \mathrm{~V}, V_{D D}=3.0 \mathrm{~V}$ to $5.5 \mathrm{~V}, T_{\mathrm{j}}=-40^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$, $\mathrm{EN} 1=\mathrm{HIGH}$ and EN2 $=$ HIGH, $I_{\text {OUTn }}=0 \mathrm{~A}$; Typical values refer to $V_{D D}=5.0 \mathrm{~V}, V_{S}=13.5 \mathrm{~V}$ and $T_{J}=25^{\circ} \mathrm{C}$ unless otherwise specified; all voltages with respect to ground, positive current flowing into pin (unless otherwise specified)

| Parameter | Symbol | Values |  |  | Unit | Note or Test Condition | Number |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Typ. | Max. |  |  |  |
| Current Consumption, EN1 = EN2 = GND |  |  |  |  |  |  |  |
| Supply Quiescent current | $I_{\text {SQ }}$ | - | 0.1 | 2 | $\mu \mathrm{A}$ | $-40^{\circ} \mathrm{C} \leq T_{\mathrm{j}} \leq 85^{\circ} \mathrm{C}$ | P_4.4.1 |
| Logic supply quiescent current | $I_{\text {DD_Q }}$ | - | 0.1 | 1 | $\mu \mathrm{A}$ | $-40^{\circ} \mathrm{C} \leq T_{\mathrm{j}} \leq 85^{\circ} \mathrm{C}$ | P_4.4.2 |
| Total quiescent current | $I_{\text {SQ }}+I_{\text {DD_Q }}$ | - | 0.6 | 3 | $\mu \mathrm{A}$ | $-40^{\circ} \mathrm{C} \leq T_{\mathrm{j}} \leq 85^{\circ} \mathrm{C}$ | P_4.4.3 |

## Current Consumption, EN=HIGH

| Supply current | $I_{\text {S_HSON }}$ | - | 1.5 | 3 | mA | All high-sides ON ${ }^{1 / 2)}$ | P_4.4.101 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Logic supply current | $I_{\mathrm{DD}}$ | - | 0.6 | 2.5 | mA |  | P_4.4.5 |

## Over- and Undervoltage Lockout

| Undervoltage Switch ON voltage threshold | $V_{\text {UV ON }}$ | 4.4 | 4.90 | 5.3 | V | $V_{\text {S }}$ increasing | P_4.4.8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Undervoltage Switch OFF voltage threshold | $V_{\text {UV OFF }}$ | 4 | 4.50 | 4.9 | V | $V_{\text {S }}$ decreasing | P_4.4.9 |
| Undervoltage Switch ON/OFF hysteresis | $V_{\text {UV HY }}$ | - | 0.40 | - | V | $V_{\text {UV ON }}-V_{\text {UV OFF }}{ }^{2)}$ | P_4.4.10 |
| Overvoltage Switch OFF voltage threshold | $V_{\text {OV OFF }}$ | 21 | 23 | 25 | V | $V_{\text {S }}$ increasing | P_4.4.11 |
| Overvoltage Switch ON voltage threshold | $V_{\text {OV on }}$ | 20 | 22 | 24 | V | $V_{\text {S }}$ decreasing | P_4.4.12 |
| Overvoltage Switch ON/OFF hysteresis | $V_{\text {OV HY }}$ | - | 1 | - | V | $V_{\text {OV OFF }}-V_{\text {OV ON }}{ }^{2)}$ | P_4.4.13 |
| $\mathrm{V}_{\text {DD }}$ Power-On-Reset | $V_{\text {DD POR }}$ | 2.40 | 2.63 | 2.90 | V | $V_{\text {DD }}$ increasing | P_4.4.14 |
| $\mathrm{V}_{\text {DD }}$ Power-Off-Reset | $V_{\text {DD Poffr }}$ | 2.35 | 2.57 | 2.85 | V | $V_{D D}$ decreasing | P_4.4.15 |
| $\mathrm{V}_{\text {D }}$ Power ON/OFF hysteresis | $V_{\text {DD PORHY }}$ | - | 0.06 | - | V | $V_{\text {DD POR }}-V_{\text {DD POffR }}{ }^{2)}$ | P_4.4.98 |

## Static Drain-source ON-Resistance (High-Side or Low-Side)

| High-Side or Low-Side $R_{\text {DSON }}$ <br> (all outputs) | $R_{\text {DSON_HB_25C }}$ | - | 825 | 1200 | $\mathrm{~m} \Omega$ | $I_{\text {OUT }}= \pm 0.5 \mathrm{~A} ;$ <br> $T_{\mathrm{j}}=25^{\circ} \mathrm{C}$ | P_4.4.16 |

## General Description

## 5 General Description

## $5.1 \quad$ Power Supply

The TLE94003EP has two power supply inputs, $V_{\mathrm{S}}$ and $V_{\mathrm{DD}}$. The half bridge outputs are supplied by $V_{\mathrm{S}}$, which is connected to the 12 V automotive supply rail. $V_{D D}$ is used to supply the $\mathrm{I} / \mathrm{O}$ buffers and internal voltage regulator of the device.
$V_{\mathrm{S}}$ and $V_{\mathrm{DD}}$ supplies are separated so that information stored in the logic block remains intact in the event of voltage drop outs or disturbances on $V_{s}$. The system can therefore continue to operate once $V_{s}$ has recovered, without having to resend commands to the device.
A rising edge on $V_{D D}$ crossing $V_{D D P O R}$ triggers an internal Power-On Reset (POR) to initialize the IC at power-on. All data stored internally is deleted, and the outputs are switched off (high impedance).
An electrolytic and 100 nF ceramic capacitors are recommended to be placed as close as possible to the $V_{\mathrm{s}}$ supply pin of the device for improved EMC performance in the high and low frequency band. The electrolytic capacitor must be dimensioned to prevent the VS voltage from exceeding the absolute maximum rating. In addition, decoupling capacitors are recommended on the $V_{D D}$ supply pin.

### 5.2 Operation modes

### 5.2.1 Normal mode

The TLE94003EP enters normal mode by setting EN1 or EN2 to High. In normal mode, the charge pump is active and all output transistors can be activated or deactivated according to Chapter 6.1.

### 5.2.2 Sleep mode

The TLE94003EP enters sleep mode by setting the EN1 and EN2 pins to Low. The EN1 and EN2 inputs have an internal pull-down resistor.
In sleep mode, all output transistors are turned off and the logic content is reset. The current consumption is reduced to $I_{\text {SQ }}+I_{\text {DD_Q }}$.

### 5.3 Reset Behaviour

The following reset triggers have been implemented in the TLE94003EP:

## $V_{D D}$ Undervoltage Reset:

The digital block will be deactivated, the logic contents cleared and the output stages are switched off if $V_{D D}$ is below the undervoltage threshold, $V_{\text {DD Poffr }}$. The digital block is initialized once $V_{D D}$ voltage levels is above the undervoltage threshold, $V_{\text {DD POR }}$.

## Reset on EN1/2 pins:

If the EN1/2 pins are pulled Low, the logic content is reset and the device enters sleep mode.

### 5.4 Reverse Polarity Protection

The TLE94003EP requires an external reverse polarity protection. During reverse polarity, the free-wheeling diodes across the half bridge output will begin to conduct, causing an undesired current flow ( $l_{\text {RB }}$ ) from ground potential to battery and excessive power dissipation across the diodes. As such, a reverse polarity protection diode is recommended (see Figure 4).

General Description

Figure 4 Reverse Polarity Protection

## Half-Bridge Outputs

## 6 Half-Bridge Outputs

The half-bridge outputs of the TLE94003EP are intended to drive motor loads. They consist of a total of three DMOS half-bridges, which can be driven either continuously or in PWM via INx pins. The output stages integrated circuits protect the outputs against overcurrent and overtemperature.

### 6.1 Output Stages

EN1 and EN2 inputs control the state of the device according to Table 6.

- When EN1 = 0 and EN2 $=0$, the device enters sleep mode with low power consumption and all outputs are OFF (high impedance).
- When EN1=1, HB1 and HB2 are enabled
- When EN2=1, HB3 is enabled

## Table 6 Device states

| EN1 | EN2 | HB1/2 | HB 3 | Device state |
| :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | OFF | OFF | Sleep mode, all outputs are OFF |
| 0 | 1 | OFF | Enabled | Device is in normal mode |
| 1 | 0 | Enabled | OFF | Device is in normal mode |
| 1 | 1 | Enabled | Enabled | Device is in normal mode |

Note: After the transition from sleep mode to normal mode, the outputs are OFF for a duration $t_{\text {SET_DI }}$.See
Figure 5

Figure 5 Output setup time after a transition from standby to normal mode

The control inputs consist of CMOS-compatible schmitt-triggers with hysteresis. There are altogether three control inputs, i.e. IN1, IN2 and IN3 with internal pull-down resistors.
If $\mathrm{EN} 1=0, \mathrm{HB} 1$ and HB 2 are OFF. If $\mathrm{EN} 1=1, \mathrm{HB} 1$ and HB 2 are controlled according toTable 7

Table 7 Functional Truth Table for HB1 and HB2

| EN1 | IN1 | IN2 | HB1 | HB2 | Mode |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | X | X | OFF | OFF | HB1 and HB2 are OFF |
| 1 | 0 | 0 | L | L | Brake Low |

## Half-Bridge Outputs

Table 7 Functional Truth Table for HB1 and HB2

| EN1 | IN1 | IN2 | HB1 | HB2 | Mode |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 0 | 1 | L | H | Motor counter-clockwise |
| 1 | 1 | 0 | H | L | Motor clockwise |
| 1 | 1 | 1 | H | H | Brake High |

If $\mathrm{EN} 2=0, \mathrm{HB} 3$ is high impedance. If $\mathrm{EN} 2=1$, the states of HB 3 is controlled according toTable 8
Table 8 Functional Truth table for HB3

| EN2 | IN3 | HB3 |
| :--- | :--- | :--- |
| 0 | X | OFF |
| 1 | 0 | L |
| 1 | 1 | H |

If two motors are connected in cascaded configuration (see Figure 6), the motors and the half-bridges behave according to Table 9.

Figure 6 TLE94003EP with two motors in cascaded configuration

Table 9 Functional Truth Table for HB1, HB2 and HB3 controlling two cascaded motors

## Half-Bridge Outputs

### 6.2 Diagnosis Monitoring

The EF pin (push-pull output) reports the following error conditions:

- Overcurrent (OC)
- Overtemperature (OT)
- VS overvoltage and VS undervoltage

EF reports an overcurrent event on $\mathrm{HB} 1 / 2$ only if EN1 $=1$. Likewise, EF reports an overcurrent on HB3 only if EN2 $=1$.
After an overcurrent event is detected on $\mathrm{HB} 1 / 2$, EF is latched to 1 , until EN1 $=0$. Likewise, after an overcurrent event detected on $\mathrm{HB} 3, \mathrm{EF}$ is latched to 1 until $\mathrm{EN} 2=0$.

EF reports overtemperature or VS overvoltage/undervoltage events if the device is in normal mode (EN1 = 1 or EN2 $=1$ ). The error flag is latched to 1 for these fault conditions until EN1 $=0$ and EN2 $=0$

Table 10 Error reporting by EF pin

| EN1 | EN2 | Error reported by EF pin |
| :--- | :--- | :--- |
| 0 | 0 | Not applicable, the device is in sleep mode |
| 1 | 0 | OC on HB1/2, OT, VS under/overvoltage |
| 0 | 1 | OC on $\mathrm{HB} 3, \mathrm{OT}$, VS under/overvoltage |
| 1 | 1 | OC on $\mathrm{HB} 1 / 2$, OC on $\mathrm{HB} 3, \mathrm{OT}, \mathrm{VS}$ under/overvoltage |

The table below depicts the EF behaviour:
Table 11 Error flag behaviour and reset conditions

| Fault condition | EF | Reset conditions |
| :--- | :--- | :--- |
| No fault | 0 | - |
| Overcurrent on HB1 or HB2 | 1 (latched) | Set EN1 pin to 0 for tEF_RESET |
| Overcurrent on HB3 | 1 (latched) | Set EN2 pin to 0 for tEF_RESET |
| VS overvoltage | 1 (latched) | $V_{S}<V_{\text {ov oN }}$, EN1 $=0$ and EN2 $=0$ for tEF_RESET |
| VS undervoltage | 1 (latched) | $V_{S}>V_{\text {UV oN }}$, EN1 $=0$ and EN2 $=0$ for tEF_RESET |
| Overtemperature | 1 (latched) | EN1 $=0$ and EN2 $=0$ for tEF_RESET |

### 6.3 Protection

This device has embedded protective functions which are designed to prevent the destruction of the device under fault conditions described in this section. Fault conditions are treated as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

### 6.3.1 Short Circuit of Output to Supply or Ground

The high-side switches are protected against short circuits to ground whereas the low-side switches are protected against short circuits to supply.
The high-side and low-side switches will enter into an over-current condition if the current within the switch exceeds the overcurrent shutdown detection threshold, $I_{\text {SD }}$. Upon detection of the $I_{\text {SD }}$ threshold, an

## Half-Bridge Outputs

overcurrent shutdown filter, $\mathrm{t}_{\text {dSD }}$ is begun. As the current rises beyond the threshold $/_{\mathrm{SD}}$, it will be limited by the current limit threshold, $I_{\text {LIM }}$. Upon expiry of the overcurrent shutdown filter time, the affected power switch is latched off (see Figure 7 and Figure 8) and the EF is set to 1 and latched.
The faulty power switch remains deactivated and EF is latched as long as the corresponding ENx =1.
To resume normal functionality of the power switch (in the event the overcurrent condition disappears or to verify if the failure still exists) the microcontroller shall:

1. clear the error flag by setting the corresponding ENx to 0 (see Table 11)
2. set the corresponding ENx to 1 in order to re-enable the corresponding half-bridges

Figure 7
High-Side Switch - Short Circuit and Overcurrent Protection

Figure 8 Low-Side Switch - Short Circuit and Overcurrent Protection

### 6.3.2 Cross-current protection

In bridge configurations the high-side and low-side power transistors are ensured never to be simultaneously "ON" to avoid cross currents. This is achieved by integrating delays in the driver stage of the power outputs to create a dead-time between switching off of one power transistor and switching on of the adjacent power transistor within the half-bridge. The dead times, $t_{\text {DHL }}$ and $t_{\text {DLH }}$, as shown in Figure 9 case 3 and Figure 10 case 3 , have been specified to ensure that the switching slopes do not overlap with each other. This prevents a cross conduction event.

## Half-Bridge Outputs

Case 3: Delay Time Low Side Driver ON with $\mathrm{t}_{\mathrm{DHL}}$ dead time

Figure 9
Half bridge outputs switching times - high-side to low-side transition

## Half-Bridge Outputs

Figure 10 Half bridge outputs switching times- low-side to high-side transition

### 6.3.3 Temperature monitoring and shutdown

Temperature sensors are integrated in the power stages. The temperature monitoring circuit compares the measured temperature to the shutdown threshold.

## Half-Bridge Outputs

If one or more temperature sensors reach the shut-down temperature threshold, all outputs are latched off. All outputs remain deactivated as long as EN1 $=1$ or EN2 $=1$.
To resume normal functionality of the power switch (in the event the overtemperature condition disappears or to verify if the failure still exists) the microcontroller shall:

1. clear the error flag by setting EN1 and EN2 to 0 (see Table 11)
2. set EN1 or EN2 to 1 in order to send the device from sleep mode back to normal mode

Figure 11 Overtemperature Behaviour

Half-Bridge Outputs

### 6.3.4 VS Undervoltage Behaviour

If the supply voltage decreases to the undervoltage switch-off threshold, $V_{\text {Uv off }}$, then all output switches are switched off, and the error flag EF is set to High (error detection). If $V_{S}$ rises again and reaches the undervoltage switch-on threshold, $V_{\mathrm{Uv} \text { oN }}$, the power-stages are automatically reactivated according to ENx and INx. Refer to Figure 12

Figure 12 Undervoltage behaviour

## Half-Bridge Outputs

### 6.3.5 VS Overvoltage Behaviour

If the supply voltage increases beyond the overvoltage switch threshold, $V_{\text {ov off }}$, then all output switches are switched off and EF is set High, indicating an overvoltage condition. If $V_{S}$ decreases again and reaches the overvoltage switch-on threshold, $V_{\text {ov on }}$, then the power-stages are automatically reactivated according to ENx and INx. Refer to Figure 13.

Figure 13 Overvoltage behaviour

### 6.3.6 $\quad V_{D D}$ Undervoltage

In the event the $\mathrm{V}_{\mathrm{DD}}$ logic supply decreases below the undervoltage threshold, $V_{\text {DD_POFFR }}$, the TLE94003EP will enter reset. $E F$ is set to high impedance during a $\mathrm{V}_{\mathrm{DD}}$ undervoltage event.
The digital block will be initialized and the output stages are switched off to High impedance. The undervoltage reset is released once $V_{D D}$ voltage levels are above the undervoltage threshold, $V_{D D}$ POR .

## Application Information

## 7 Application Information

Note: $\quad$ The following simplified application examples are given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device. The function of the described circuits must be verified in the real application.

### 7.1 Application Diagram

Figure 14 Application example with DC motors

## Application Information

Figure 15 Application Example with two TLE94003EP

## Notes on the application example

1. Series resistors between the microcontroller and the signal pins of the TLE94003EP are recommended if an active reverse polarity protection (MOSFET) is used to protect the VS pin. These resistors limit the current between the microcontroller and the device during negative transients on VBAT (e.g. ISO/TR 7637 pulse 1)

## Application Information

2. Landing pads for ceramic capacitors at the outputs of the TLE94003EP as close as possible to the connectors are recommended (the ceramic capacitors are not populated if unused). These ceramic capacitors can be mounted if a higher performance in term of ESD capability is required.
3. The electrolytic capacitor at the VS pin should be dimensioned in order to prevent the VS voltage from exceeding the absolute maximum rating. PWM operation with a too low capacitance can lead to a VS voltage overshoot, which results in a VS overvoltage detection.
4. Not used ( $N U$ ) pins and unused outputs are recommended to be left unconnected (open) in the application. If $N U$ pins or unused output pins are routed to an external connector which leaves the PCB, then these outputs should have provision for a zero ohm jumper (depopulated if unused) or ESD protection. In other words, NU and unused pins should be treated like used pins.
5. Place bypass ceramic capacitors as close as possible to the VS pins, with shortest connections the GND pins and GND layer, for best EMC performance

## Application Information

### 7.2 Thermal application information

$\mathrm{Ta}=-40^{\circ} \mathrm{C}$, Ch1 to Ch3 are dissipating a total of 0.6 W ( 0.2 W each).
$\mathrm{Ta}=85^{\circ} \mathrm{C}, \mathrm{Ch} 1$ to Ch 3 are dissipating a total of 0.405 W ( 0.135 W each).
