1	0b RW	**BM_RLD (BM_RLD) (bm_rld):** This bit is treated as a scratchpad bit
0	0b RW	**SCI Enable (SCI_EN) (sci_en):** SCI Enable (SCI_EN): Selects the SCI interrupt or the SMI# for various events. When this bit is 1, then the events will generate an SCI interrupt. When this bit is 0, these events will generate an SMI#.

30.7.3 PM1_TMR - Power Management 1 Timer (PM1_TMR)—Offset 8h

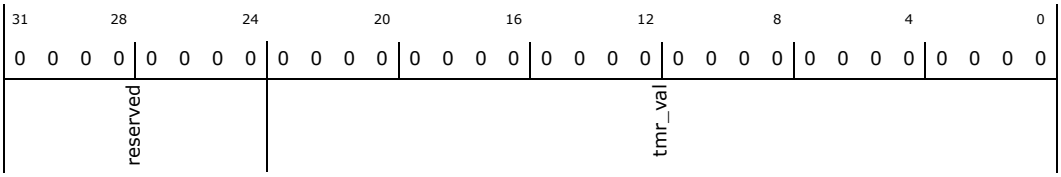
Access Method

Type: I/O Register
(Size: 32 bits)

PM1_TMR: [ACPI_BASE_ADDRESS] + 8h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0b RO	**reserved:** Reserved.
23:0	0b RO	**Timer Value (TMR_VAL) (tmr_val):** This read-only field returns the running count of the PM timer. This counter runs off a 3.579545 MHz clock (derived from 14.31818 MHz divided by 4). It is reset (to 0) during a Platform reset, and then continues counting as long as the system is in the S0 state. Anytime bit 22 of the timer goes HIGH to LOW (bits referenced from 0 to 23), the TMROF_STS bit is set. The High-to-Low transition will occur every 2.3435 seconds. Writes to this register have no effect.

30.7.4 GPE0a_STS - General Purpose Event 0 Status (GPE0a_STS)—Offset 20h

Note: This register is symmetrical to the General Purpose Event 0a Enable Register. Unless indicated otherwise below, if the corresponding _EN bit is set, then when the STS bit get set, the PMC will generate a Wake Event. Once back in an S0 state (or if already in an S0 state when the event occurs), the PMC will also generate an SCI if the SCI_EN bit is set, or an SMI# if the SCI_EN bit is not set. CLARIFICATION: Bits 15:0 should not be reset by CF9 write. Bits 31:16 are reset by CF9h full resets. reset_type=RSMRST_B

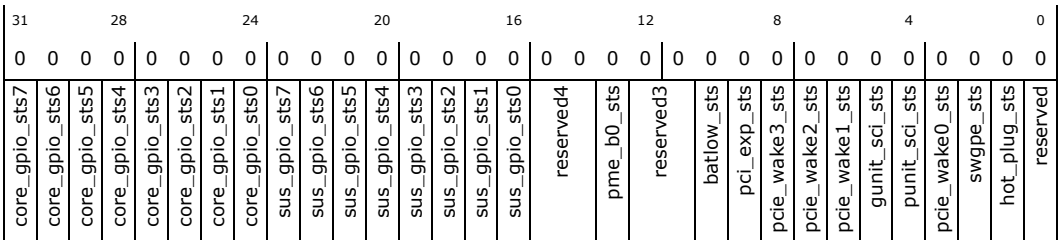
Access Method

Type: I/O Register
(Size: 32 bits)

GPE0a_STS: [ACPI_BASE_ADDRESS] + 20h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RW	**CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts7):** These bits are set any time the corresponding Core GPIO is set up as an input and the corresponding GPIO signal is asserted. Core GPIO pins are: SATA_GP0 (GPIO core 0) SATA_GP1 (GPIO core 1) SATA_LEDN (GPIO core 2) PCIE_CLKREQ0B (GPIO core 3) PCIE_CLKREQ1B (GPIO core 4) PCIE_CLKREQ2B (GPIO core 5) PCIE_CLKREQ3B (GPIO core 6) PCIE_CLKREQ4B (GPIO core 7) If the corresponding enable bit is set in the GPE0a_EN register, then when the CORE_GPIO_STS[n] bit is set, an SCI will be caused, depending on the GPIO_ROUT bits for the corresponding GPIO. These bits are sticky bits and are cleared by writing a 1 back to this bit position. reset_type=Resume Well Reset#
30	0b RW	**CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts6):** These bit is part of CORE GPIO Status (CORE_GPIO_STS)
29	0b RW	**CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts5):** These bit is part of CORE GPIO Status (CORE_GPIO_STS)
28	0b RW	**CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts4):** These bit is part of CORE GPIO Status (CORE_GPIO_STS)
27	0b RW	**CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts3):** These bit is part of CORE GPIO Status (CORE_GPIO_STS)
26	0b RW	**CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts2):** These bit is part of CORE GPIO Status (CORE_GPIO_STS)
25	0b RW	**CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts1):** These bit is part of CORE GPIO Status (CORE_GPIO_STS)
24	0b RW	**CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts0):** These bit is part of CORE GPIO Status (CORE_GPIO_STS)
23	0b RW	**SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts7):** These bits are set any time the corresponding Sus GPIO is set up as an input and the corresponding GPIO signal is asserted. Sus GPIO pins are GPIO_SUS0-7. If the corresponding enable bit is set in the GPE0a_EN register, then when the SUS_GPIO_STS[n] bit is set: * If the system is in an S3-S5 state, the event will also wake the system. * If the system is in an S0 state (or upon waking back to an S0 state), an SCI will be caused, depending on the GPIO_ROUT bits for the corresponding GPI. These bits are sticky bits and are cleared by writing a 1 back to this bit position. reset_type=Resume Well Reset#
22	0b RW	**SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts6):** These bits are part of SUS GPIO Status (SUS_GPIO_STS)
21	0b RW	**SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts5):** These bits are part of SUS GPIO Status (SUS_GPIO_STS)
20	0b RW	**SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts4):** These bits are part of SUS GPIO Status (SUS_GPIO_STS)
19	0b RW	**SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts3):** These bits are part of SUS GPIO Status (SUS_GPIO_STS)
18	0b RW	**SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts2):** These bits are part of SUS GPIO Status (SUS_GPIO_STS)
17	0b RW	**SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts1):** These bits are part of SUS GPIO Status (SUS_GPIO_STS)
16	0b RW	**SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts0):** These bits are part of SUS GPIO Status (SUS_GPIO_STS)
15:14	0b RO	**reserved (reserved4):** Reserved.

Bit Range	Default & Access	Description
13	0b RW	**Power Management Event Bus 0 Status (PME_B0_STS) (pme_b0_sts):** This bit will be set to 1 by the PMC when any internal device with PCI Power Management capabilities on bus 0 asserts the equivalent of the PME# signal. Additionally, if the PME_B0_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the PME_B0_STS bit will generate an SCI (or SMI# if SCI_EN is not set). This bit is cleared by a software write of '1'. Internal devices which can set this bit: - Integrated LAN - HD Audio - SATA - USB
12:11	0b RO	**reserved (reserved3):** Reserved.
10	0b RW	**Battery Low Status (BATLOW_STS) (batlow_sts):** This bit will be set to 1 by hardware when the PMU_BATLOW_B signal goes low. Software clears the bit by writing a 1 to the bit position. In Desktop Mode, this bit will be treated as Reserved.
9	0b RW	**PCI Express Status (PCI_EXP_STS) (pci_exp_sts):** This bit will be set to 1 by hardware to indicate that: - The PME event message was received on one or more of the PCI-Express Ports Note: The PCI PMU_WAKE_B pin and the PCI-Express Beacons have no impact on this bit. Software attempts to clear this bit by writing a 1 to this bit position. If the bit is not cleared and the corresponding PCI_EXP_EN bit is set, the leveltriggered SCI will remain active. Note that a race condition exists where the PCI Express device sends another PME message because the PCI Express device was not serviced within the time when it must resend the message. This may result in a spurious interrupt, and this is comprehended and approved by the PCI Express specification. The window for this race condition is approximately 95-105 milliseconds.
8	0b RW	**PCI Express Wake3 Status (PCIE_WAKE3_STS) (pcie_wake3_sts):** This bit is set by hardware to indicate that the PCI_WAKE3_B pin was asserted. Software writes a 1 to clear this bit. If PCI_WAKE3_B pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive). reset_type=pmc_global_rst_b
7	0b RW	**PCI Express Wake2 Status (PCIE_WAKE2_STS) (pcie_wake2_sts):** This bit is set by hardware to indicate that the PCI_WAKE2_B pin was asserted. Software writes a 1 to clear this bit. If PCI_WAKE2_B pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive). reset_type=pmc_global_rst_b
6	0b RW	**PCI Express Wake1 Status (PCIE_WAKE1_STS) (pcie_wake1_sts):** This bit is set by hardware to indicate that the PCI_WAKE1_B pin was asserted. Software writes a 1 to clear this bit. If PCI_WAKE1_B pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive). reset_type=pmc_global_rst_b
5	0b RW	**GUNIT SCI status (GUNIT_SCI_STS) (gunit_sci_sts):** This bit will be set if the Graphics Unit requests SCI
4	0b RW	**PUNIT SCI status (PUNIT_SCI_STS) (punit_sci_sts):** This bit will be set if the Power Management Unit requests SCI
3	0b RW	**PCI Express Wake0 Status (PCIE_WAKE0_STS) (pcie_wake0_sts):** This bit is set by hardware to indicate that the PMU_WAKE_B pin was asserted. Software writes a 1 to clear this bit. If PMU_WAKE_B pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive). reset_type=pmc_global_rst_b
2	0b RW	**Software GPE Status (SWGPE_STS) (swgpe_sts):** The SWGPE_CTRL bit (bit 1 of GPE_CTRL reg) acts as a level input to this bit.
1	0b RO	**Hot Plug Status (HOT_PLUG_STS) (hot_plug_sts):** This bit is set to 1 by hardware when a PCI-Express hotplug event occurs. This will cause an SCI if the HOT_PLUG_EN and SCI_EN bits are set. This bit is cleared by writing a 1 to this bit position. The following events cause this bit to set - Assert_GPE message received from any of the PCI_E ports in the SOC - Assert_HPGPE message received from any of the PCI_E ports in the SOC
0	0b RO	**reserved:** Reserved.

30.7.5 GPE0a_EN - General Purpose Event 0 Enables (GPE0a_EN)—Offset 28h

Note: This register is symmetrical to the General Purpose Event 0a Status Register. reset_type=Resume Well Reset#

Access Method

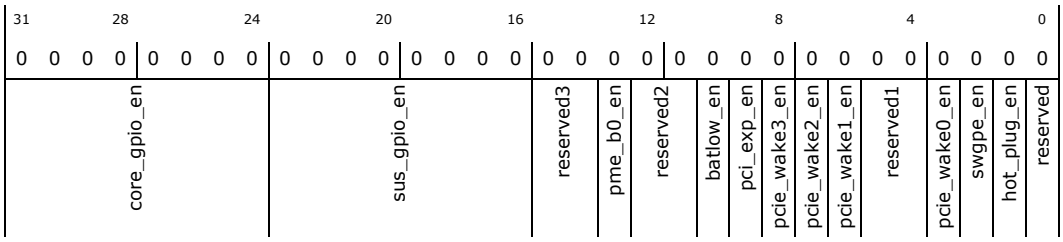
Type: I/O Register (Size: 32 bits)

GPE0a_EN: [ACPI_BASE_ADDRESS] + 28h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0b RW	**CORE GPIO Enable (CORE_GPIO_EN) (core_gpio_en):** These bits enable the corresponding CORE_GPIO_STS[n] bits being set to cause an SCI and/or wake event.
23:16	0b RW	**SUS GPIO Enable (SUS_GPIO_EN) (sus_gpio_en):** These bits enable the corresponding SUS_GPIO_STS[n] bits being set to cause an SCI and/or wake event.
15:14	0b RO	**reserved (reserved3):** Reserved.
13	0b RW	**PME_B0 Enable (PME_B0_EN) (pme_b0_en):** Enables the setting of the PME_B0_STS bit to generate a wake event and/or an SCI or SMI#. In addition to being reset by SRTCRST_B assertion, the PMC also clears this bit due to certain events: - Power button override - CPU thermal trip reset_type=SRTCRST_B
12:11	0b RO	**reserved (reserved2):** Reserved.
10	0b RW	**Low Battery Enable (BATLOW_EN) (batlow_en):** This bit enables the PMU_BATLOW_B signal to cause an SMI# or SCI (depending on the SCI_EN bit) when it goes low.This bit does not prevent the PMU_BATLOW_B signal from inhibiting the wake event. In Desktop Mode this bit will be treated as Reserved. In addition to being reset by SRTCRST_B assertion, the PMC also clears this bit due to certain events: - Power button override - CPU thermal trip reset_type=SRTCRST_B
9	0b RW	**PCI Express Enable (PCI_EXP_EN) (pci_exp_en):** Enables the PMC to cause an SCI when PCI_EXP_STS bit is set. This is used to allow the PCI Express ports, to cause an SCI due to wake/PME events
8	0b RW	**PCI Express Wake3 Enable (PCIE_WAKE3_EN) (pcie_wake3_en):** This bit, when set to 1, enables the PCIE_WAKE3_STS to to cause an SCI
7	0b RW	**PCI Express Wake2 Enable (PCIE_WAKE2_EN) (pcie_wake2_en):** This bit, when set to 1, enables the PCIE_WAKE2_STS to to cause an SCI
6	0b RW	**PCI Express Wake1 Enable (PCIE_WAKE1_EN) (pcie_wake1_en):** This bit, when set to 1, enables the PCIE_WAKE1_STS to to cause an SCI
5:4	0b RO	**reserved (reserved1):** Reserved.

Bit Range	Default & Access	Description
3	0b RW	**PCI Express Wake0 Enable (PCIE_WAKE0_EN) (pcie_wake0_en):** This bit, when set to 1, enables the PCIE_WAKE0_STS to to cause an SCI
2	0b RW	**Software GPE Enable (SWGPE_EN) (swgpe_en):** This bit, when set to 1, enables the SW GPE function. If SWGPE_CTRL is written to a 1, hardware will set SWGPE_STS (acts as a level input) If SWGPE_STS, SWGPE_EN, and SCI_EN are all 1's, an SCI will be generated If SWGPE_STS = 1, SWGPE_EN = 1, SCI_EN = 0, and GBL_SMI_EN = 1 then an SMI# will be generated
1	0b RW	**Hot Plug Enable (HOT_PLUG_EN) (hot_plug_en):** Enables the PMC to cause an SCI when the HOT_PLUG_STS bit is set. This is used to allow the PCI Express ports to cause an SCI due to hot-plug events.
0	0b RO	**reserved:** Reserved.

30.7.6 SMI_EN - SMI Control and Enable (SMI_EN)—Offset 30h

Access Method

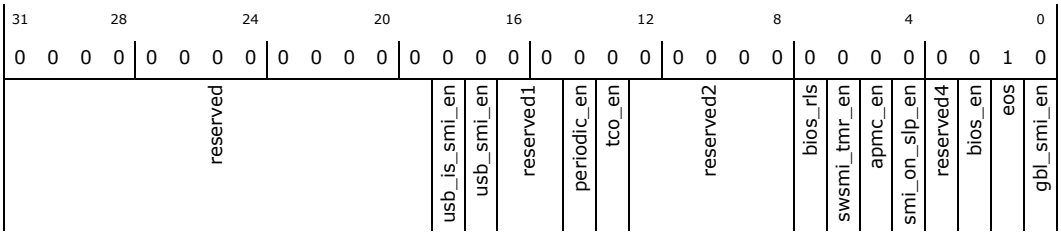
Type: I/O Register (Size: 32 bits)

SMI_EN: [ACPI_BASE_ADDRESS] + 30h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000002h



Bit Range	Default & Access	Description
31:19	0b RO	**reserved:** Reserved.
18	0b RW	**Intel USB 2 Enable (USB_IS_SMI_EN): (usb_is_smi_en):** Enables Intel-Specific USB2 SMI logic to cause SMI#.
17	0b RW	**USB SMI Enable (USB_SMI_EN): (usb_smi_en):** Enables SMI from USB
16:15	0b RO	**reserved1:** Reserved.
14	0b RW	**Periodic Enable (PERIODIC_EN) (periodic_en):** Setting this bit will cause the PMC to generate an SMI# when the PERIODIC_STS bit is set in the SMI_STS register.
13	0b RW	**TCO Enable (TCO_EN): (tco_en):** when set Enables the TCO logic to generate SMI#. when cleared disables TCO logic generating an SMI#. NOTE: This bit can not be written once the TCO_LOCK bit is set. This prevents unauthorized software from disabling the generation of TCO-based SMI's
12:8	0b RO	**reserved2:** Reserved.

Bit Range	Default & Access	Description
7	0b RW	**BIOS_RLS (BIOS_RLS): (bios_rls):** Enables the generation of an SCI interrupt for ACPI software when a one is written to this bit position by BIOS software. This bit always reads a zero. NOTE: GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place.
6	0b RW	**Software SMI Timer Enable (SWSMI_TMR_EN): (swsmi_tmr_en):** Software sets this bit to a 1 to start the Software SMI# Timer. When the timer expires (depending on the SWSMI_RATE_SEL bits), it will generate an SMI# and set the SWSMI_TMR_STS bit. The SWSMI_TMR_EN bit will remain at 1 until software sets it back to 0. Clearing the SWSMI_TMR_EN bit before the timer expires will reset the timer and the SMI# will not be generated. The default for this bit is 0.
5	0b RW	**APMC_EN (apmc_en):** APMC Enable - If set, this enables writes to the APM register to cause an SMI#
4	0b RW	**SMI On Sleep Enable (SMI_ON_SLP_EN): (smi_on_slp_en):** If this bit is set, the PMC will generate an SMI# when a write access attempts to set the SLP_EN bit (in the PM1_CNT register). Furthermore, the PMC will not put the system to a sleep state. This allows the SMI# handler work around chip-level bugs. It is expected that the SMI# handler will turn off the SMI_ON_SLP_EN bit before actually setting the SLP_EN bit.
3	0b RO	**reserved4:** Reserved.
2	0b RW	**BIOS Enable (BIOS_EN): (bios_en):** Enables the generation of SMI# when ACPI software writes a 1 to the GBL_RLS bit. Note that if the BIOS_STS bit, which gets set when software writes a 1 to GBL_RLS bit, is already a 1 at the time that BIOS_EN becomes 1, an SMI# will be generated when BIOS_EN gets set.
1	1b RW	**End of SMI (EOS): (eos):** SMI handler sets this bit when it finishes handling the SMI. Setting this bit will force the PMC internal SMI request to zero for 1 clock.Thus if the internal SMI request is still asserted due to new SMI trigger a new rising edge will happen, setting the interrupt to the PMC controller.
0	0b RW	**Global SMI Enable (GBL_SMI_EN): (gbl_smi_en):** When set, this bit enables the generation of SMIs in the system upon any enabled SMI event. This bit is reset by a PMU_PLTRST_B reset event. If this bit is not set, no SMI# will be generated. NOTE: When the SMI_LOCK bit is set, this bit cannot be changed.

30.7.7 SMI_STS - SMI Status Register (SMI_STS)—Offset 34h

Access Method

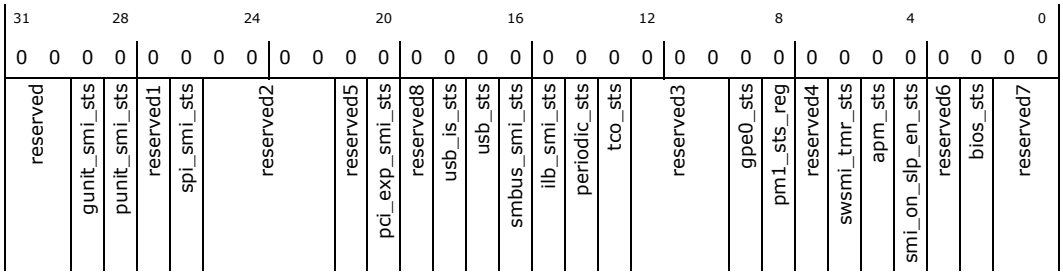
Type: I/O Register (Size: 32 bits)

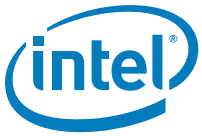
SMI_STS: [ACPI_BASE_ADDRESS] + 34h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h





Bit Range	Default & Access	Description
31:30	0b RO	**reserved:** Reserved.
29	0b RW	**GUNIT SMI Status (GUNIT_SMI_STS): (gunit_smi_sts):** This bit will be set if Graphics unit is requesting an SMI#. Writing a '1' to this bit position clears this bit to '0'
28	0b RW	**PUNIT SMI Status (PUNIT_SMI_STS): (punit_smi_sts):** This bit will be set if Power Management is requesting an SMI#. Writing a '1' to this bit position clears this bit to '0'
27	0b RO	**reserved (reserved1):** Reserved.
26	0b RO	**SPI_SMI Status (SPI_SMI_STS): (spi_smi_sts):** This bit will be set when the SPI logic is requesting an SMI#
25:22	0b RO	**reserved (reserved2):** Reserved.
21	0b RW	**reserved (reserved5):** This bit is reserved for future use
20	0b RO	**PCI_EXP_SMI Status (PCI_EXP_SMI_STS): (pci_exp_smi_sts):** 1- PCI Express SMI event occurred. This could be due to a PCI Express PME event.
19	0b RO	**reserved (reserved8):** Reserved.
18	0b RO	**Intel USB2 Status (USB_IS_STS): (usb_is_sts):** This non-sticky read-only bit is a logical OR of each of the SMI status bits in the Intel-Specific USB2 SMI Status Register ANDed with the corresponding enable bits. Additionally, the Port Disable Write Enable SMI is reported in this bit; the specific status bit for this event is contained in the USB Per-Port Registers Write Control Register in this I/O space. This bit will not be active if the enable bits are not set. Writes to this bit will have no effect. All integrated USB2 Host Controllers are represented with this bit.
17	0b RO	**USB Status (USB_STS): (usb_sts):** This bit will be set when the USB logic is requesting an SMI#
16	0b RO	**SMBUS_SMI Status (SMBUS_SMI_STS): (smbus_smi_sts):** This bit will be set when the SMBUS logic is requesting an SMI#
15	0b RO	**ILB_SMI Status (ILB_SMI_STS): (ilb_smi_sts):** This bit will be set when the ILB logic is requesting an SMI#
14	0b RW	**Periodic Status (PERIODIC_STS): (periodic_sts):** This bit will be set at the rate determined by the PER_SMI_SEL bits. If the PERIODIC_EN bit is also set, the PMC will generate an SMI#. This bit is cleared by writing a 1 to this bit position.
13	0b RW	**TCO Status (TCO_STS): (tco_sts):** Indicates SMI was caused by the TCO logic. This bit is cleared by writing a 1 to this bit position.
12:10	0b RO	**reserved (reserved3):** Reserved.
9	0b RO	**GPE0a Status (GPE0a_STS): (gpe0_sts):** There are several status/enable bit pairs in GPE0a_STS/EN that are capable of triggering SMI. This bit is a logical OR of all of those pairs (i.e. this bit is asserted whenever at least one of those pairs has both the status and enable bit asserted). This bit is NOT sticky. Writes to this bit will have no effect. Note: The setting of this bit does not cause the SMI#.
8	0b RO	**PM1 Status Register (PM1_STS_REG): (pm1_sts_reg):** This is an OR of the bits (except for bits 5 and 4) in the ACPI PM1_STS_EN Status Reg. Not sticky. Writes to this bit have no effect. Note: The setting of this bit does not cause the SMI#.
7	0b RO	**reserved (reserved4):** Reserved.

Bit Range	Default & Access	Description
6	0b RW	**Software SMI Timer Status (SWSMI_TMR_STS): (swsmi_tmr_sts):** This bit will be set to 1 by the hardware when the Software SMI# Timer expires. This bit will remain 1 until the software writes a 1 to this bit.
5	0b RW	**APM_STS (apm_sts):** APM Status - SMI# was generated by a write access to the APM control register and if the APMC_EN bit is set. This bit is cleared by writing a one to its bit position.
4	0b RW	**SMI_ON_SLP_EN Status (SMI_ON_SLP_EN_STS): (smi_on_slp_en_sts):** This bit will be set by the PMC when a write access attempts to set the SLP_EN bit. This bit is cleared by writing a 1 to this bit position
3	0b RO	**reserved (reserved6):** Reserved.
2	0b RW	**BIOS Status (BIOS_STS): (bios_sts):** This bit gets set by hardware when a 1 is written by software to the GBL_RLS bit. When both BIOS_EN and the BIOS_STS bit are set, an SMI# will be generated. The BIOS_STS bit is cleared when software writes a 1 to this bit position.
1:0	0b RO	**reserved (reserved7):** Reserved.

30.7.8 ALT_GPIO_SMI - Alternate GPIO SMI Status and Enable Register. (ALT_GPIO_SMI)—Offset 38h

reset_type=Resume Well Reset#

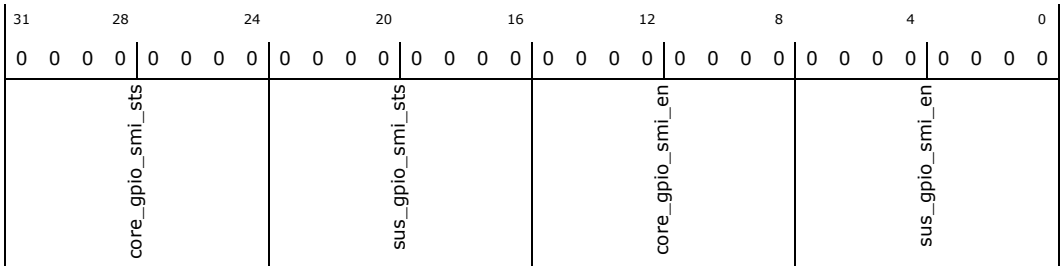
Access Method

Type: I/O Register (Size: 32 bits)

ALT_GPIO_SMI: [ACPI_BASE_ADDRESS] + 38h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0b RW	**CORE GPIO SMI Status Setting (CORE_GPIO_SMI_STS): (core_gpio_smi_sts):** These bits report the status of the corresponding GPIO's. 1 = active, -0 = inactive. These bits are sticky. If the following conditions are true, then an SMI# will be generated: 1. The corresponding enable bit in this register is set 2. The corresponding GPIO must be routed in the GPIO_ROUT register to cause an SMI. 3. The corresponding GPIO must be implemented. Core GPIO pins are: SATA_GP0 (GPIO core 0) SATA_GP1 (GPIO core 1) SATA_LEDN (GPIO core 2) PCIE_CLKREQ0B (GPIO core 3) PCIE_CLKREQ1B (GPIO core 4) PCIE_CLKREQ2B (GPIO core 5) PCIE_CLKREQ3B (GPIO core 6) PCIE_CLKREQ4B (GPIO core 7) All bits are in the resume well. Default for these bits are dependent on the state of the GPIO pins.

Bit Range	Default & Access	Description
23:16	0b RW	**SUS GPIO SMI Status Setting (SUS_GPIO_SMI_STS): (sus_gpio_smi_sts):** These bits report the status of the corresponding GPIO's. 1 = active, -0 = inactive. These bits are sticky. If the following conditions are true, then an SMI# will be generated: 1. The corresponding enable bit in this register is set 2. The corresponding GPIO must be routed in the GPIO_ROUT register to cause an SMI. 3. The corresponding GPIO must be implemented. Sus GPIO pins are GPIO_SUS0-7. All bits are in the resume well. Default for these bits are dependent on the state of the GPIO pins.
15:8	0b RW	**CORE GPIO SMI Enable Setting (CORE_GPIO_SMI_EN): (core_gpio_smi_en):** These bits are used to enable the corresponding GPIO to cause an SMI#.
7:0	0b RW	**SUS GPIO SMI Enable Setting (SUS_GPIO_SMI_EN): (sus_gpio_smi_en):** These bits are used to enable the corresponding GPIO to cause an SMI#.

30.7.9 UPRWC - USB Per-Port Registers Write Control (UPRWC)—Offset 3Ch

Access Method

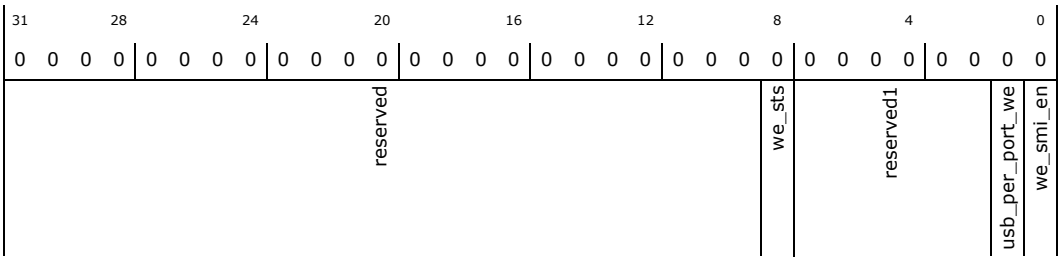
Type: I/O Register (Size: 32 bits)

UPRWC: [ACPI_BASE_ADDRESS] + 3Ch

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h



Bit Range	Default & Access	Description
31:9	0b RO	**reserved:** Reserved.
8	0b RW	**Write Enable Status (WE_STS) (we_sts):** This bit gets set by hardware when the Per-Port Registers Write Enable bit is written from 0 to 1. This bit is cleared by software writing a 1b to this bit location. The setting condition takes precedence over the clearing condition in the event that both occur at once. When this bit is 1b and bit 0 is 1b, the INTEL_USB2_STS bit is set in the SMI_STS register.
7:2	0b RO	**reserved (reserved1):** Reserved.
1	0b RW	**USB Per-Port Registers Write Enable (USB_PER_PORT_WE) (usb_per_port_we):** This bit controls whether writes are enabled to the USB Port Power Off and Port Disable Override registers
0	0b RW	**Write Enable SMI Enable (WE_SMI_EN) (we_smi_en):** This bit enables the generation of SMI when the Per-Port Registers Write Enable (bit 1) is written from 0 to 1. Once written to 1b, this bit can not be cleared by software.

30.7.10 GPE_CTRL - General Purpose Event Control (GPE_CTRL)—Offset 40h

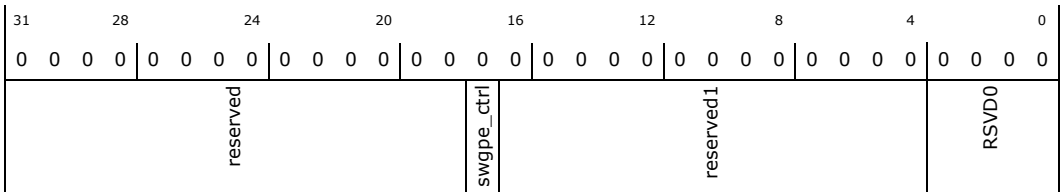
Access Method

Type: I/O Register
(Size: 32 bits)

GPE_CTRL: [ACPI_BASE_ADDRESS] + 40h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h



Bit Range	Default & Access	Description
31:18	0b RO	**reserved:** Reserved.
17	0b RW	**Software GPE Control (SWGPE_CTRL) (swgpe_ctrl):** This bit allows software to control the assertion of SWGPE_STS bit. This bit is used by hardware as the level input signal for the SWGPE_STS bit in the GPE0a_STS register. When SWGPE_CTRL is 1, SWGPE_STS will be set to 1, and writes to SWGPE_STS with a value of 1 to clear SWGPE_STS will result in SWGPE_STS being set back to 1 by hardware. When SWGPE_CTRL is 0, writes to SWGPE_STS with a value of 1 will clear SWGPE_STS to 0. In addition to being reset by RSMRST_B assertion, the PMC also clears this bit due to certain events: - Power button override - CPU thermal trip

3:0	0b RO	**RSVD0:** Reserved

30.7.11 PM2A_CNT_BLK - PM2a Control Block (PM2A_CNT_BLK)—Offset 50h

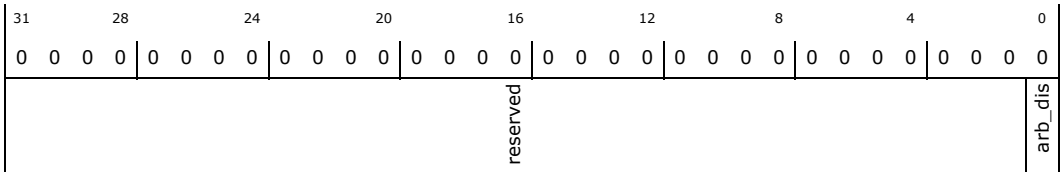
Access Method

Type: I/O Register
(Size: 32 bits)

PM2A_CNT_BLK: [ACPI_BASE_ADDRESS] + 50h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0b RO	**reserved:** Reserved.
0	0b RW	**ARB_DIS (ARB_DIS) (arb_dis):** This bit is essentially just a scratchpad bit for legacy software compatibility.

30.7.12 TCO_RLD: TCO Reload Register (TCO_RLD)—Offset 60h

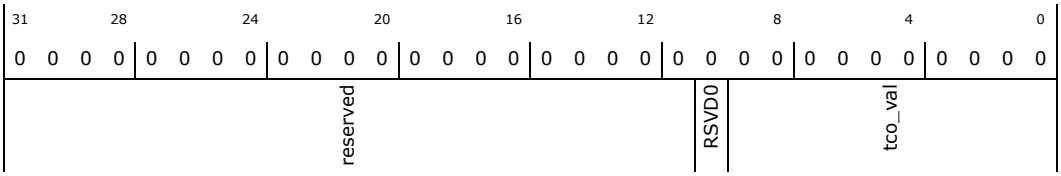
Access Method

Type: I/O Register
(Size: 32 bits)

TCO_RLD: [ACPI_BASE_ADDRESS] + 60h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h



Bit Range	Default & Access	Description
31:11	0b RO	**reserved:** Reserved.
10	0b RO	**RSVD0:** Reserved
9:0	0b RO	**TCO Timer Value (TCO_TVAL) (tco_val):** Reading this register will return the current count of the TCO timer. Writing any value to this register will reload the timer to prevent the timeout.

30.7.13 TCO_STS: TCO Timer Status (TCO_STS)—Offset 64h

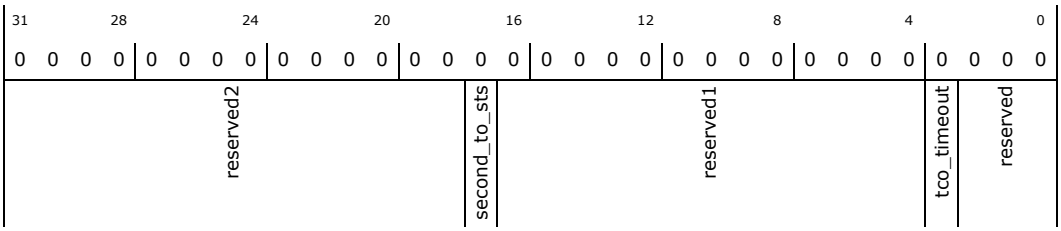
Access Method

Type: I/O Register
(Size: 32 bits)

TCO_STS: [ACPI_BASE_ADDRESS] + 64h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h



Bit Range	Default & Access	Description
31:18	0b RO	**reserved (reserved2):** Reserved.
17	0b RW	**Second Timeout Status(SECOND_TO_STS) (second_to_sts):** PMC sets this bit to 1 to indicate that the TIMEOUT bit had been (or is currently) set and a second timeout occurred before the TCO_RLD register was written. If this bit is set and the NO_REBOOT config bit is 0, then the PMC will reboot the system after the second timeout. The reboot is done by asserting PMU_PLTRST_B. This bit is only cleared by writing a 1 to this bit or by a RSMRST_B.
16:4	0b RO	**reserved (reserved1):** Reserved.
3	0b RW	**TCO Timeout (TCO_TIMEOUT) (tco_timeout):** Bit set to 1 by PMC to indicate that the SMI was caused by TCO timer reaching 0.
2:0	0b RO	**reserved:** Reserved.

30.7.14 TCO1_CNT: TCO Timer Control (TCO1_CNT)—Offset 68h

Access Method

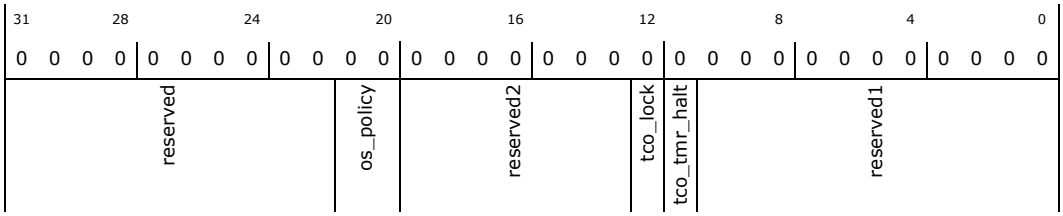
Type: I/O Register (Size: 32 bits)

TCO1_CNT: [ACPI_BASE_ADDRESS] + 68h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h



Bit Range	Default & Access	Description
31:22	0b RO	**reserved:** Reserved.
21:20	0b RW	**OS_POLICY (os_policy):** OS-based software writes to these bits to select the policy that the BIOS will use after the platform resets due the WDT. The following convention is recommended for the BIOS and OS: 00 Boot normally 01 Shut down 10 Dont load OS. Hold in pre-boot state and use LAN to determine next step 11 Reserved
19:13	0b RO	**reserved (reserved2):** Reserved.
12	0b RW	**TCO Lock (TCO_LOCK) (tco_lock):** When set to 1, this bit prevents writes from changing the TCO_EN bit (in offset 30h of Power Management I/O space). Once this bit is set to 1, it can not be cleared by software writing a 0 to this bit location. A core-well reset is required to change this bit from 1 to 0. This bit defaults to 0.
11	0b RW	**TCO Timer Halt (TCO_TMR_HALT) (tco_tmr_halt):** 1 = The TCO timer will halt. It will not count, and thus cannot reach a value that would cause an SMI# or to cause the SECOND_TO_STS bit to be set. This will also prevent rebooting. 0 = The TCO timer is enabled to count. This is the default.

Bit Range	Default & Access	Description
10:0	0b RO	**reserved1:** Reserved.

30.7.15 TCO_TMR: TCO Timer Register (TCO_TMR)—Offset 70h

Access Method

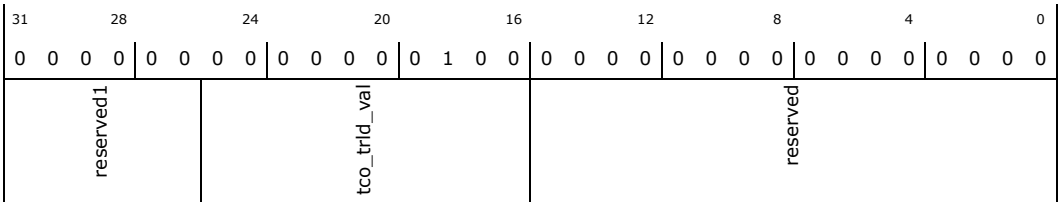
Type: I/O Register (Size: 32 bits)

TCO_TMR: [ACPI_BASE_ADDRESS] + 70h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00040000h



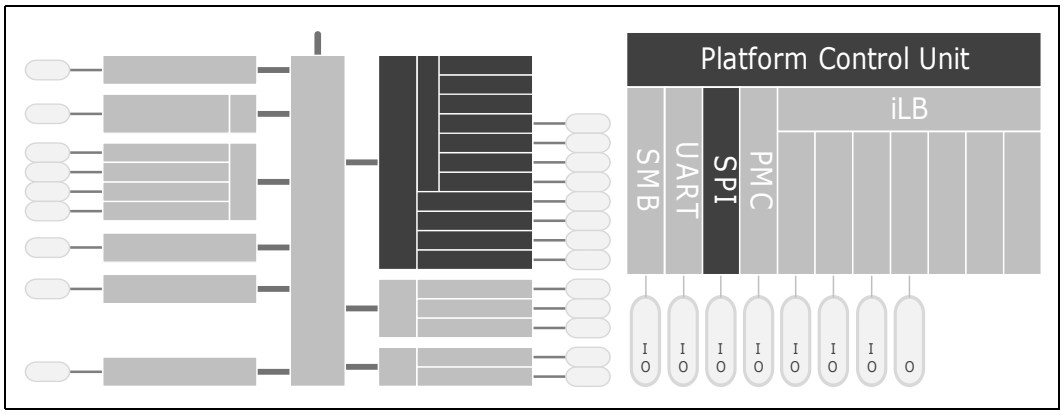
Bit Range	Default & Access	Description
31:26	0b RO	**reserved (reserved1):** Reserved.
25:16	004h RW	**TCO Timer reload value (TCO_TRLD_VAL) (tco_trld_val):** Value that is loaded into the timer each time the TCO_RLD register is written. Values of 0000h or 0001h will be ignored and should not be attempted. The timer is clocked at approximately 1 second, and thus allows timeouts ranging from 2 seconds to 1023 seconds. **Note:** The timer has an error of +/- 1 tick (1.0s). The TCO Timer will only count down in the S0 state.
15:0	0b RO	**reserved:** Reserved.

31 PCU – Serial Peripheral Interface (SPI)

The SoC implements a SPI controller as the interface for BIOS Flash storage. This SPI Flash device is also required to support firmware for the Trusted Execution Engine (required). The controller supports a maximum of two SPI Flash devices, using two chip select signals, with speeds of 20 MHz, 33 MHz or 50 MHz.

Note: The default interface speed is 20 MHz.

Note: SPI must operate in descriptor mode for correct operation of the SoC.



31.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

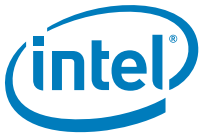


Table 298. SPI Signals

Signal Name	Direction Plat. Power	Description
PCU_SPI_CLK	O V1P8A	**SPI Clock:** When the bus is idle, the owner will drive the clock signal low.
PCU_SPI_CS[0]#	O V1P8A	**SPI Chip Select 0:** Used as the SPI bus request signal for the first SPI Flash device.
PCU_SPI_CS[1]#	O V1P8A	**SPI Chip Select 1:** Used as the SPI bus request signal for the second SPI Flash devices. *This signal is muxed and may be used by other functions.*
PCU_SPI_MISO	I V1P8A	**SPI Master IN Slave OUT:** Data input pin for the SoC.
PCU_SPI_MOSI	I/O V1P8A	**SPI Master OUT Slave IN:** Data output pin for the SoC. Operates as a second data input pin for the SoC when in Single Input, Dual Output Fast Read mode.

Note: All SPI signals are tri-stated with 20k ohm internal weak pull-up until PMC_CORE_PWROK is asserted.

31.2 Features

The SPI controller supports up to two SPI Flash devices using two separate chip select pins. Each SPI Flash device can be up to 16 MB. The SoC SPI interface supports 20 MHz, 33 MHz and 50 MHz SPI Flash devices. No other types of SPI devices are supported.

Communication on the SPI bus is done with a Master – Slave protocol. The Slave is connected to the SoC and is implemented as a tri-state bus.

Note: When GCS.BBS = 00b, LPC is selected as the location for BIOS. The SPI Flash may still contain data and firmware for other SoC functionality.

Note: When GCS.BBS =11b and a SPI device is detected by the SoC, LPC based BIOS Flash is disabled.

31.2.1 Operation Mode Feature Overview

The SPI controller has two operational modes, Non-Descriptor and Descriptor.

31.2.1.1 Non-Descriptor Mode

If no valid signature is read (either because there is no SPI Flash, or there is an SPI Flash with no valid descriptor), the Flash Controller will operate in a Non-Descriptor mode.

The following features are not supported in Non-Descriptor mode:

- Trusted Execution Engine
- Secure Boot
- Soft Straps
- Two SPI Flash device support
- Hardware sequencing access
- Descriptor-based security access restrictions

Note: When operating in Non-Descriptor mode, software sequencing must be used to access the Flash.

Note: When operating in Non-Descriptor Mode, and a SPI Flash is attached to the SoC, it is required that the Flash Valid Signature, at offset 10h of the Flash Descriptor, does not equal the expected valid value (0FF0A55Ah) or the SPI Controller will wrongly interpret that it has a valid signature and that a Flash Descriptor has been implemented.

31.2.2 Descriptor Mode

Descriptor Mode is required to enable many features of the SoC:

- Trusted Execution Engine
- Secure Boot
- PCI Express* root port configuration
- Supports for two SPI components using two separate chip select pins
- Hardware enforced security restricting master accesses to different regions
- Soft Strap region providing the ability to use Flash NVM to remove the need for pull-up/pull-down resistors for strapping SoC features
- Support for the SPI Fast Read instruction and frequencies greater than 20 MHz
- Support for Single Input, Dual Output Fast reads
- Use of standardized Flash instruction set

SPI Flash Regions

In Descriptor Mode the Flash is divided into five separate regions:

Table 299. SPI Flash Regions

Region	Content
0	Flash Descriptor
1	BIOS
2	Trusted Execution Engine
3	Reserved
4	Platform Data

Only two masters can access the 3 regions: The SoC CPU core running BIOS code and the Trusted Execution Engine. The only required region is Region 0, the Flash Descriptor. Region 0 must be located in the first sector of Device 0.

Flash Regions Sizes

SPI Flash space requirements differ by platform and configuration. Table 300 indicates the space needed in the Flash for each region.

Table 300. Region Size Versus Erase Granularity of Flash Components

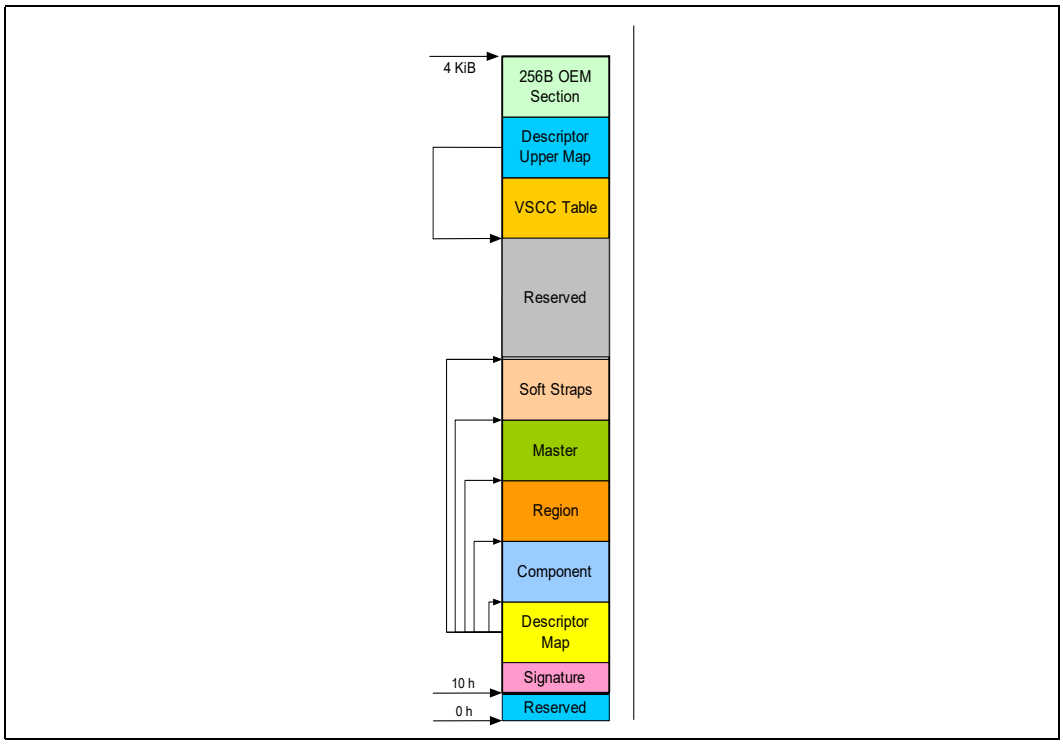
Region	Size with 4 KB Blocks	Size with 8 KB Blocks	Size with 64 KB Blocks
Descriptor	4 KB	8 KB	64 KB
BIOS	Varies by Platform	Varies by Platform	Varies by Platform
Trusted Execution Engine	Varies by Platform	Varies by Platform	Varies by Platform

31.2.3 Flash Descriptor

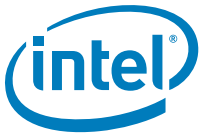
The maximum size of the Flash Descriptor is 4 KB. If the block/sector size of the SPI Flash device is greater than 4 KB, the Flash descriptor will only use the first 4 KB of the first block. The Flash descriptor requires its own block at the bottom of memory (00h). The information stored in the Flash Descriptor can only be written during the manufacturing process as its read/write permissions must be set to Read only when the system containing the SoC leaves the manufacturing floor.

The Flash Descriptor is made up of eleven sections as indicated in below figure.

Figure 131.Flash Descriptor Sections



- The **Reserved** section at offset 0h is related to functionality not supported by the SoC.
- The **Signature** section selects Descriptor Mode as well as verifies if the Flash is programmed and functioning. The data at the bottom of the Flash (offset 10h) must be 0FF0A55Ah in order to be in Descriptor mode.
- The **Descriptor Map** section defines the logical structure of the Flash in addition to the number of components used.
- The **Component** section has information about the SPI Flash in the system including:
  - Density of each component
  - Illegal instructions (such as chip erase)
  - Frequencies for read, fast read and write/erase instructions.
- The **Region** section points to the four other regions as well as the size of each region.
- The **Master** region contains the security settings for the Flash, granting read/write permissions for each region and identifying each master by a requestor ID.
- The **Soft Straps** section contains parameter bits that can be used to configure SoC features and/or behaviors.



- The **Reserved** section between the top of the **Soft Straps** section and the bottom of the **VSCC Table** is reserved for future SoC usages.
- The **VSCC Table** section holds the JEDEC ID and the VSCC (Vendor Specific Component Capabilities) information of the entire SPI Flash supported by the NVM image.
- The **Descriptor Upper Map** section determines the length and base address of the **VSCC Table** section.
- The **OEM Section** is 256 Bytes reserved at the top of the Flash Descriptor for use by an OEM.

31.2.3.1 Master Section

The Master section defines read and write access setting for each region of the SPI device, when the SPI controller is running in Descriptor mode. The master region recognize twos masters: SoC CPU core running BIOS code and the Trusted Execution Engine.

Note: Each master is only allowed to do direct reads of its primary regions. The Trusted Execution Engine is may also do a direct read of the BIOS region if it has been given read access to that region. See Section 31.2.4.1, "Direct Access" on page 4382 for further details on direct reads.

Table 301. Region Access Control

Master Read/Write Access		
Region	**BIOS**	**Trusted Execution Engine**
Descriptor	N/A	N/A
BIOS	CPU core and BIOS can always read from and write to BIOS Region	Read / Write
Trusted Execution Engine	Read / Write	Trusted Execution can always read from and write to Trusted Execution Engine Region
Platform Data	N/A	N/A

31.2.3.2 Invalid Flash Descriptor Handling

The SoC will respond to an invalid Flash Descriptor with the following:

- The SPI controller will operate in Non-Descriptor mode.
- If the BBS strap (see Section 31.2.2 for details) is set to 1, BIOS direct read access will be forwarded to the SPI Controller without any address translation.
- The HSFSTS.FDV register bits remains at 0b.

- All security checks are disabled and the entire Flash is open for reading and writing. No restriction on the 4k crossing.
- Trusted Execution Engine direct read accesses will not be handled, and the SPI controller will return all 1's.

Note: To ensure BIOS boot access even when the Flash Descriptor is invalid the BIOS region can be placed at the top of Flash Component 0. Placing the BIOS region in any other location will necessitate a full reprogramming of the Flash before boot is possible from that Flash.

31.2.3.3 Descriptor Security Override Strap

A strap is implemented on GPIO_S0_SC[065] to allow descriptor security to be overridden when the strap is sampled low.

If the strap is set (0b), it will have the following effect:

- The Master Region Read Access and Master Region Write Access permissions that were loaded from the Flash Descriptor Master Section will be overridden giving every master read and write permissions to the entire Flash component including areas outside the defined regions.
- BIOS Protected Range 4 (PR4), if enabled by soft strap, will be overridden so that all masters are able to write to the PR4. The PR4 base and limit addresses are fetched and received from soft strap.

31.2.4 Flash Access

There are two types of Flash accesses: Direct Access and Program Register Access.

31.2.4.1 Direct Access

- Direct writes are not allowed for any master.
- The SoC CPU core is only allowed to do a direct read of the BIOS region
- The Trusted Execution Engine is only allowed to do a direct read of the Trusted Execution Engine region. It may also do a direct read of the BIOS region if it has been given read access to that region.

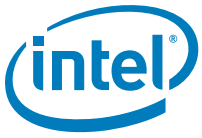
Note: Trusted Execution Engine region direct reads are not supported when the SPI controller is operating in Non-Descriptor mode. The SPI controller returns all 1s if a direct read is attempted.

31.2.4.2 Security

- Calculated Flash Linear Address (FLA) must fall between primary region base/limit

Note: During non descriptor mode, the Flash Physical Address is used instead. Only the two BIOS ranges at the E0000h and F0000h segments just below 1MB are supported.

- Direct Read Cache contents are reset to 0's on a read from a different master



31.2.4.3 Program Register Access

- Reads, Writes and Erases are all supported.
- Program Register Access may use Hardware or Software Sequencing. See Section 31.3.1, "Hardware vs. Software Sequencing" on page 4389 for further information.
- Program Register Accesses are not allowed to cross a 4 KB boundary and can not issue a command that might extend across two components
- Software programs the FLA corresponding to the region desired
  - Software must read the devices Primary Region Base/Limit address to create a FLA.

Each master accesses the Flash through a set of memory mapped registers that are dedicated to each device.

There are two separate control and status registers that software can use when using register access to the Flash. The Hardware Sequencing control/status registers rely on hardware to issue appropriate Flash instructions and atomic sequences. The Software Sequencer puts control into the hands of the software for what instructions to issue and when.

The goal is to support all Flash components through hardware sequencing. Software sequencing is intended only for a back-up strategy.

Note: Software sequencing is required when operating in a non-descriptor mode.

31.2.4.4 Security

- Only primary region masters can access the registers
- Masters are only allowed to read or write those regions they have read/write permission
- Using the Flash region access permissions, one master can give another master read/write permissions to their area
- Using the five Protected Range registers, each master can add separate read/write protection above that granted in the Flash Descriptor for their own accesses
  - Example: BIOS may want to protect different regions of BIOS from being erased
  - Ranges can extend across region boundaries

31.2.5 Serial Flash Device Compatibility Requirements

A variety of serial Flash devices exist in the market. For a serial Flash device to be compatible with the SoC SPI bus, it must meet the minimum requirements detailed in the following sections.

31.2.5.1 BIOS SPI Flash Requirements

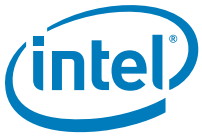
The SPI Flash device must meet the following minimum requirements when used explicitly for system BIOS storage.

- Erase size capability of at least one of the following: 64 Kbytes, 8 Kbytes, 4 Kbytes, or 256 bytes.
- Device must support multiple writes to a page without requiring a preceding erase cycle (Refer to Section 31.2.6.)
- Serial Flash device must ignore the upper address bits such that an address of FFFFFFh aliases to the top of the Flash memory.
- SPI Compatible Mode 0 support (clock phase is 0 and data is latched on the rising edge of the clock).
- If the device receives a command that is not supported or incomplete (less than 8 bits), the device must complete the cycle gracefully without any impact on the Flash content.
- An erase command (page, sector, block, chip, etc.) must set all bits inside the designated area (page, sector, block, chip, etc.) to 1 (Fh).
- Status Register bit 0 must be set to 1 when a write, erase or write to status register is in progress and cleared to 0 when a write or erase is NOT in progress.
- Devices requiring the Write Enable command must automatically clear the Write Enable Latch at the end of Data Program instructions.
- Byte write must be supported. The flexibility to perform a write between 1 byte to 64 bytes is recommended.
- Hardware Sequencing requirements are optional in BIOS only platforms.
- SPI Flash devices that do not meet hardware sequencing command set requirements may work in BIOS only platforms using software sequencing.
- If implementing two SPI flash devices, both devices must have the same erasable block/sector size. Additionally, the first device must be of a binary size.

31.2.5.2 Intel Trusted Execution Engine Firmware SPI Flash Requirements

Intel Trusted Execution Engine Firmware must meet all the requirements in Section 31.2.5.1 plus:

- Hardware sequencing
- The Flash device must have a uniform 4-KB erasable block throughout the entire device or have 64 KB blocks with the first block (lowest address) divided into 4-KB or 8-KB blocks.
- The write protection scheme must meet SPI Flash unlocking requirements for the Trusted Execution Engine



SPI Flash Unlocking Requirements for the Trusted Execution Engine

Flash devices must be globally unlocked (read, write and erase access on the Trusted Execution Engine region) from power on by writing 00h to the Flash's status register to disable write protection.

If the status register must be unprotected, it must use the enable write status register command 50h or write enable 06h.

Opcode 01h (write to status register) must then be used to write a single byte of 00h into the status register. This must unlock the entire device. If the SPI Flash's status register has non-volatile bits that must be written to, bits [5:2] of the Flash's status register must be all 0h to indicate that the Flash is unlocked.

If bits [5:2] return a non zero values, the Trusted Execution Engine firmware will send a write of 00h to the status register. This must keep the Flash part unlocked.

If there is no need to execute a write enable on the status register, then opcodes 06h and 50h must be ignored.

After global unlock, the BIOS has the ability to lock down small sections of the Flash as long as they do not involve the Trusted Execution Engine.

31.2.5.3 Hardware Sequencing Requirements

Below table contains a list of commands and the associated opcodes that a SPI-based serial Flash device must support in order to be compatible with hardware sequencing.

Table 302. Hardware Sequencing Commands and Opcode Requirements

Commands	Opcode	Notes
Write to Status Register	01h	Writes a byte to SPI Flash's status register. Enable Write to Status Register command must be run prior to this command.
Program Data	02h	Single byte or 64 byte write as determined by Flash part capabilities and software.
Read Data	03h	
Write Disable	04h	
Read Status	05h	Outputs contents of SPI Flash's status register
Write Enable	06h	
Fast Read	0Bh	
Enable Write to Status Register	50h	Enables a bit in the status register to allow an update to the status register
Erase	Programmable	Uses the value from LVSSC.LEO register or UVSSC.UEO register depending on the FLA and whether it is below or above the FPBA respectively

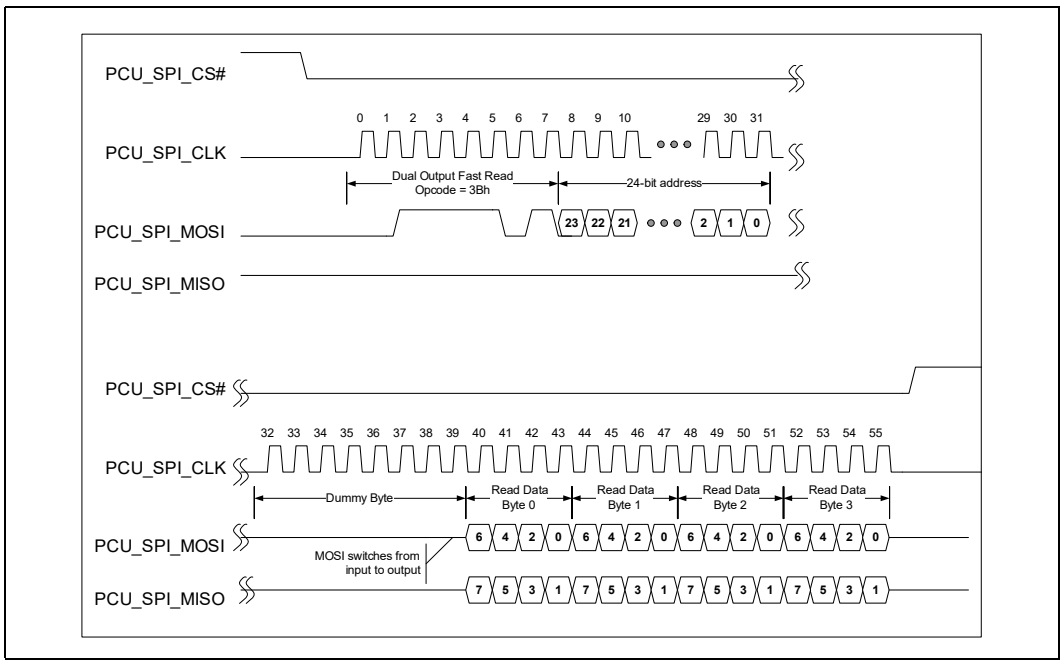
Single Input, Dual Output Fast Read

The SPI controller supports the functionality of a single input, dual output fast read: Opcode 3Bh. This instruction has the same timing (including a dummy byte) and the same frequencies as the Fast Read instruction, with the difference that the read data from the Flash is presented on both the MISO and MOSI pins. During a Dual Read instruction, the odd data bits are on the MISO pin and the even data bits are on the MOSI pin.

Note: When Dual Output Fast Read Support is enabled the Fast Read Support must be enabled as well.

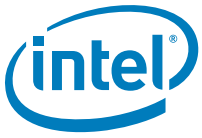
Note: Micronix* SPI Flash uses a different opcode for dual fast read, and requires that during the address phase that the address bits are sent on both MOSI and MISO. The SoC does not support this implementation of the protocol.

Figure 132.Dual Output Fast Read Timing



JEDEC ID

Since each serial Flash device may have unique capabilities and commands, the JEDEC ID is the necessary mechanism for identifying the device so the uniqueness of the device can be comprehended by the controller (master). The JEDEC ID uses the opcode 9Fh and a specified implementation and usage model. This JEDEC Standard Manufacturer and Device ID read method is defined in Standard JESD21-C, PRN03-NV.



Error Correction and Detection

If the first 8 bits specify an opcode which is not supported the slave will not respond and wait for the next high to low transition on PCU_SPI_CS[1:0]#. The SPI controller should automatically discard 8 bit words that were not completely received upon de-assertion of the signal.

Any other error correction or detection mechanisms must be implemented in firmware and/or software.

31.2.6 Multiple Page Write Usage Model

The BIOS and Trusted Execution Engine firmware usage models require that the serial Flash device support multiple writes to a page (minimum of 512 writes) without requiring a preceding erase command. The BIOS commonly uses capabilities such as counters that are used for error logging and system boot progress logging. These counters are typically implemented by using byte-writes to 'increment' the bits within a page that have been designated as the counter. The Trusted Execution Engine firmware usage model requires the capability for multiple data updates within any given page. These data updates occur using byte-writes without executing a preceding erase to the given page. Both the BIOS and Trusted Execution Engine firmware multiple page write usage models apply to sequential and non-sequential data writes.

This usage model requirement is based on any given bit only being written once from a '1' to a '0'without requiring the preceding erase. An erase would be required to change bits back to the 1 state.

31.2.7 Soft Flash Protection

There are two types of Flash protection that are not defined in the Flash descriptor supported by the SPI controller:

1. Flash Range Read and Write Protection
2. Global Write Protection

31.2.7.1 Flash Range Read and Write Protection

The SPI controller provides a method for blocking reads and writes to specific ranges in the Flash when the Protected Ranges are enabled. This is achieved by checking the read or write cycle type and the address of the requested command against the base and limit fields of a Read or Write Protected range. Protected range registers are only applied to Programmed Register accesses and have no effect on Direct Reads.

Note: Once BIOS has locked down the Protected BIOS Range registers, this mechanism remains in place until the next system reset.

31.2.7.2 Global Write Protection

The SPI controller has a Write Protection Disable (BCR.WPD) configuration bit. When BCR.WPD=0b, BIOS is not able to perform any write or erase commands to the Flash. When BCR.WPD=1b, protection against BIOS erase and rewrite is disabled. When the lock enable (BCR.LE) bit is set, the BIOS can disable this protection only during System Management Mode (SMM) execution.

If BCR.LE=1b, the SPI controller confirms that only SMM code succeeds to set BCR.WPD=1b. In addition, if BCS.SMIWPEN=1b, the SPI controller should initiate an SMI when non SMM code tries to set BCR.WPD=1b.

31.2.8 SPI Flash Device Recommended Pinout

This table contains the recommended serial Flash device pin-out for an 8-pin device. Use of the recommended pin-out on an 8-pin device reduces complexities involved with designing the serial Flash device onto a motherboard and allows for support of a common footprint usage model (refer to Section 31.2.9.1).

Table 303. Recommended Pinout for 8-Pin Serial Flash Device

Pin #	Signal
1	Chips Select
2	Data Output
3	Write Protect
4	Ground
5	Data Input
6	Serial Clock
7	Hold / Reset
8	Supply Voltage

Although an 8-pin device is preferred over a 16-pin device due to footprint compatibility, Table 304 contains the recommended serial Flash device pin-out for a 16-pin SOIC.

31.2.9 Serial Flash Device Package

Table 304. Recommended Pinout for 16-Pin Serial Flash Device

Pin #	Signal	Pin #	Signal
1	Hold / Reset	9	Write Protect
2	Supply Voltage	10	Ground
3	No Connect	11	No Connect
4	No Connect	12	No Connect
5	No Connect	13	No Connect

Table 304. Recommended Pinout for 16-Pin Serial Flash Device

Pin #	Signal	Pin #	Signal
6	No Connect	14	No Connect
7	Chip Select	15	Serial Data In
8	Serial Data Out	16	Serial Clock

31.2.9.1 Common Footprint Usage Model

To minimize platform motherboard redesign and to enable platform Bill of Material (BOM) selectability, many OEMs design their motherboard with a single common footprint. This common footprint allows the population of a soldered down device or a socket that accepts a leadless device. This enables the board manufacturer to support, using selection of the appropriate BOM, either of these solutions on the same system without requiring any board redesign.

The common footprint usage model is desirable during system debug and by Flash content developers since the leadless device can be easily removed and reprogrammed without damage to device leads. When the board and Flash content is mature for high-volume production, both the socketed leadless solution and the soldered down leaded solution are available through BOM selection.

31.2.9.2 Serial Flash Device Package Recommendations

It is highly recommended that the common footprint usage model be supported. An example of how this can be accomplished is as follows:

- The recommended pinout for 8-pin serial Flash devices is used (refer to Table 303).
- The 8-pin device is supported in either an 8-contact VDFPN (6x5 mm MLP) package or an 8-contact WSON (5x6 mm) package. These packages can fit into a socket that is land pattern compatible with the wide body SO8 package.
- The 8-pin device is supported in the SO8 (150 mil) and in the wide-body SO8 (200 mil) packages.
- The 16-pin device is supported in the SO16 (300 mil) package.

31.3 Use

31.3.1 Hardware vs. Software Sequencing

Hardware and Software sequencing are the two methods the SoC uses to communicate with the Flash via programming registers for each of the three masters.

31.3.1.1 Hardware Sequencing

Hardware sequencing has a predefined list of opcodes, see Table 302 for more details, with only the erase opcode being programmable. This mode is only available if the descriptor is present and valid. Security Engine firmware must use HW sequencing, so

BIOS must properly set up the SoC to account for this. The Host VSCC registers and VSCC Table have to be correctly configured for BIOS and Security Engine have read/write access to SPI.

31.3.1.2 Software Sequencing

All commands other than the standard (memory) reads must be programmed by the software in the Software Sequencing Control, Flash Address, Flash Data, and Opcode configuration registers. Software must issue either Read ID or Read JEDEC ID, or a combination of the two to determine what Flash component is attached. Based on the Read ID, software can determine the appropriate Opcode instructions sets to set in the program registers and at what SPI frequency to run the command.

Software must program the Flash Linear Address for all commands, even for those commands that don't require address such as the Read ID or Read Status. This is because the SPI controller uses the address to determine which chip select to use.

The opcode type and data byte count fields determine how many clocks to run before deasserting the chip enable. The Flash data is always shifted in for the number of bytes specified and the Flash Data out is always shifted out for the number of data bytes specified. Note that the hardware restricts the burst lengths that are allowed.

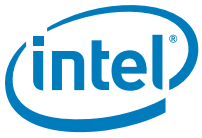
A status bit indicates when the cycle has completed on the SPI port allowing the host to know when read results can be checked and/or when to initiate a new command.

The controller also provides the “Atomic Cycle Sequence” for performing erases and writes to the SPI Flash. When this bit is 1 (and the Go bit is written to 1), a sequence of cycles is performed on the SPI interface without allowing other SPI device to arbitrate and interleave cycles to the Flash device. In this case, the specified cycle is preceded by the Prefix Command (8-bit programmable Opcode) and followed by repeated reads to the Status Register (Opcode 05h) until bit 0 indicates the cycle has completed. The hardware does not attempt to check that the programmed cycle is a write or erase.

If a Programmed Access is initiated (Cycle Go written to 1) while the SPI controller is already busy with a Direct Memory Read, then the SPI Host hardware will hold the new Programmed Access pending until the preceding SPI access completes.

Once the SPI controller has committed to running a programmed access, subsequent writes to the programmed cycle registers that occur before it has completed will not modify the original transaction and will result in the assertion of the FCERR bit. Software should never purposely behave in this way and rely on this behavior. However, the FCERR bit provides basic error-reporting in this situation. Writes to the following registers cause the FCERR bit assertion in this situation:

- Software Sequencing Control
- Software Sequencing Address
- SPI Data



With the exception of Illegal Opcodes, the SPI controller does not police which opcodes are valid to be used in SW Sequencing. For example, if SW programs a Dual Output Fast Read opcode, then the Dual Output Fast Read cycle will be issued, independent of whether the Dual Output Fast Read enable bit was set in the component descriptor section.

31.4 Register Map

Refer to Chapter 3, "Register Access Methods" and Chapter 4, "Mapping Address Spaces" for additional information.

31.5.1 BFPREG (BIOS_Flash_Primary_Region_bios)—Offset 0h

BIOS flash primary region addresses

Access Method

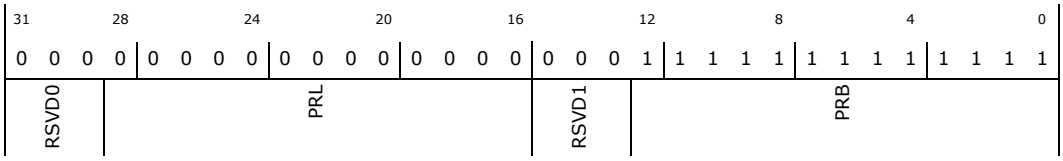
Type: Memory Mapped I/O Register (Size: 32 bits)

BIOS_Flash_Primary_Region_bios: [SPI_BASE_ADDRESS] + 0h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00001FFFh



Bit Range	Default & Access	Description
31:29	0b RO	**RSVD0:** Reserved
28:16	0000h RO	**BIOS Flash Primary Region Limit (PRL):** This specifies address bits 24:12 for the Primary Region Limit. The value in this register loaded from the contents in the Flash Descriptor.FLREG1.Region Limit
15:13	0b RO	**RSVD1:** Reserved
12:0	1FFFh RO	**BIOS Flash Primary Region Base (PRB):** This specifies address bits 24:12 for the Primary Region Base The value in this register iloaded from the contents in the Flash Descriptor.FLREG1.Region Base

31.5.2 HSFSTS (Hardware_Sequencing_Flash_Status_bios)—Offset 4h

Hardware sequencing flash status Note: If operating in Non-Descriptor mode, the Software Sequencing Flash Status register must be used.

Access Method

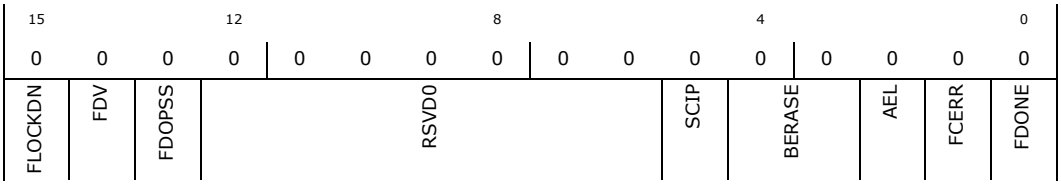
Type: Memory Mapped I/O Register (Size: 16 bits)

Hardware_Sequencing_Flash_Status_bios: [SPI_BASE_ADDRESS] + 4h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 0000h



Bit Range	Default & Access	Description
15	0b RW/L	**Flash Configuration Lock-Down (FLOCKDN):** When set to 1, those Flash Program Registers that are locked down by this FLOCKDN bit cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
14	0b RO	**Flash Descriptor Valid (FDV):** This bit is set to a 1 if the Flash Controller read the correct Flash Descriptor Signature. If the Flash Descriptor Valid bit is not 1 , software cannot use the Hardware Sequencing registers, but must use the software sequencing registers. Any attempt to use the Hardware Sequencing registers will result in the FCERR bit being set.
13	0b RO	**Flash Descriptor Override Pin-Strap Status (FDOPSS):** This register reflects the value the Flash Descriptor Override Pin-Strap. '1': No override '0': The Flash Descriptor Overide strap is set
12:6	0b RO	**RSVD0:** Reserved
5	0b RO	**SPI Cycle In Progress (SCIP):** Hardware sets this bit when software sets the Flash Cycle Go (FGO) bit in the Hardware Sequencing Flash Control register. This bit remains set until the cycle completes on the SPI interface. Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0.
4:3	00b RO	**Block/Sector Erase Size (BERASE):** This field identifies the erasable sector size for all Flash components. Valid Bit Settings: 00 : 256 Byte 01 : 4K Byte 10 : 8K Byte 11 : 64K Byte If the FLA (FPBA then this field reflects the value in the LVSCC.LBES register. If the FLA)= FPBA then this field reflects the value in the UVSCC.UBES register.
2	0b RW/1C	**Access Error Log (AEL):** Hardware sets this bit to a 1 when a direct read was made by BIOS that violated the security restrictions. Or , when a SB transaction to read/write one of the BIOS registers was accepted with bad SAI - see security table. This bit has no affect on indirect accesses. This bit is cleared by software writing a 1.
1	0b RW/1C	**Flash Cycle Error (FCERR):** Hardware sets this bit to 1 when an program register access is blocked to the FLASH due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1 or until hardware reset occures. Software must clear this bit before setting the FLASH Cycle GO bit in this register.

Bit Range	Default & Access	Description
0	0b RW/1C	**Flash Cycle Done (FDONE):** The SPI controller sets this bit to 1 when the SPI Cycle completes after software previously set the FGO bit. This bit remains asserted until cleared by software writing a 1 or hardware reset. When this bit is set and the SPI SMI# Enable bit is set, an internal signal is asserted to the SMI# generation block. Software must make sure this bit is cleared prior to enabling the SPI SMI# assertion for a new programmed access.

31.5.3 HSFCTL (Hardware_Sequencing_Flash_Control_bios)—Offset 6h

Hardware sequencing flash control.

Access Method

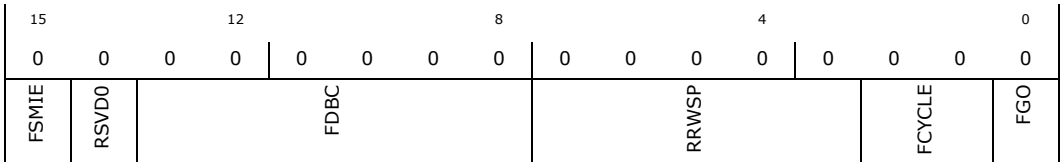
Type: Memory Mapped I/O Register (Size: 16 bits)

Hardware_Sequencing_Flash_Control_bios: [SPI_BASE_ADDRESS] + 6h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 0000h



Bit Range	Default & Access	Description
15	0b RW	**Flash SPI SMI# Enable (FSMIE):** When set to 1, the SPI asserts an SMI# request whenever the Flash Cycle Done bit is 1.
14	0b RO	**RSVD0:** Reserved
13:8	00h RW	**Flash Data Byte Count (FDBC):** This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The contents of this register are 0s based with 0b reprenting 1 byte and 111111b representing 64 bytes. The number of bytes transferred is the value of this field plus 1. This field is ignored for the Block Erase command.
7:3	00h RW	**Reserved RW Scratch Pad (RRWSP):** Reserved: Scratch Pad bits that are R/W to be used during ECO
2:1	00b RW	**FLASH Cycle (FCYCLE):** This field defines the Flash SPI cycle type generated to the FLASH when the FGO bit is set as defined below: 00 Read (1 up to 64 bytes by setting FDBC) 01 Reserved 10 Write (1 up to 64 bytes by setting FDBC) 11 Block Erase Implementation Note: if reserved 2'b01 is programmed to this field, flash controller will handle it as if it is 00 (Read)
0	0b RW/SE	**Flash Cycle Go (FGO):** A write to this register with a 1 in this bit initiates a request to the Flash SPI Arbiter to start a cycle. This register is cleared by hardware when the cycle is granted by the SPI arbiter to run the cycle on the SPI bus. When the cycle is complete, the FDONE bit is set. Software is forbidden to write to any register in the HSFLCTL register between the FGO bit getting set and the FDONE bit being cleared. Any attempt to violate this rule will be ignored by hardware. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write. This bit always returns 0 on reads.

31.5.4 FADDR (Flash_Address_bios)—Offset 8h

Flash address

Access Method

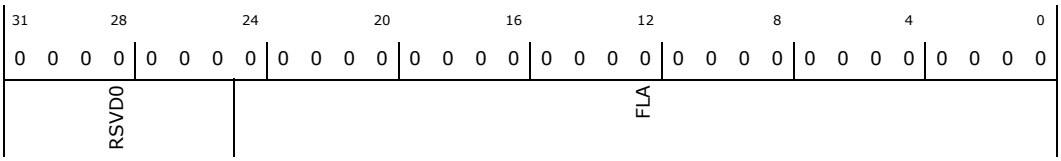
Type: Memory Mapped I/O Register (Size: 32 bits)

Flash_Address_bios: [SPI_BASE_ADDRESS] + 8h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000000h



Bit Range	Default & Access	Description
31:25	0b RO	**RSVD0:** Reserved
24:0	00000000h RW	**Flash Linear Address (FLA):** The FLA is the starting byte linear address of a SPI Read or Write cycle or an address within a Block for the Block Erase command. The Flash Linear Address must fall within a region for which BIOS has access permissions. Hardware must convert the FLA into a Flash Physical Address (FPA) before running this cycle on the SPI bus. When operating in Tekoa mode bit 24 is ignored and the FLA[lb]13:0[rb] is the FPA.

31.5.5 FDATA0 (Flash_Data_0_bios)—Offset 10h

Flash data #0

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

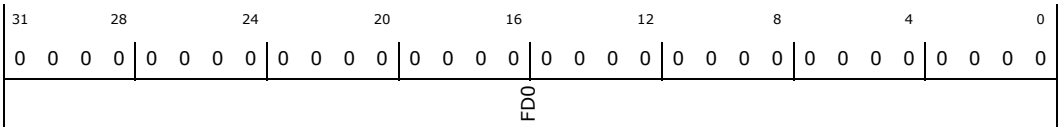
Flash_Data_0_bios: [SPI_BASE_ADDRESS] + 10h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 0 (FD0):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- 8-23-22- 16-31 24 Bit 24 is the last bit shifted out/in. There are no alignment assumptions, byte 0 always represents the value specified by the cycle address. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

31.5.6 FDATA1 (Flash_Data_1_bios)—Offset 14h

Flash data #1

Access Method

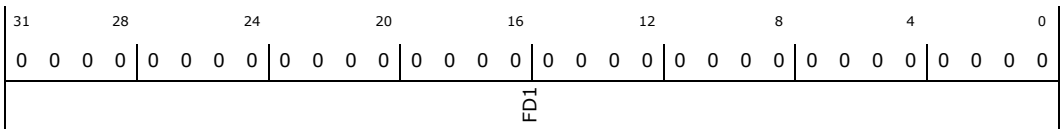
Type: Memory Mapped I/O Register (Size: 32 bits)

Flash_Data_1_bios: [SPI_BASE_ADDRESS] + 14h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 1 (FD1):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD0 has completely shifted in/out.

31.5.7 FDATA2 (Flash_Data_2_bios)—Offset 18h

Flash data #2

Access Method

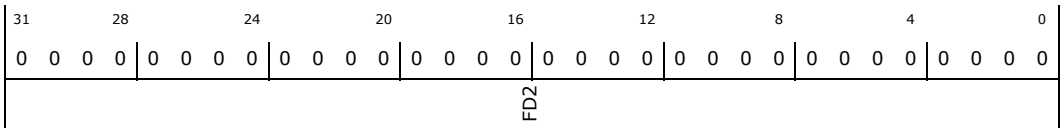
Type: Memory Mapped I/O Register (Size: 32 bits)

Flash_Data_2_bios: [SPI_BASE_ADDRESS] + 18h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 2 (FD2):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD1 has completely shifted in/out.

31.5.8 FDATA3 (Flash_Data_3_bios)—Offset 1Ch

Flash data #3

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

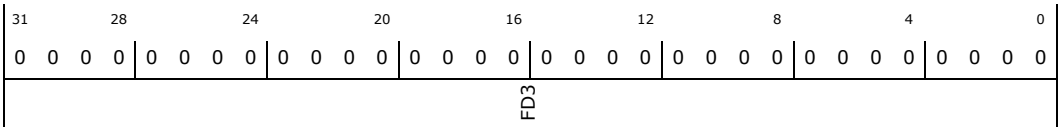
Flash_Data_3_bios: [SPI_BASE_ADDRESS] + 1Ch

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 3 (FD3):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD2 has completely shifted in/out.

31.5.9 FDATA4 (Flash_Data_4_bios)—Offset 20h

Flash data #4

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

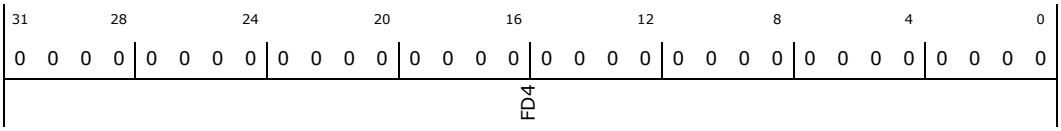
Flash_Data_4_bios: [SPI_BASE_ADDRESS] + 20h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 4 (FD4):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD3 has completely shifted in/out.

31.5.10 FDATA5 (Flash_Data_5_bios)—Offset 24h

Flash data #5

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

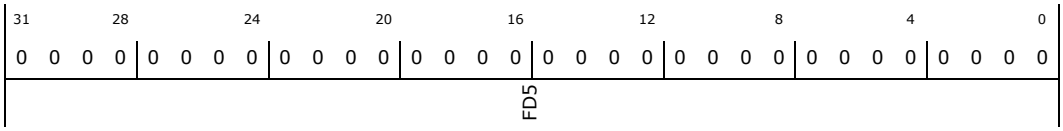
Flash_Data_5_bios: [SPI_BASE_ADDRESS] + 24h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 5 (FD5):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD4 has completely shifted in/out.

31.5.11 FDATA6 (Flash_Data_6_bios)—Offset 28h

Flash data #6

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

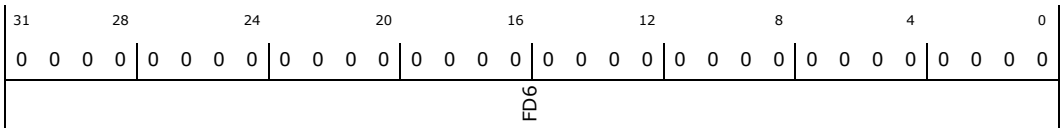
Flash_Data_6_bios: [SPI_BASE_ADDRESS] + 28h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 6 (FD6):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD5 has completely shifted in/out.

31.5.12 FDATA7 (Flash_Data_7_bios)—Offset 2Ch

Flash data #7

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

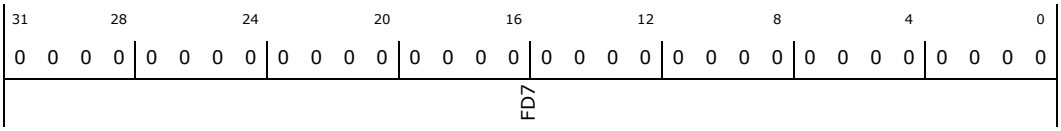
Flash_Data_7_bios: [SPI_BASE_ADDRESS] + 2Ch

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 7 (FD7):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD6 has completely shifted in/out.

31.5.13 FDATA8 (Flash_Data_8_bios)—Offset 30h

Flash data #8

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

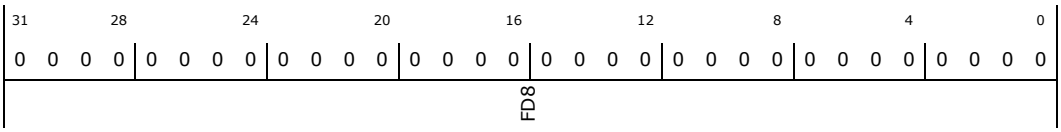
Flash_Data_8_bios: [SPI_BASE_ADDRESS] + 30h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 8 (FD8):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD7 has completely shifted in/out.

31.5.14 FDATA9 (Flash_Data_9_bios)—Offset 34h

Flash data #9

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

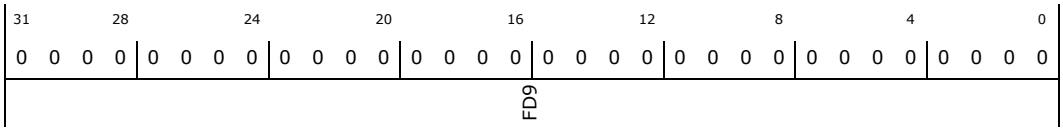
Flash_Data_9_bios: [SPI_BASE_ADDRESS] + 34h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 9 (FD9):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD8 has completely shifted in/out.

31.5.15 FDATA10 (Flash_Data_10_bios)—Offset 38h

Flash data #10

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

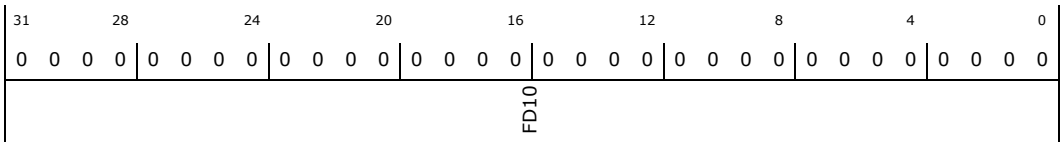
Flash_Data_10_bios: [SPI_BASE_ADDRESS] + 38h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 10 (FD10):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD9 has completely shifted in/out.

31.5.16 FDATA11 (Flash_Data_11_bios)—Offset 3Ch

Flash data #11

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

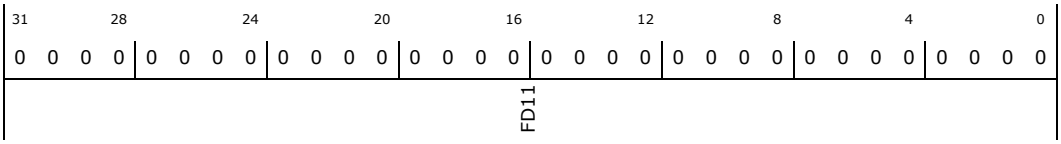
Flash_Data_11_bios: [SPI_BASE_ADDRESS] + 3Ch

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 11 (FD11):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD10 has completely shifted in/out.

31.5.17 FDATA12 (Flash_Data_12_bios)—Offset 40h

Flash data #12

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

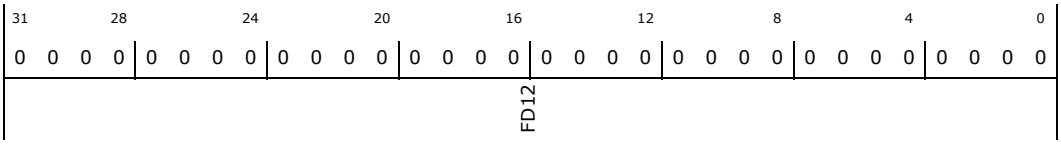
Flash_Data_12_bios: [SPI_BASE_ADDRESS] + 40h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 12 (FD12):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD11 has completely shifted in/out.

31.5.18 FDATA13 (Flash_Data_13_bios)—Offset 44h

Flash data #13

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

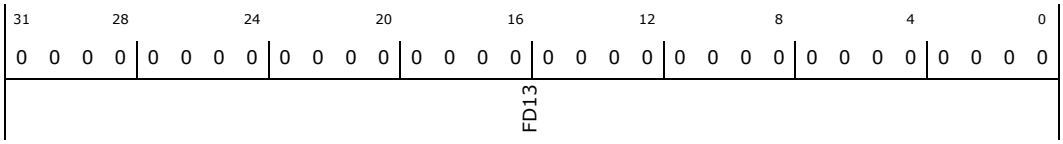
Flash_Data_13_bios: [SPI_BASE_ADDRESS] + 44h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 13 (FD13):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD12 has completely shifted in/out.

31.5.19 FDATA14 (Flash_Data_14_bios)—Offset 48h

Flash data #14

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

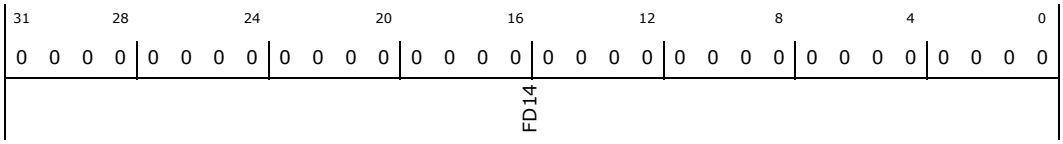
Flash_Data_14_bios: [SPI_BASE_ADDRESS] + 48h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 14 (FD14):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD13 has completely shifted in/out.

31.5.20 FDATA15 (Flash_Data_15_bios)—Offset 4Ch

Flash data #15

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

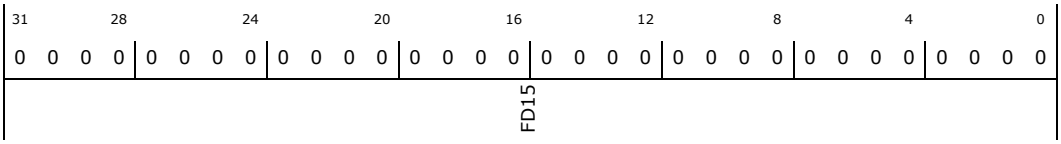
Flash_Data_15_bios: [SPI_BASE_ADDRESS] + 4Ch

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Flash Data 15 (FD15):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD14 has completely shifted in/out.

31.5.21 FRACC (Flash_Region_Access_Permissions_bios)—Offset 50h

Flash region access permissions

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

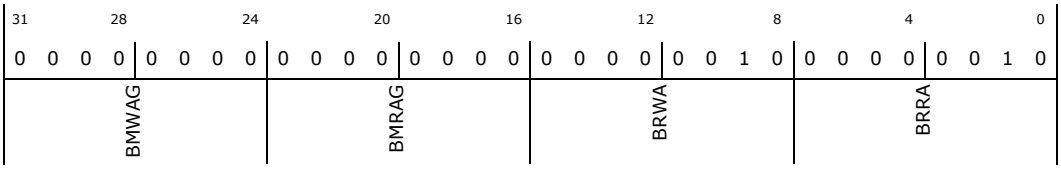
Flash_Region_Access_Permissions_bios: [SPI_BASE_ADDRESS] + 50h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000202h



Bit Range	Default & Access	Description
31:24	00h RW/L	**BIOS Master Write Access Grant (BMWAG):** Each bit [lb]31:24[rb] corresponds to Master[lb]7:0[rb]. BIOS can grant one or more masters write access to the BIOS region 1 overriding the permissions in the Flash Descriptor. Master[lb]1[rb] is Host CPU/BIOS, Master[lb]2[rb] is SEC, Master[lb]3[rb] is GBE. Master[lb]0[rb] and Master[lb]7:4[rb] are reserved. The contents of this register are locked by the FLOCKDN or BMWAGLOCKDN bits.

Bit Range	Default & Access	Description
23:16	00h RW/L	**BIOS Master Read Access Grant (BMRAG):** Each bit [lb]23:16[rb] corresponds to Master[lb]7:0[rb]. BIOS can grant one or more masters read access to the BIOS region 1 overriding the read permissions in the Flash Descriptor. Master[lb]1[rb] is Host CPU/ BIOS, Master[lb]2[rb] is SEC, Master[lb]3[rb] is GBE. Master[lb]0[rb] and Master[lb]7:4[rb] are reserved. The contents of this register are locked by the FLOCKDN or BMRAGLOCKDN bit.
15:8	02h RO	**BIOS Region Write Access (BRWA):** Each bit [lb]15:8[rb] corresponds to Regions [lb]7:0[rb]. If the bit is set, this master can erase and write that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS write permissions in their Master Write Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS always have the write access to its own Region 1 by default. Thus, the reset default of this field will be read as 8'h02 regardless of descriptor or non-descriptor mode.
7:0	02h RO	**BIOS Region Read Access (BRRA):** Each bit [lb]7:0[rb] corresponds to Regions [lb]7:0[rb]. If the bit is set, this master can read that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS read permissions in their Master Read Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS always have the read access to its own Region 1 by default. Thus, the reset default of this field will be read as 8'h02 regardless of descriptor or non-descriptor mode.

31.5.22 FREG0 (Flash_Region_0_bios)—Offset 54h

Flash region 0 (flash descriptor)

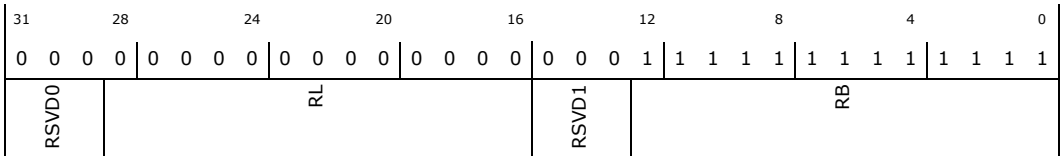
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Flash_Region_0_bios: [SPI_BASE_ADDRESS] + 54h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00001FFFh



Bit Range	Default & Access	Description
31:29	0b RO	**RSVD0:** Reserved
28:16	0000h RO	**Region Limit (RL):** This specifies address bits 24:12 for the Region 0 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Limit
15:13	0b RO	**RSVD1:** Reserved
12:0	1FFFh RO	**Region Base (RB):** This specifies address bits 24:12 for the Region 0 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Base

31.5.23 FREG1 (Flash_Region_1_bios)—Offset 58h

Flash region 1 (BIOS)

Access Method

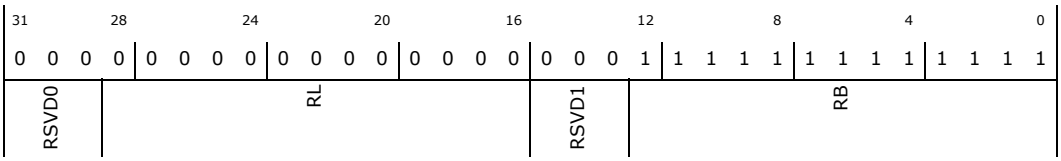
Type: Memory Mapped I/O Register (Size: 32 bits)

Flash_Region_1_bios: [SPI_BASE_ADDRESS] + 58h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00001FFFh



Bit Range	Default & Access	Description
31:29	0b RO	**RSVD0:** Reserved
28:16	0000h RO	**Region Limit (RL):** This specifies address bits 24:12 for the Region 1 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Limit
15:13	0b RO	**RSVD1:** Reserved
12:0	1FFFh RO	**Region Base (RB):** This specifies address bits 24:12 for the Region 1 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Base

31.5.24 FREG2 (Flash_Region_2_bios)—Offset 5Ch

Flash region 2 (SEC)

Access Method

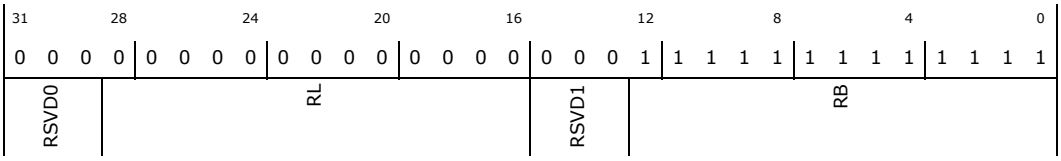
Type: Memory Mapped I/O Register (Size: 32 bits)

Flash_Region_2_bios: [SPI_BASE_ADDRESS] + 5Ch

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00001FFFh



Bit Range	Default & Access	Description
31:29	0b RO	**RSVD0:** Reserved
28:16	0000h RO	**Region Limit (RL):** This specifies address bits 24:12 for the Region 2 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Limit

Bit Range	Default & Access	Description
15:13	0b RO	**RSVD1:** Reserved
12:0	1FFFh RO	**Region Base (RB):** This specifies address bits 24:12 for the Region 2 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Base

31.5.25 FREG3 (Flash_Region_3_bios)—Offset 60h

Flash region 3 (GBE)

Access Method

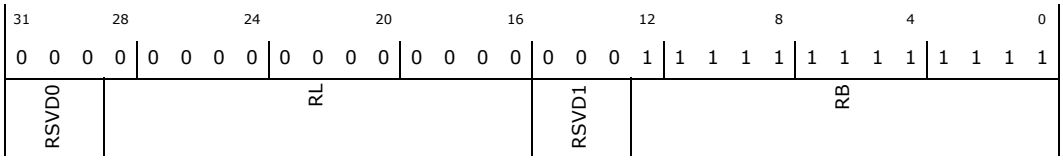
Type: Memory Mapped I/O Register (Size: 32 bits)

Flash_Region_3_bios: [SPI_BASE_ADDRESS] + 60h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00001FFFh



Bit Range	Default & Access	Description
31:29	0b RO	**RSVD0:** Reserved
28:16	0000h RO	**Region Limit (RL):** This specifies address bits 24:12 for the Region 3 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG3.Region Limit
15:13	0b RO	**RSVD1:** Reserved
12:0	1FFFh RO	**Region Base (RB):** This specifies address bits 24:12 for the Region 3 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG3.Region Base

31.5.26 FREG4 (Flash_Region_4_bios)—Offset 64h

Flash region 4 (platform data)

Access Method

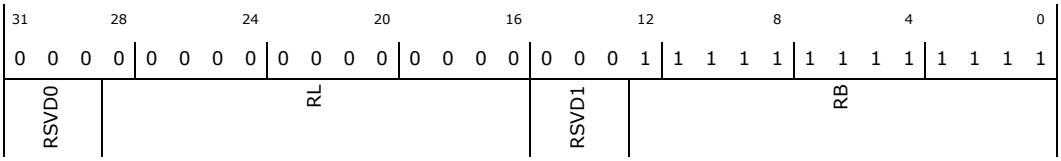
Type: Memory Mapped I/O Register (Size: 32 bits)

Flash_Region_4_bios: [SPI_BASE_ADDRESS] + 64h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00001FFFh



Bit Range	Default & Access	Description
31:29	0b RO	**RSVD0:** Reserved
28:16	0000h RO	**Region Limit (RL):** This specifies address bits 24:12 for the Region 4 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG4.Region Limit
15:13	0b RO	**RSVD1:** Reserved
12:0	1FFFh RO	**Region Base (RB):** This specifies address bits 24:12 for the Region 4 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG4.Region Base

31.5.27 PR0 (Protected_Range_0_bios)—Offset 74h

Protected range #0. This register can not be written when the FLOCKDN or PR0LOCKDN bits are set to 1.

Access Method

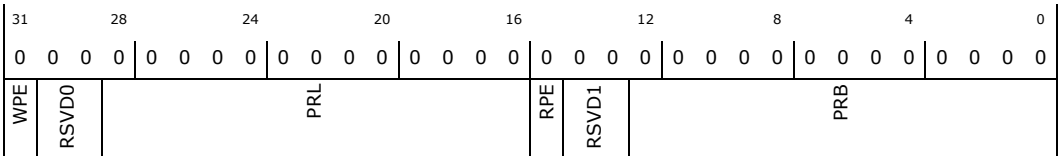
Type: Memory Mapped I/O Register (Size: 32 bits)

Protected_Range_0_bios: [SPI_BASE_ADDRESS] + 74h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:29	0b RO	**RSVD0:** Reserved
28:16	0000h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 24:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be 12'hFFF for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0b RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.

Bit Range	Default & Access	Description
14:13	0b RO	**RSVD1:** Reserved
12:0	0000h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 24:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 12'h000 for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

31.5.28 PR1 (Protected_Range_1_bios)—Offset 78h

Protected range #1. This register can not be written when the FLOCKDN or PR1LOCKDN bits are set to 1.

Access Method

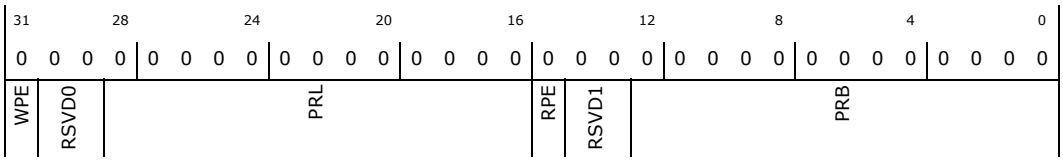
Type: Memory Mapped I/O Register (Size: 32 bits)

Protected_Range_1_bios: [SPI_BASE_ADDRESS] + 78h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:29	0b RO	**RSVD0:** Reserved
28:16	0000h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 24:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be 12'hFFF for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0b RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:13	0b RO	**RSVD1:** Reserved
12:0	0000h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 24:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 12'h000 for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

31.5.29 PR2 (Protected_Range_2_bios)—Offset 7Ch

Protected range #2. This register can not be written when the FLOCKDN or PR2LOCKDN bits are set to 1.

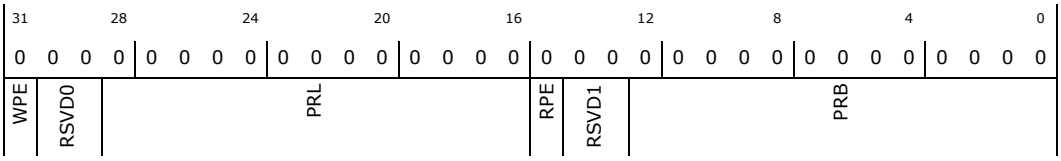
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Protected_Range_2_bios: [SPI_BASE_ADDRESS] + 7Ch

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:29	0b RO	**RSVD0:** Reserved
28:16	0000h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 24:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be 12'hFFF for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0b RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:13	0b RO	**RSVD1:** Reserved
12:0	0000h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 24:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 12'h000 for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

31.5.30 PR3 (Protected_Range_3_bios)—Offset 80h

Protected range #3. This register can not be written when the FLOCKDN or PR3LOCKDN bits are set to 1.

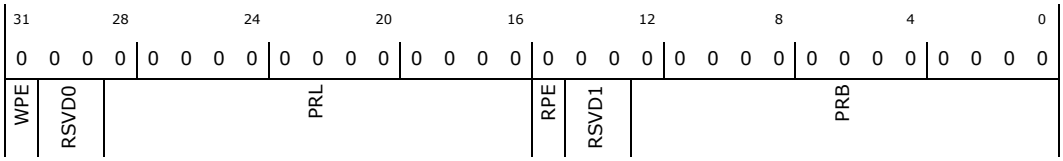
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Protected_Range_3_bios: [SPI_BASE_ADDRESS] + 80h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:29	0b RO	**RSVD0:** Reserved
28:16	0000h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 24:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be 12'hFFF for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0b RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:13	0b RO	**RSVD1:** Reserved
12:0	0000h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 24:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 12'h000 for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

31.5.31 PR4 (Protected_Range_4_bios)—Offset 84h

Protected range #4. This register use for H/W range protection. All register values are coming from soft-straps, and the Write Protection Enable is controlled also by the Flash Security Override Pin Strap

Access Method

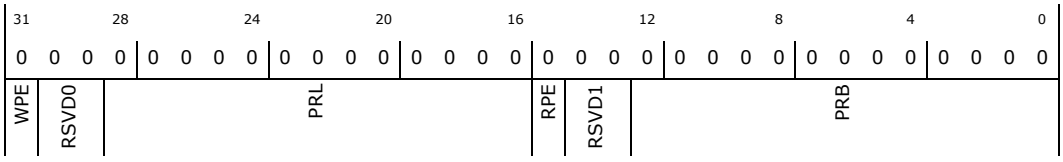
Type: Memory Mapped I/O Register (Size: 32 bits)

Protected_Range_4_bios: [SPI_BASE_ADDRESS] + 84h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000000h



Bit Range	Default & Access	Description
31	X RO	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared. This field value should be an or between soft-strap and the ~Flash Security Override Pin Strap. Such, H/W range protection is active aonly if write protection is enabled by soft-strap and Flash Security Override Pin Strap is deasserted.
30:29	0b RO	**RSVD0:** Reserved
28:16	X RO	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 24:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be 12'hFFF for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range. This field value should be taken from soft-straps.
15	0b RO	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared. This field should be always 1'b0
14:13	0b RO	**RSVD1:** Reserved
12:0	X RO	**Protected Range Base (PRB):** This field corresponds to FLA address bits 24:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 12'h000 for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range. This field value should be taken from soft-straps.

31.5.32 SSFCTLSTS (Software_Sequencing_Flash_Control_Status_bios)—Offset 90h

The software sequencing flash control and Status register is a combination of two registers the software sequencing flash status register (bits 7:0) and the software sequencing flash control register (bits 31:8). This register is intended to be used only as a back-up mode to the hardware sequencing control and status registers.

Access Method

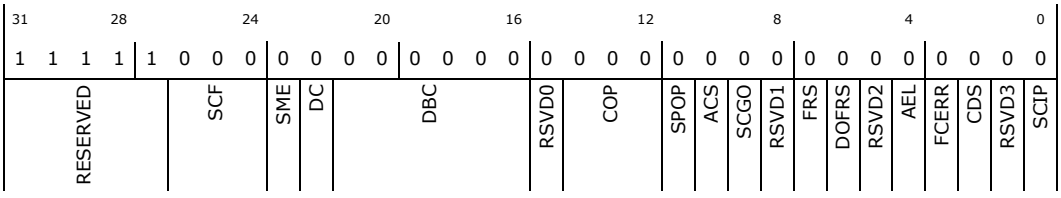
Type: Memory Mapped I/O Register (Size: 32 bits)

Software_Sequencing_Flash_Control_Status_bios: [SPI_BASE_ADDRESS] + 90h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: F8000000h



Bit Range	Default & Access	Description
31:27	11111b RO	**RESERVED:** reserved, should be with default 1

Bit Range	Default & Access	Description
26:24	000b RW/L	**SPI Cycle Frequency (SCF):** 000 : 20MHz 001 : 33MHz 010 : 66MHz (reserved - not supported on VLV) 011 : 25MHz (reserved - not supported on VLV) 100 : 50MHz (reserved - not supported on VLV-DC) All Others: Reserved This register sets frequency to use for all SPI Software Sequencing cycles (write, erase, fast read, read status, .etc) except for the Read cycle which always run at 20MHz. This register is locked when the SPI Configuration Lock-Down bit is set or when FREQLOCKDN bit is set.
23	0b RW	**SPI SMI# Enable (SME):** When set to 1, the SPI asserts an SMI# request whenever the Cycle Done Status bit is 1.
22	0b RW	**Data Cycle (DC):** When set to 1, there is data that corresponds to this transaction. When 0, no data is dleivered for this cycle, and the DBC and data fields themselves are don t cares.
21:16	000000b RW	**Data Byte Count (DBC):** This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The valid settings (in decimal) are any value from 0 to 63. The number of bytes transferred is the value of this field plus 1. Note that when this field is 00_0000b, then there is 1 byte to transfer and that 11_1111b means there are 64 bytes to transfer.
15	0b RO	**RSVD0:** Reserved
14:12	000b RW	**Cycle Opcode Pointer (COP):** This field selects one of the programmed opcodes in the Opcode Menu to be used as the SPI Command/Opcode. In the case of an Atomic Cycle Sequence, this determines the second command.
11	0b RW	**Sequence Prefix Opcode Pointer (SPOP):** This field selects one of the two programmed prefix opcodes for use when performing an Atomic Cycle Sequence. A value of 0 points to the opcode in the least significant byte of the Prefix Opcodes register. By making this programmable, the SPI controller supports flash devices that have different opcodes for enabling writes to the data space vs. status register.
10	0b RW	**Atomic Cycle Sequence (ACS):** When set to 1 along with the SCGO assertion, the SPI controller will execute a sequence of commands on the SPI interface without allowing the LAN component to arbitrate and interleave cycles. The sequence is composed of:) Atomic Sequence Prefix Command (8-bit opcode only)) Primary Command specified below by software (can include address and data)) Polling the Flash Status Register (opcode 8'h05) until bit 0 becomes 1'b0. The SPI Cycle in Progress bit remains set and the Cycle Done Status bit remains unset until the Busy bit in the Flash Status Register returns 0.
9	0b RW/SE	**SPI Cycle Go (SCGO):** This bit always returns 1'b0 on reads. However, a write to this register with a 1'b1 in this bit starts the SPI cycle defined by the other bits of this register. The SPI Cycle in Progress (SCIP) bit gets set by this action. Hardware must ignore writes to this bit while the Cycle In Progress bit is set. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1'b1. This saves an additional memory write.
8	0b RO	**RSVD1:** Reserved
7	0b RO/U	**Fast Read Supported (FRS):** This bit reflects the value of the Fast Read Support bit in the Flash Descriptor Component Section.
6	0b RO/U	**Dual Output Fast Read Supported (DOFRS):** This bit reflects the value of the Dual Output Fast Read Support bit in the Flash Descriptor Component Section.
5	0b RO	**RSVD2:** Reserved
4	0b RO	**Access Error Log (AEL):** This bit reflects the value of the Hardware Sequencing Status.AEL register.
3	0b RW/1C	**Flash Cycle Error (FCERR):** Hardware sets this bit to 1'b1 when a programmed access is blocked from running on the SPI interface due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1'b1 or hardware reset.

Bit Range	Default & Access	Description
2	0b RW/1C	**Cycle Done Status (CDS):** The SPI controller sets this bit to 1'b1 when the SPI Cycle completes i.e., SCIP bit is 1'b0) after software sets the GO bit. This bit remains asserted until cleared by software writing a 1'b1 or hardware reset. When this bit is set and the SPI SMI# Enable bit is set, an internal signal is asserted to the SMI# generation block. Software must make sure this bit is cleared prior to enabling the SPI SMI# assertion for a new programmed access.
1	0b RO	**RSVD3:** Reserved
0	0b RO	**SPI Cycle In Progress (SCIP):** Hardware sets this bit when software sets the SPI Cycle Go bit in the Command register. This bit remains set until the cycle completes on the SPI interface. Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 1'b0.

31.5.33 PREOP (Prefix_Opcode_Configuration_bios)—Offset 94h

Prefix opcode configuration. This register is not writable when the SPI Configuration Lock-Down bit is set or when the PREOPLOCKDN bit is set.

Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

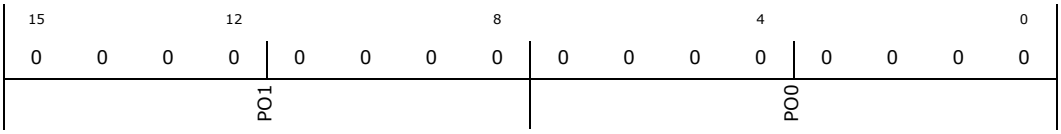
Prefix_Opcode_Configuration_bios: [SPI_BASE_ADDRESS] + 94h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 0000h



Bit Range	Default & Access	Description
15:8	00h RW/L	**Prefix Opcode 1 (PO1):** Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.
7:0	00h RW/L	**Prefix Opcode 0 (PO0):** Prefix Opcode 0: Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.

31.5.34 OPTYPE (Opcode_Type_Configuration_bios)—Offset 96h

Opcode type configuration. This register is not writable when the Flash Configuration Lock-Down bit is set or when the OPTYPELOCKDN bit is set. Entries in this register correspond to the entries in the Opcode Menu Configuration register. Note that the definition below only provides write protection for opcodes that have addresses associated with them. Therefore, any erase or write opcodes that do not use an address should be avoided (for example, Chip Erase and Auto-Address Increment Byte Program).

Access Method

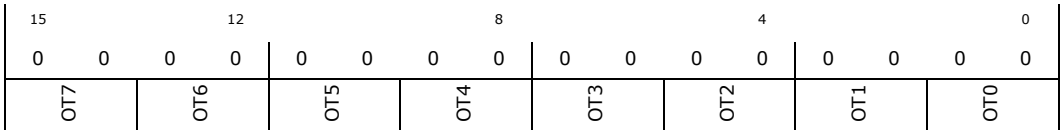
Type: Memory Mapped I/O Register (Size: 16 bits)

Opcode_Type_Configuration_bios: [SPI_BASE_ADDRESS] + 96h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 0000h



Bit Range	Default & Access	Description
15:14	00b RW/L	**Opcode Type 7 (OT7):** See the description for bits 1:0
13:12	00b RW/L	**Opcode Type 6 (OT6):** See the description for bits 1:0
11:10	00b RW/L	**Opcode Type 5 (OT5):** See the description for bits 1:0
9:8	00b RW/L	**Opcode Type 4 (OT4):** See the description for bits 1:0
7:6	00b RW/L	**Opcode Type 3 (OT3):** See the description for bits 1:0
5:4	00b RW/L	**Opcode Type 2 (OT2):** See the description for bits 1:0
3:2	00b RW/L	**Opcode Type 1 (OT1):** See the description for bits 1:0
1:0	00b RW/L	**Opcode Type 0 (OT0):** This field specifies information about the corresponding Opcode 0. This information allows the hardware to 1) know whether to use the address field and 2) provide BIOS and Shared Flash protection capabilities. The hardware implementation also uses the read vs. write information for modifying the behavior of the SPI interface logic. The encoding of the two bits is: 00 = No Address associated with this Opcode and Read Cycle type 01 = No Address associated with this Opcode and Write Cycle type 10 = Address required, Read cycle type 11 = Address required, Write cycle type

31.5.35 OPMENU0 (Opcode_Menu_Configuration_0_bios)—Offset 98h

Opcode (0-3) Menu Configuration. This register is not writable when the SPI Configuration Lock-Down bit is set or when OPMENULOCKDN bit is set. Four entries are available in this register and four are available in OPMENU1 register to give BIOS a sufficient set of commands for communicating with the flash device, while also restricting what malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices. It is recommended that BIOS avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. This could cause functional failures in a shared flash environment. Write Enable opcodes should only be programmed in the Prefix Opcodes.

Access Method

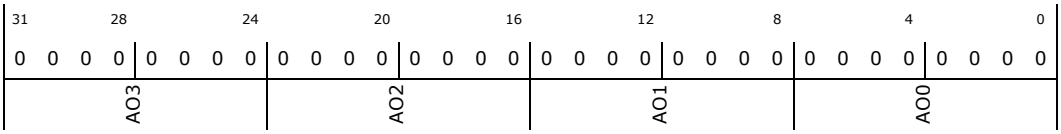
Type: Memory Mapped I/O Register (Size: 32 bits)

Opcode_Menu_Configuration_0_bios: [SPI_BASE_ADDRESS] + 98h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:24	00h RW/L	**Allowable Opcode 3 (AO3):** See the description for bits 7:0
23:16	00h RW/L	**Allowable Opcode 2 (AO2):** See the description for bits 7:0
15:8	00h RW/L	**Allowable Opcode 1 (AO1):** See the description for bits 7:0
7:0	00h RW/L	**Allowable Opcode 0 (AO0):** Software programs an SPI opcode into this field for use when initiating SPI commands through the Control Register.

31.5.36 OPMENU1 (Opcode_Menu_Configuration_1_bios)—Offset 9Ch

Opcode (7-4) Menu Configuration. This register is not writable when the SPI Configuration Lock-Down bit is set or when OPMENULOCKDN bit is set. Four entries are available in this register and four are available in OPMENU0 register to give BIOS a sufficient set of commands for communicating with the flash device, while also restricting what malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices. It is recommended that BIOS avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. This could cause functional failures in a shared flash environment. Write Enable opcodes should only be programmed in the Prefix Opcodes.

Access Method

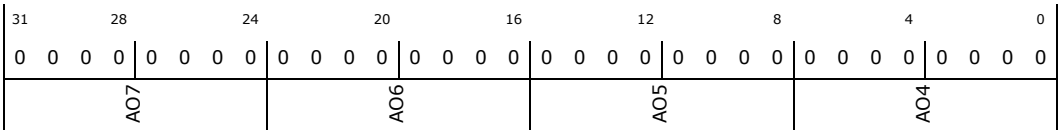
Type: Memory Mapped I/O Register (Size: 32 bits)

Opcode_Menu_Configuration_1_bios: [SPI_BASE_ADDRESS] + 9Ch

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:24	00h RW/L	**Allowable Opcode 7 (AO7):** See the description for bits 7:0 in OPMENU0
23:16	00h RW/L	**Allowable Opcode 6 (AO6):** See the description for bits 7:0 in OPMENU0
15:8	00h RW/L	**Allowable Opcode 5 (AO5):** See the description for bits 7:0 in OPMENU0
7:0	00h RW/L	**Allowable Opcode 4 (AO4):** See the description for bits 7:0 in OPMENU0

31.5.37 LOCK (Individual_Lock_Register)—Offset A4h

Used to individually lock each one of the registers formaly locked only by FLOCKDN bit. This register doesn't exclude FLOCKDN. It adds an individual option to lock each register in above to FLOCKDN.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

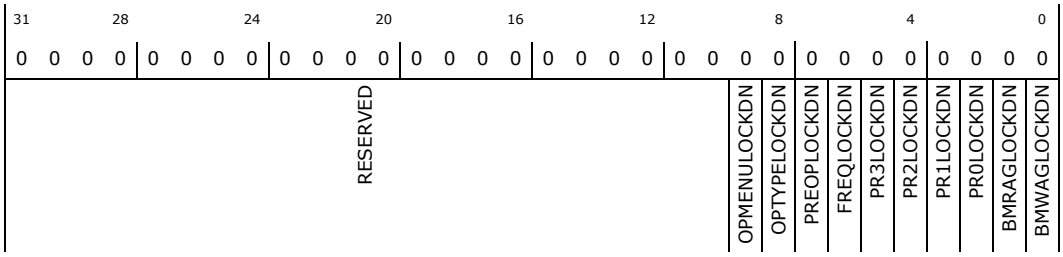
Individual_Lock_Register: [SPI_BASE_ADDRESS] + A4h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:10	0000000000000000000000b RO	**RESERVED:** reserved, should be with default 0
9	0b RW/L	**OPMENU Lock-Down (OPMENULOCKDN):** When set to 1, OPMENU0 and OPMENU1 registers cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
8	0b RW/L	**OPTYPE Lock-Down (OPTYPELOCKDN):** When set to 1, OPTYPE register cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
7	0b RW/L	**PREOP Lock-Down (PREOPLOCKDN):** When set to 1, PREOP register cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
6	0b RW/L	**SCF Lock-Down (FREQLOCKDN):** When set to 1, SCF field cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.

Bit Range	Default & Access	Description
5	0b RW/L	**PR3 Lock-Down (PR3LOCKDN):** When set to 1, PR3 register cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
4	0b RW/L	**PR2 Lock-Down (PR2LOCKDN):** When set to 1, PR2 register cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
3	0b RW/L	**PR1 Lock-Down (PR1LOCKDN):** When set to 1, PR1 register cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
2	0b RW/L	**PR0 Lock-Down (PR0LOCKDN):** When set to 1, PR0 register cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
1	0b RW/L	**BMRAG Lock-Down (BMRAGLOCKDN):** When set to 1, BMRAG field cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
0	0b RW/L	**BMWAG Lock-Down (BMWAGLOCKDN):** When set to 1, BMWAG field cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.

31.5.38 FDOC (Flash_Descriptor_Observability_Control_bios)—Offset B0h

Flash Descriptor Observability Control. This is a test mode only register that can be used to observe the contents of the Flash Descriptor that is stored internally in the SPI Controller.

Access Method

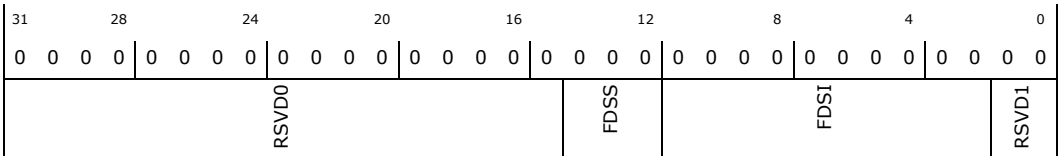
Type: Memory Mapped I/O Register (Size: 32 bits)

Flash_Descriptor_Observability_Control_bios: [SPI_BASE_ADDRESS] + B0h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000000h



Bit Range	Default & Access	Description
31:15	0b RO	**RSVD0:** Reserved
14:12	000b RW	**Flash Descriptor Section Select (FDSS):** Selects which section within the loaded Flash Descriptor to observe. 000 : Flash Signature and Descriptor Map 001 : Component 010 : Region 011 : Master 100 : Soft Straps 111 : Reserved
11:2	000h RW	**Flash Descriptor Section Index (FDSI):** Selects the DW offset within the Flash Descriptor Section to observe.
1:0	0b RO	**RSVD1:** Reserved

31.5.39 FDOD (Flash_Descriptor_Observability_Data_bios)—Offset B4h

Flash descriptor observability data

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

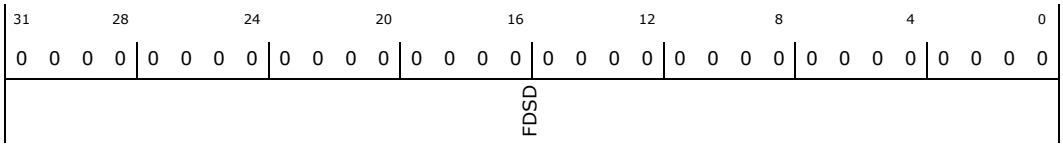
Flash_Descriptor_Observability_Data_bios: [SPI_BASE_ADDRESS] + B4h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**Flash Descriptor Section Data (FDSD):** Contains the DW of data to observe as selected in the Flash Descriptor Observability Control. at default the FDSS==3'b000 hence this register contans the data of Flash Signature and Descriptor Map.

31.5.40 AFC (Additional_Flash_Control_bios)—Offset C0h

Additional flash control

Access Method

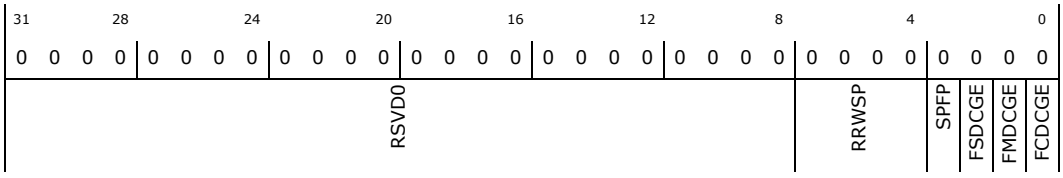
Type: Memory Mapped I/O Register (Size: 32 bits)

Additional_Flash_Control_bios: [SPI_BASE_ADDRESS] + C0h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	0b RO	**RSVD0:** Reserved
7:4	0000b RW	**Reserved RW Scratch Pad (RRWSP):** Scratch Pad bits that are R/W to be used during ECO
3	0b RW	**Stop Prefetch on Flush Pending (SPFP):** When set to 1'b1, the in progress of a prefetch will be ended if subsequence access from the same master is detected to be a cache-miss and read cache will be flushed. When set to 1'b0, the prefetch will be allowed to complete prior to flushing.

Bit Range	Default & Access	Description
2	0b RW	**Flash IOSF PRI Dynamic Clock Gating Enable (FSDCGE):** When set to 1'b1, the SPI controller IOSF-PRI interface logic can be dynamically clock gated. This register is only clear on a reset.
1	0b RW	**Flash IOSF SB Dynamic Clock Gating Enable (FMDCGE):** When set to 1'b1, the SPI controller IOSF-SB interface logic can be dynamically clock gated. This register is only clear on a reset.
0	0b RW	**Flash Core Dynamic Clock Gating Enable (FCDCGE):** When set to 1'b1, the SPI controller core logic can be dynamically clock gated. This register is only clear on a reset.

31.5.41 LVSCC (Lower_Vendor_Specific_Component_Capabilities_bios)—Offset C4h

Lower vendor specific component capabilities

Access Method

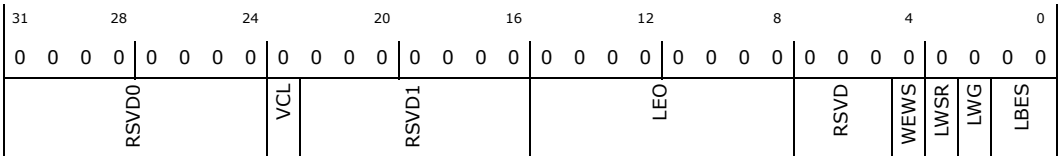
Type: Memory Mapped I/O Register (Size: 32 bits)

Lower_Vendor_Specific_Component_Capabilities_bios: [SPI_BASE_ADDRESS] + C4h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0b RO	**RSVD0:** Reserved
23	0b RW/L	**Vendor Component Lock (VCL):** '0': The lock bit is not set '1': The Vendor Component Lock bit is set. This register locks itself when set. If this register is not set and the Flash is operating in Flash Mode (as opposed to EEPROM mode), then software cannot use hardware sequencing. This requirement is not enforced by hardware, but is a requirement of the the power-on usage model.
22:16	0b RO	**RSVD1:** Reserved
15:8	00h RW/L	**Lower Erase Opcode (LEO):** This register is programed with the Flash erase instruction opcode required by this vendors Flash component. This register is locked by the Vendor Component Lock (VCL) bit. This field is used for cycles targeting addresses below the Flash Partition Address.
7:5	000b RW/L	**Reserved RW/L Scratch Pad (RSVD):** Keep RW/L for future Flash Component Specific capabilities. This register is locked by the Vendor Component Lock (VCL) bit.
4	0b RW/L	**Write Enable on Write Status (WEWS):** '0' : No Write Enable command is required to write to the Write Status register '1' : Write Enable command is required to write to the Write Status register Must be set to 1'b1 for Intel's Blanshard Flash Component and for Atmel

Bit Range	Default & Access	Description
3	0b RW/L	**Lower Write Status Required (LWSR):** '0' : No requirement to to write to the Write Status Register prior to a write '1' : A write is required to the Write Status Register prior to write and erase to remove any protection. This is required for SST components. This register is locked by the Vendor Component Lock (VCL) bit. This field is used for cycles targeting addresses below the Flash Partition Address.
2	0b RW/L	**Lower Write Granularity (LWG):** '0' : 1 Byte '1' : 64 Byte This register is locked by the Vendor Component Lock (VCL) bit. This field is used for cycles targeting addresses below the Flash Partition Address.
1:0	00b RW/L	**Lower Block/Sector Erase Size (LBES):** This field identifies the erasable sector size for all Flash components. Valid Bit Settings: '00' : 256 Byte '01' : 4K Byte '10' : 8K Byte '11' : 64K Byte This register is locked by the Vendor Component Lock (VCL) bit. Hardware takes no action based on the value of this register. The contents of this register are to be used only by software and can be read in the HSFSTS.BERASE register in both the BIOS and the GbE program registers. This field is used for cycles targeting addresses below the Flash Partition Address.

31.5.42 UVSCC (Upper_Vendor_Specific_Component_Capabilities_bios)—Offset C8h

Upper vendor specific component capabilities

Access Method

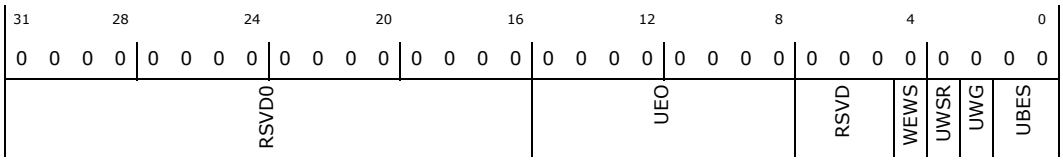
Type: Memory Mapped I/O Register (Size: 32 bits)

Upper_Vendor_Specific_Component_Capabilities_bios: [SPI_BASE_ADDRESS] + C8h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:8	00h RW/L	**Upper Erase Opcode (UEO):** This register is programed with the Flash erase instruction opcode required by this vendors Flash component. This register is locked by the Vendor Component Lock (VCL) bit. This field is used for cycles targeting addresses above the Flash Partition Address.
7:5	0h RW/L	**Reserved RW/L Scratch Pad (RSVD):** Keep RW/L for future Flash Component Specific capabilities. This register is locked by the Vendor Component Lock (VCL) bit.
4	0b RW/L	**Write Enable on Write Status (WEWS):** '0' : No Write Enable command is required to write to the Write Status register '1' : Write Enable command is required to write to the Write Status register Must be set to 1'b1 for Intel's Blanshard Flash Component and for Atmel

Bit Range	Default & Access	Description
3	0b RW/L	**Upper Write Status Required (UWSR):** '0': No requirement to to write to the Write Status Register prior to a write '1': A write is required to the Write Status Register prior to write and erase to remove any protection. This is required for SST components. This register is locked by the Vendor Component Lock (VCL) bit. This field is used for cycles targeting addresses above the Flash Partition Address.
2	0b RW/L	**Upper Write Granularity (UWG):** '0' : 1 Byte '1' : 64 Byte This register is locked by the Vendor Component Lock (VCL) bit. This field is used for cycles targeting addresses above the Flash Partition Address.
1:0	00b RW/L	**Upper Block/Sector Erase Size (UBES):** This field identifies the erasable sector size for all Flash components. Valid Bit Settings: '00' : 256 Byte '01' : 4K Byte '10' : 8K Byte '11' : 64K Byte Note: If supporting more than one Flash component, all flash components must have identical Block/ Sector erase sizes. This register is locked by the Vendor Component Lock (VCL) bit. Hardware takes no action based on the value of this register. The contents of this register are to be used only by software and can be read in the HSFSTS.BERASE register in both the BIOS and the GBE program registers. This field is used for cycles targeting addresses above the Flash Partition Address.

31.5.43 FPB (Flash_Partition_Boundary_bios)—Offset D0h

Flash partition boundary

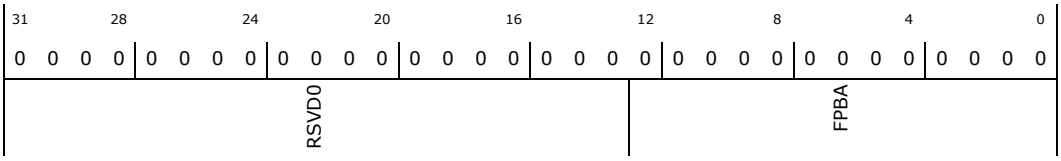
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Flash_Partition_Boundary_bios: [SPI_BASE_ADDRESS] + D0h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000000h



Bit Range	Default & Access	Description
31:13	0b RO	**RSVD0:** Reserved
12:0	0000h RO/U	**Flash Partition Boundary Address (FPBA):** This register reflects the value of the Flash Descriptor Component FPBA field

31.5.44 SCS (SMI_Control_Status_Register_bios)—Offset F8h

SMI Control and Status

Access Method

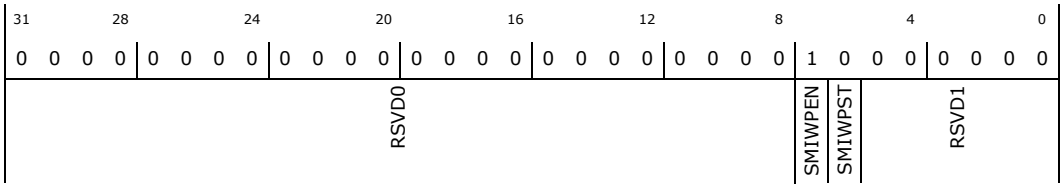
Type: Memory Mapped I/O Register (Size: 32 bits)

SMI_Control_Status_Register_bios: [SPI_BASE_ADDRESS] + F8h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000080h



Bit Range	Default & Access	Description
31:8	0b RO	**RSVD0:** Reserved
7	1b RW	**SMI WPD Enable (SMIWPEN):** When this bit is set to a 1'b1, it enables the SPI controller to generate SMI upon not SMM code is trying to set WPD from a 1'b0 to a 1'b1 while LE is set.
6	0b RW/1C	**SMI WPD Status (SMIWPST):** Set when SMI is generated upon trying to set WPD from a 1'b0 to a 1'b1 by not SMM code (while LE and SMIWPEN are set). Write a 1'b1 to this bit should clear it and clear the SMI (send DEASSERT_SMI)
5:0	0b RO	**RSVD1:** Reserved

31.5.45 BCR (BIOS_Control_Register_bios)—Offset FCh

BIOS control register. This register formerly was in the 0:31:0 config space

Access Method

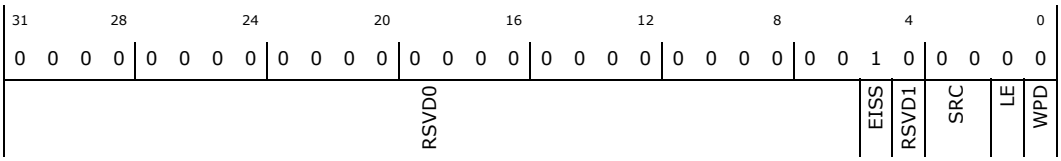
Type: Memory Mapped I/O Register (Size: 32 bits)

BIOS_Control_Register_bios: [SPI_BASE_ADDRESS] + FCh

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000020h



Bit Range	Default & Access	Description
31:6	0b RO	**RSVD0:** Reserved
5	1b RW/L	**Enable InSMM_STS (EISS):** When this bit is set, the BIOS region is writable only to SMM code. Today BIOS Flash is writable if WPD is a '1'. If this bit [lb]5[rb] is set, then WPD must be a 1'b1 and iosfep_xxx_hprot[lb]1[rb] signal be 1'b1 also. If this bit [lb]5[rb] is clear, then BIOS is writable based only on WPD = 1'b1 and the iosfep_xxx_hprot[lb]1[rb] signal is a don't care.
4	0b RO	**RSVD1:** Reserved
3:2	00b RW	**SPI Read Configuration (SRC):** This 2-bit field controls two policies related to BIOS reads on the SPI interface: Bit 3 - Prefetch Enable, Bit 2 - Cache Disable. Settings are summarized below: '00' : No prefetching, but caching enabled. Direct Memory reads load the read buffer cache with 'valid' data, allowing repeated reads to the same range to complete quickly. '01' : No prefetching and no caching. One-to-one correspondence of host BIOS reads to SPI cycles. This value can be used to invalidate the cache. '10' : Prefetching and Caching enabled. This mode is used for long sequences of short reads to consecutive addresses (i.e. shadowing) '11' : Illegal. Caching must be enabled when Prefetching is enabled. This eliminates the need for a complex prefetch-flushing mechanism. Note that if BIOS direct read caching is disabled while data has already been cached internally, subsequent BIOS direct reads will continue to return data from the cache until the cache is invalidated.
1	0b RW/L	**Lock Enable (LE):** When set, WPD bit could be set from a 1'b0 to a 1'b1 only by SMM code. When cleared, setting the WP bit is allowed in all modes and SMI is not generated. Once set, this bit can only be cleared by a PLTRST#. When this bit is set, EISS - bit [lb]5[rb] of this register is locked down.
0	0b RW	**Write Protect Disable (WPD):** When set, access to the BIOS space is enabled for both read and write cycles. When cleared, only read cycles are permitted to the flash. When LE bit is set this bit could be written from a 1'b0 to a 1'b1 only by SMM code. When not SMM code tries to writes this bit from a 1'b0 to a 1'b1, bit remain in its 1'b0 value. An Async-SMI is generated (Send ASSERT_SMI) if SMIWPEN is set. This ensures that only SMM code can update BIOS.

31.5.46 TCGC (Trunk_Clock_Gating_Control_bios)—Offset 100h

Trunk_Clock_Gating_Control

Access Method

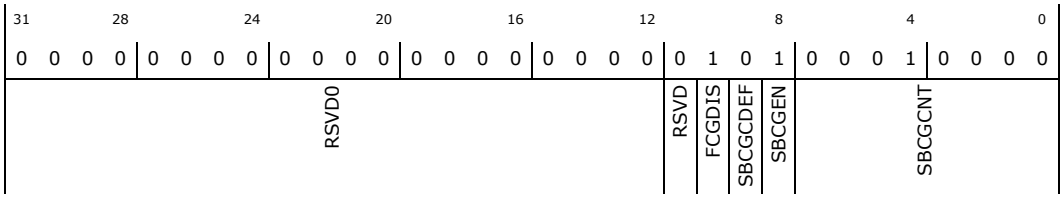
Type: Memory Mapped I/O Register (Size: 32 bits)

Trunk_Clock_Gating_Control_bios: [SPI_BASE_ADDRESS] + 100h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000510h

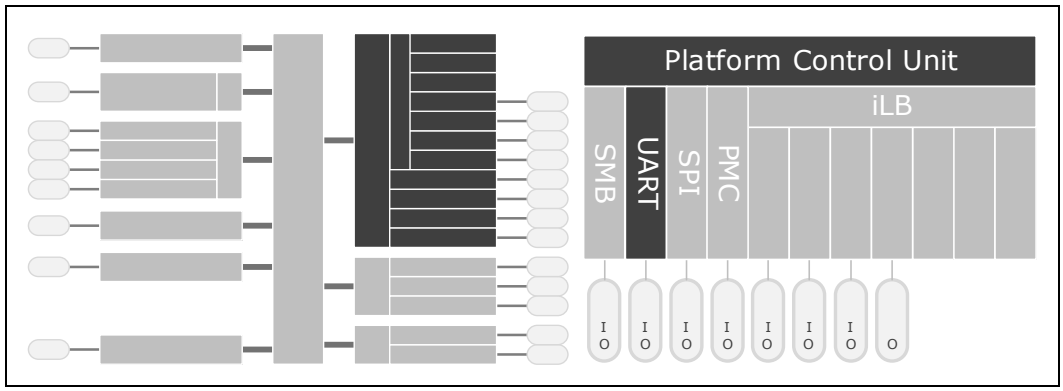


Bit Range	Default & Access	Description
31:12	0b RO	**RSVD0:** Reserved
11	0b RO	**Reserved (RSVD):** Reserved.
10	1b RW	**FCGDIS:** Functional clock gating disable, chicken bit for the func_clk_gating FSM
9	0b RW	**SBCGCDEF:** SideBanb Control Gating Clock Defeature .Clock gate defeature bit which allows the ISM to transition to idle, but prevents the final clock masking from occurring. The value of this bit goes to the 'cgctrl_clkgatedef' port of the SideBand EndPoint
8	1b RW	**SBCGEN:** SideBanb Control Gating Clock Enable. Clock gate enable which prevents ISM from leaving ACTIVE. Also prevents the clocks from being gated. The value of this bit goes to the 'cgctrl_clkgaten' port of the SideBand EndPoint
7:0	10h RW	**SBCGCNT:** SideBanb Control Gating Clock Counter. Idle count limit for ISM which is used to determine the block is idle.Recommended value 8'd16 . The value of those bits goes to the 'cgctrl_idlecnt' ports of the SideBand EndPoint

32 PCU – Universal Asynchronous Receiver/Transmitter (UART)

This section describes the Universal Asynchronous Receiver/Transmitter (UART) serial port integrated into the PCU. The UART may be controlled through programmed IO.

Note: Only a minimal ball-count, comprising receive & transmit signals, UART port is implemented. Further, a maximum baud rate of only 115,200 bps is supported. For this reason, it is recommended that the UART port be used for debug purposes only.



32.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

Table 306. UART Signals

Signal Name	Direction Plat. Power	Description
PCU_UART_RXD	I V1P8S	**COM1 Receive:** Serial data input from device pin to the receive port. *This signal is muxed and may be used by other functions.*
PCU_UART_TXD	O V1P8S	**COM1 Transmit:** Serial data output from transmit port to the device pin. *This signal is muxed and may be used by other functions.*

32.2 Features

The serial port consists of a UART which supports a subset of the functions of the 16550 industry standard.

The UART performs serial-to-parallel conversion on data characters received from a peripheral device and parallel-to-serial conversion on data characters received from the processor. The processor may read the complete status of the UART at any time during the functional operation. Available status information includes the type and condition of the transfer operations being performed by the UART and any error conditions.

The serial port may operate in either FIFO or non-FIFO mode. In FIFO mode, a 16-byte transmit FIFO holds data from the processor to be transmitted on the serial link and a 16-byte Receive FIFO buffers data from the serial link until read by the processor.

The UART includes a programmable baud rate generator which is capable of generating a baud rate of between 50 bps and 115,200 bps from a fixed baud clock input of 1.8432 MHz. The baud rate is calculated as follows:

Baud Rate Calculation:

$$\text{BaudRate} = \frac{1.8432 \times 10^6}{16 \times \text{Divisor}}$$

The divisor is defined by the Divisor Latch LSB and Divisor Latch MSB registers. Some common values are shown in Table 307.

Table 307. Baud Rate Examples

Desired Baud Rate	Divisor	Divisor Latch LSB Register	Divisor Latch MSB Register
115,200	1	1h	0h
57,600	2	2h	0h
38,400	3	3h	0h
19,200	6	6h	0h
9,600	12	Ch	0h
4,800	24	18h	0h
2,400	48	30h	0h
1,200	96	60h	0h
300	384	80h	1h
50	2,304	0h	9h

The UART has interrupt support and those interrupts may be programmed to the user's requirements, minimizing the computing required to handle the communications link. Each UART may operate in a polled or an interrupt driven environment as configured by software.

32.2.1 FIFO Operation

32.2.1.1 FIFO Interrupt Mode Operation

Receiver Interrupt

When the Receive FIFO and receiver interrupts are enabled (FIFO Control Register, bit 0 = 1b and Interrupt Enable Register (IIR), bit 0 = 1b), receiver interrupts occur as follows:

- The receive data available interrupt is invoked when the FIFO has reached its programmed trigger level. The interrupt is cleared when the FIFO drops below the programmed trigger level.
- The IIR receive data available indication also occurs when the FIFO trigger level is reached, and like the interrupt, the bits are cleared when the FIFO drops below the trigger level.
- The receiver line status interrupt (IIR = C6h), as before, has the highest priority. The receiver data available interrupt (IIR = C4h) is lower. The line status interrupt occurs only when the character at the top of the FIFO has errors.
- The COM1_LSR.DR bit is set to 1b as soon as a character is transferred from the shift register to the Receive FIFO. This bit is reset to 0b when the FIFO is empty.

Character Time Out Interrupt

When the receiver FIFO and receiver time out interrupt are enabled, a character time out interrupt occurs when all of the following conditions exist:

- At least one character is in the FIFO.
- The last received character was longer than four continuous character times ago (if 2 stop bits are programmed the second one is included in this time delay).
- The most recent processor read of the FIFO was longer than four continuous character times ago.
- The receiver FIFO trigger level is greater than one.

The maximum time between a received character and a timeout interrupt is 160 ms at 300 baud with a 12-bit receive character (i.e., 1 start, 8 data, 1 parity, and 2 stop bits).

When a time out interrupt occurs, it is cleared and the timer is reset when the processor reads one character from the receiver FIFO. If a time out interrupt has not occurred, the time out timer is reset after a new character is received or after the processor reads the receiver FIFO.

Transmit Interrupt

When the transmitter FIFO and transmitter interrupt are enabled (FIFO Control Register, bit 0 = 1b and Interrupt Enable Register, bit 0 = 1b), transmit interrupts occur as follows:

The Transmit Data Request interrupt occurs when the transmit FIFO is half empty or more than half empty. The interrupt is cleared as soon as the Transmit Holding Register is written (1 to 16 characters may be written to the transmit FIFO while servicing the interrupt) or the Interrupt Identification Register is read.

32.2.1.2 FIFO Polled Mode Operation

With the FIFOs enabled (FIFO Control register, bit 0 = 1b), setting Interrupt Enable register (IER), bits 3:0 = 000b puts the serial port in the FIFO polled mode of operation. Since the receiver and the transmitter are controlled separately, either one or both may be in the polled mode of operation. In this mode, software checks receiver and transmitter status through the Line Status Register (LSR). As stated in the register description:

- LSR[0] is set as long as there is one byte in the receiver FIFO.
- LSR[1] through LSR[4] specify which error(s) has occurred for the character at the top of the FIFO. Character error status is handled the same way as interrupt mode. The Interrupt Identification Register is not affected since IER[2] = 0b.
- LSR[5] indicates when the transmitter FIFO needs data.
- LSR[6] indicates that both the transmitter FIFO and shift register are empty.
- LSR[7] indicates whether there are any errors in the receiver FIFO.

32.3 Use

32.3.1 Base I/O Address

32.3.1.1 COM1

The base I/O address for the COM1 UART is fixed to 3F8h.

32.3.2 Legacy Interrupt

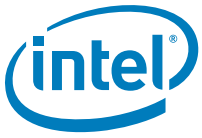
32.3.2.1 COM1

The legacy interrupt assigned to the COM1 UART is fixed to IRQ4.

32.4 UART Enable/Disable

The COM1 UART may be enabled or disabled using the UART_CONT.COM1EN register bit. By default, the UART is disabled.

Note: It is recommended that the UART be disabled during normal platform operation since it is a PIO device and, as such, can prevent residency in lower power states by the processor.



32.5 IO Mapped Registers

There are 12 registers associated with the UART. These registers share eight address locations in the IO address space. Table 308 shows the registers and their addresses as offsets of a base address. Note that the state of the COM1_LCR.DLAB register bit, which is the most significant bit (MSB) of the Serial Line Control register, affects the selection of certain of the UART registers. The COM1_LCR.DLAB register bit must be set high by the system software to access the Baud Rate Generator Divisor Latches.

Table 308. Register Access List

Register Address (Offset to Base IO Address)	COM1_LCR.DLAB Value	Register Access Type	Register Accessed
0h	0b	RO	Receiver Buffer[1]
0h	0b	WO	Transmitter Holding[1]
0h	1b	RW	Divisor Latch LSB (Lowest Significant Bit)[1]
1h	0b	RW	Interrupt Enable[2]
1h	1b	RW	Divisor Latch MSB (Most Significant Bit)[2]
2h	xb	RO	Interrupt Identification[3]
2h	xb	WO	FIFO Control[3]
3h	xb	RW	Line Control
4h	xb	RW	Modem Control[4]
5h	xb	RO	Line Status
6h	xb	RO	Modem Status[4]
7h	xb	RW	Scratchpad

Notes:
1. These registers are consolidated in the Receiver Buffer / Transmitter Holding Register (COM1_RX_TX_BUFFER)
2. These registers are consolidated in the Interrupt Enable Register (COM1_IER)
3. These registers are consolidated in the Interrupt Identification / FIFO Control Register (COM1_IIR)
4. These registers are implemented but unused since the UART signals related to modem interaction are not implemented.

§

32.6 PCU iLB UART IO Registers

Table 309. Summary of PCU iLB UART I/O Registers—

Offset	Size	Register ID—Description	Default Value
3F8h	1	"Receiver Buffer / Transmitter Holding Register (COM1_Rx_Tx_Buffer)—Offset 3F8h" on page 4432	00h
3F9h	1	"Interrupt Enable Register (COM1_IER)—Offset 3F9h" on page 4433	00h
3FAh	1	"Interrupt Identification / FIFO Control Register (COM1_IIR)—Offset 3FAh" on page 4434	01h
3FBh	1	"Line Control Register (COM1_LCR)—Offset 3FBh" on page 4435	00h
3FCh	1	"Modem Control Register (COM1_MCR)—Offset 3FCh" on page 4436	00h
3FDh	1	"Line Status Register (COM1_LSR)—Offset 3FDh" on page 4437	60h
3FEh	1	"Modem Status Register (COM1_MSR)—Offset 3FEh" on page 4438	00h
3FFh	1	"Scratchpad Register (COM1_SCR)—Offset 3FFh" on page 4440	00h

32.6.1 Receiver Buffer / Transmitter Holding Register (COM1_Rx_Tx_Buffer)—Offset 3F8h

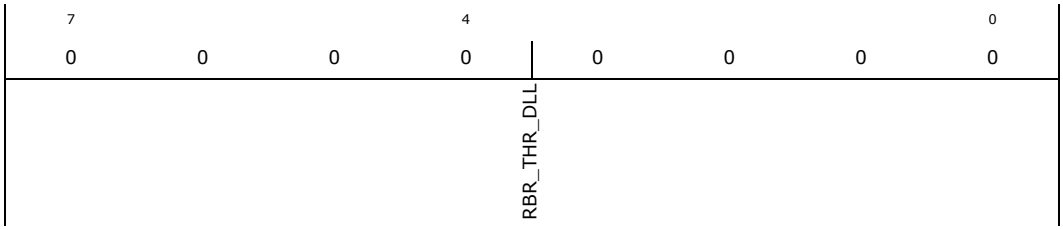
This register is a combination of three registers: the receiver buffer register (RBR) that is a read-only register when DLAB=0, the transmitter holding register (THR) that is a write-only register when DLAB=0 and the divisor latch LSB (DLL) register when DLAB=1.

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_Rx_Tx_Buffer: 3F8h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Receiver buffer / transmitter holding (RBR_THR_DLL): When reading from this register and DLAB=1'b0**, it contains the byte received if no FIFO is used, or the oldest unread byte with FIFO's. If FIFO buffering is used, each new read action of the register will return the next byte, until no more bytes are present. Bit 0 in the LSR line status register can be used to check if all received bytes have been read. This bit wil change to zero if no more bytes are present. **When writing to this register and DLAB=1'b0**, it is used to buffer outgoing characters. If no FIFO buffering is used, only one character can be stored. Otherwise the amount of characters depends on the type of UART. Bit 5 in the LSR, line status register can be used to check if new information must be written to this register. The value 1'b1 indicates that the register is empty. If FIFO buffering is used, more than one character can be written to the transmitter holding register when the bit signals an empty state. There is no indication of the amount of bytes currently present in the transmitter FIFO. This register is not used to transfer the data directly. The byte is first transferred to a shift register where the information is broken in single bits which are sent one by one. **If DLAB=1'b1**, this register is used as DLL (Divisor Latch LSB). For generating its timing information, each UART uses an oscillator generating a frequency of about 1.8432 MHz. This frequency is divided by 16 to generate the time base for communucation. Because of this division, the maximum allowed communication speed is 115200 bps. Modern UARTS like the 16550 are capable of handling higher input frequencies up to 24 MHz which makes it possible to communicate with a maximum speed of 1.5 Mbps. On PC's higher frequencies than the 1.8432 MHz are rarely seen because this would be software incompatible with the original XT configuration. This 115200 bps communication speed is not suitable for all applications. To change the communication speed, the frequency can be further decreased by dividing it by a programmable value. For very slow communications, this value can go beyond 255. Therefore, the divisor is stored in two seperate bytes, the divisor latch registers DLL and DLM which contain the least, and most significant byte. For error free communication, it is necessary that both the transmitting and receiving UART use the same time base. Default values have been defined which are commonly used. The table shows the most common values with the appropriate settings of the divisor latch bytes. Note that these values only hold for a PC compatible system where a clock frequency of 1.8432 MHz is used. Speed(bps) Divisor DLL DLM 50 2,304 0x00 0x09 300 384 0x80 0x01 1,200 96 0x60 0x00 2,400 48 0x30 0x00 4,800 24 0x18 0x00 9,600 12 0x0C 0x00 19,200 6 0x06 0x00 38,400 3 0x03 0x00 57,600 2 0x02 0x00 115,200 1 0x01 0x00

32.6.2 Interrupt Enable Register (COM1_IER)—Offset 3F9h

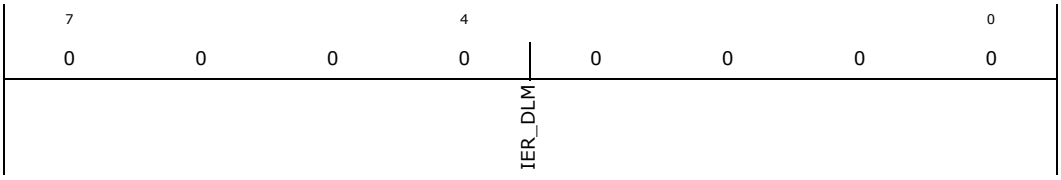
This register is a combination of two registers: the interrupt enable register (IER) when DLAB=0 and the divisor latch MSB (DLM) register when DLAB=1.

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_IER: 3F9h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Interrupt Enable (IER_DLM): If DLAB=1'b0**, This field is used as interrupt enable register. The smartest way to perform serial communications on a PC is using interrupt driven routines. In that configuration, it is not necessary to poll the registers of the UART periodically for state changes. The UART will signal each change by generating a processor interrupt. A software routine must be present to handle the interrupt and to check what state change was responsible for it. Interrupts are not generated, unless the UART is told to do so. This is done by setting bits in the IER, interrupt enable register. A bit value 1 indicates, that an interrupt may take place. Bit Description 0 ERBFI - Enable Received Data Available Interrupt. This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFOs enabled). These are the second highest priority interrupts. 1 ETBEI - Enable Transmit Holding Register Empty Interrupt. This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third highest priority interrupt. 2 ELSI - Enable Receiver Line Status Interrupt. This is used to enable/disable the generation of Receiver Line Status Interrupt. This is the highest priority interrupt. 3 EDSSI - Enable Modem Status Interrupt. This is used to enable/ disable the generation of Modem Status Interrupt. This is the fourth highest priority interrupt. 4 Reserved and read as zero 5 Reserved and read as zero 6 Reserved and read as zero 7 PTIME - Programmable THRE Interrupt Mode Enable that can be written to only when THRE_MODE_USER == Enabled, always readable. This is used to enable/disable the generation of THRE Interrupt. **If DLAB=1'b1**, this register is used as DLM (Divisor Latch MSB). See DLL field description in the Rx_Tx_Buffer register.

32.6.3 Interrupt Identification / FIFO Control Register (COM1_IIR)—Offset 3FAh

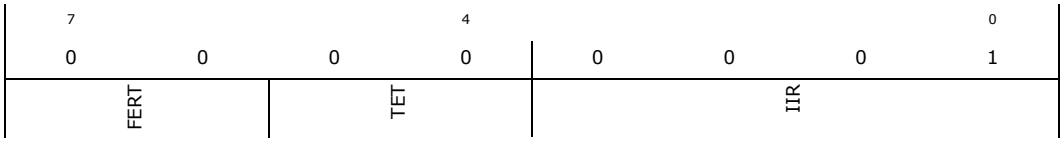
This register is a combination of two registers: the interrupt identification register (IIR) that is a read-only register and the FIFO control register (FCR) that is a write-only register. If FIFOs are not implemented, the FIFO control register does not exist and writing to this register address has no effect.

Access Method

Type: I/O Register (Size: 8 bits)

COM1_IIR: 3FAh

Default: 01h



Bit Range	Default & Access	Description
7:6	00b RO	**FIFOs Enabled / RCVR Trigger (FERT): Read** from this field is used to indicate whether the FIFOs are enabled or disabled. '00' - disabled '11' - enabled **Write** to this field is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt is generated. In auto flow control mode it is used to determine when the rts_n signal is de-asserted. The following trigger levels are supported: '00' - 1 character in the FIFO '01' - FIFO 1/4 full '10' - FIFO 1/2 full '11' - FIFO 2 less than full
5:4	00b RO	**TX Empty Trigger (TET): Read** from this field is reserved and should return zero **Write** to this field is used to select the empty threshold level at which the THRE Interrupts are generated when the mode is active. The following trigger levels are supported: '00' - FIFO empty '01' - 2 characters in the FIFO '10' - FIFO 1/4 full '11' - FIFO 1/2 full

Bit Range	Default & Access	Description
3:0	0001b RO	**Interrupt ID (IIR): Read** from this field indicates the highest priority pending interrupt which can be one of the following types: '0000' - modem status '0001' - no interrupt pending '0010' - THR empty '0100' - received data available '0110' - receiver line status '0111' - busy detect '1100' - character timeout **Write** to this field is split to four bits: Bit Description 3 DMA Mode, determines the DMA signalling mode used: '0'- mode 0, '1' - mode 1 2 XMIT FIFO Reset, resets the control portion of the transmit FIFO and treats the FIFO as empty. 1 RCVR FIFO Reset, resets the control portion of the receive FIFO and treats the FIFO as empty. 0 FIFO Enable. This enables/disables the transmit (XMIT) and receive (RCVR) FIFOs. Whenever the value of this bit is changed both the XMIT and RCVR controller portion of FIFOs is reset.

32.6.4 Line Control Register (COM1_LCR)—Offset 3FBh

The LCR, line control register is used at initialisation to set the communication parameters. Parity and number of data bits can be changed for example. The register also controls the accessibility of the DLL and DLM registers. These registers are mapped to the same I/O port as the RBR, THR and IER registers. Because they are only accessed at initialisation when no communication occurs this register swapping has no influence on performance.

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_LCR: 3FBh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
DLAB	BC	SP	EPS	PEN	STOP	DLS	

Bit Range	Default & Access	Description
7	0b RW	**Divisor Latch Access Bit (DLAB):** This field is used to enable reading and writing of the Divisor Latch register (DLL and DLH) to set the baud rate of the UART. This bit must be cleared after initial baud rate setup in order to access other registers. '0' - RBR, THR and IER accessible '1' - DLL and DLM accessible See Rx_Tx_Buffer and IER registers description for more details.
6	0b RW	**Break Control (BC):** This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared. If SIR_MODE == Enabled and active (MCR[6] set to one) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low.
5	0b RO	**Stick Parity (SP):** Reserved and read as zero
4	0b RW	**Even Parity Select (EPS):** This is used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic 1s is transmitted or checked. If set to zero, an odd number of logic 1s is transmitted or checked.
3	0b RW	**Parity Enable (PEN):** This is used to enable and disable parity generation and detection in transmitted and received serial character respectively. '0' - parity disabled '1' - parity enabled

Bit Range	Default & Access	Description
2	0b RW	**Number ofStop bits (STOP):** This is used to select the number of stop bits per character that the peripheral transmits and receives. If set to zero, one stop bit is transmitted in the serial data. If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected, the receiver checks only the first stop bit. '0' - 1 stop bit '1' - 1.5 stop bits when DLS (LCR[1:0]) is zero, else 2 stop bit
1:0	00b RW	**Data Length Select (DLS):** This is used to select the number of data bits per character that the peripheral transmits and receives. The number of bit that may be selected areas follows: '00' - 5 bits '01' - 6 bits '10' - 7 bits '11' - 8 bits

32.6.5 Modem Control Register (COM1_MCR)—Offset 3FCh

The MCR, modem control register is used to perform handshaking actions with the attached device. In the original UART series including the 16550, setting and resetting of the control signals must be done by software. The new 16750 is capable of handling flow control automatically, thereby reducing the load on the processor.

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_MCR: 3FCh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
RSVD0	SIRE	AFCE	LB	OUT2	OUT1	RTS	DTR

Bit Range	Default & Access	Description
7	0b RO	**RSVD0:** Reserved
6	0b RW	**SIR Mode Enable (SIRE):** Writeable only when SIR_MODE == Enabled, always readable. This is used to enable/disable the IrDA SIR Mode features as described in 'IrDA 1.0 SIR Protocol' on Synopsys UART specification. '0' - IrDA SIR Mode disabled '1' - IrDA SIR Mode enabled
5	0b RW	**Auto Flow Control Enable (AFCE):** Writeable only when AFCE_MODE == Enabled, always readable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, Auto Flow Control features are enabled as described in 'Auto Flow Control' on Synopsys UART specification. '0' - Auto Flow Control Mode disabled '1' - Auto Flow Control Mode enabled
4	0b RW	**LoopBack (LB):** This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled or not active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line.
3	0b RW	**Auxiliary output 2 (OUT2):** This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n, that is: '0' - out2_n de-asserted (logic 1) '1' - out2_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input.

Bit Range	Default & Access	Description
2	0b RW	**Auxiliary output 1 (OUT1):** This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n, that is: '0' - out1_n de-asserted (logic 1) '1' - out1_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input.
1	0b RW	**Request to Send (RTS):** This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high.In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] set to one) and FIFOs enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal is de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input. Note that PCU-UART does not implement the Request to Send (rts_n) output.
0	0b RW	**Data Terminal Ready (DTR):** This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n, that is: '0' - dtr_n de-asserted (logic 1) '1' - dtr_n asserted (logic 0) The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input. Note that PCU-UART does not implement the Data Terminal Ready (dtr_n) output.

32.6.6 Line Status Register (COM1_LSR)—Offset 3FDh

The LSR, line status register shows the current state of communication. Errors are reflected in this register. The state of the receive and transmit buffers is also available.

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_LSR: 3FDh

Default: 60h

7			4				0
0	1	1	0	0	0	0	0
RFE	TEMT	THRE	BI	FE	PE	OE	DR

Bit Range	Default & Access	Description
7	0b RO	**Receiver FIFO Error (RFE):** This bit is only relevant when FIFO_MODE != NONE AND FIFOs are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. '0' - no error in RX FIFO '1' - error in RX FIFO This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO.
6	1b RO	**Transmitter Empty (TEMT):** If in FIFO mode (FIFO_MODE != NONE) and FIFOs enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in non-FIFO mode or FIFOs are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty.

Bit Range	Default & Access	Description
5	1b RO	**Transmit Holding Register Empty (THRE):** If THRE_MODE_USER == Disabled or THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/ enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE_MODE_USER == Enabled AND FIFO_MODE != NONE and both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting.
4	0b RO	**Break Interrupt (BI):** This is used to indicate the detection of a break sequence on the serial input data. If in UART mode (SIR_MODE == Disabled), it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. If in infrared mode (SIR_MODE == Enabled), it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit. In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read.
3	0b RO	**Framing Error (FE):** This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs, the UART tries to resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). '0' - no framing error '1' - framing error Reading the LSR clears the FE bit.
2	0b RO	**Parity Error (PE):** This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). '0' - no parity error '1' - parity error Reading the LSR clears the PE bit.
1	0b RO	**Overrun Error (OE):** This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. '0' - no overrun error '1' - overrun error Reading the LSR clears the OE bit.
0	0b RO	**Data Ready (DR):** This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. '0' - no data ready '1' - data ready This bit is cleared when the RBR is read in non-FIFO mode, or when the receiver FIFO is empty, in FIFO mode.

32.6.7 Modem Status Register (COM1_MSR)—Offset 3FEh

The MSR, modem status register contains information about the four incomming modem control lines on the device. The information is split in two nibbles. The four most siginificant bits contain information about the current state of the inputs where the least significant bits are used to indicate state changes. The four LSB's are reset, each time the register is read. Whenever bits 0, 1, 2 or 3 are set to logic one, to indicate a change on the modem control inputs, a modem status interrupt is generated if enabled through the IER, regardless of when the change occurred. Since the delta

bits (bits 0, 1, 3) can get set after a reset if their respective modem signals are active (see individual bits for details), a read of the MSR after reset can be performed to prevent unwanted interrupts.

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_MSR: 3FEh

Default: 00h

7				4			0
0	0	0	0	0	0	0	0
DCD	RI	DSR	CTS	DDCD	TERI	DDSR	DCTS

Bit Range	Default & Access	Description
7	0b RO	**Data Carrier Detect (DCD):** This is used to indicate the current state of the modem control line dcd_n. This bit is the complement of dcd_n. When the Data Carrier Detect input (dcd_n) is asserted it is an indication that the carrier has been detected by the modem or data set. '0' - dcd_n input is de-asserted (logic 1) '1' - dcd_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), DCD is the same as MCR[3] (Out2). Note that PCU-UART does not implement the Data Carrier Detect (dcd_n) input.
6	0b RO	**Ring Indicator (RI):** This is used to indicate the current state of the modem control line ri_n. This bit is the complement of ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by the modem or data set. '0' - ri_n input is de-asserted (logic 1) '1' - ri_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), RI is the same as MCR[2] (Out1). Note that PCU-UART does not implement the Ring Indicator (ri_n) input.
5	0b RO	**Data Set Ready (DSR):** This is used to indicate the current state of the modem control line dsr_n. This bit is the complement of dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the DW_apb_uart. '0' - dsr_n input is de-asserted (logic 1) '1' - dsr_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR). Note that PCU-UART does not implement the Data Set Ready (dsr_n) input.
4	0b RO	**Clear to Send (CTS):** This is used to indicate the current state of the modem control line cts_n. This bit is the complement of cts_n. When the Clear to Send input (cts_n) is asserted it is an indication that the modem or data set is ready to exchange data with the DW_apb_uart. '0' - cts_n input is de-asserted (logic 1) '1' - cts_n input is asserted (logic 0) In Loopback Mode (MCR[4] = 1), CTS is the same as MCR[1] (RTS). Note that PCU-UART does not implement the Clear to Send (cts_n) input.
3	0b RO	**Delta Data Carrier Detect (DDCD):** This is used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. '0' - no change on dcd_n since last read of MSR '1' - change on dcd_n since last read of MSR Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] = 1), DDCD reflects changes on MCR[3] (Out2). Note, if the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCD bit is set when the reset is removed if the dcd_n signal remains asserted. Note that PCU-UART does not implement the Data Carrier Detect (dcd_n) input.
2	0b RO	**Trailing Edge of Ring Indicator (TERI):** This is used to indicate that a change on the input ri_n (from an active-low to an inactive-high state) has occurred since the last time the MSR was read. '0' - no change on ri_n since last read of MSR '1' - change on ri_n since last read of MSR Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] = 1), TERI reflects when MCR[2] (Out1) has changed state from a high to a low. Note that PCU-UART does not implement the Ring Indicator (ri_n) input.

Bit Range	Default & Access	Description
1	0b RO	**Delta Data Set Ready (DDSR):** This is used to indicate that the modem control line dsr_n has changed since the last time the MSR was read. '0' - no change on dsr_n since last read of MSR '1' - change on dsr_n since last read of MSR Reading the MSR clears the DDSR bit. In Loopback Mode (MCR[4] = 1), DDSR reflects changes on MCR[0] (DTR). Note, if the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDSR bit is set when the reset is removed if the dsr_n signal remains asserted. Note that PCU-UART does not implement the Data Set Ready (dsr_n) input.
0	0b RO	**Delta Clear to Send (DCTS):** This is used to indicate that the modem control line cts_n has changed since the last time the MSR was read. '0' - no change on cts_n since last read of MSR '1' - change on cts_n since last read of MSR Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] = 1), DCTS reflects changes on MCR[1] (RTS). Note, if the DCTS bit is not set and the cts_n signal is asserted (low) and a reset occurs (software or otherwise), then the DCTS bit is set when the reset is removed if the cts_n signal remains asserted. Note that PCU-UART does not implement the Clear to Send (cts_n) input.

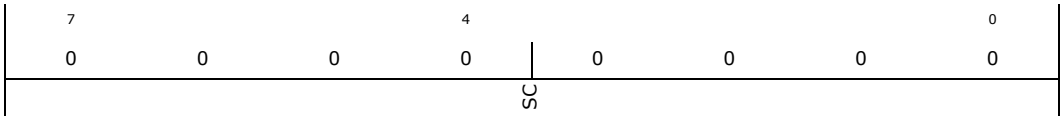
32.6.8 Scratchpad Register (COM1_SCR)—Offset 3FFh

Access Method

Type: I/O Register (Size: 8 bits)

COM1_SCR: 3FFh

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Scratchpad (SC):** This register is for programmers to use as a temporary storage space.

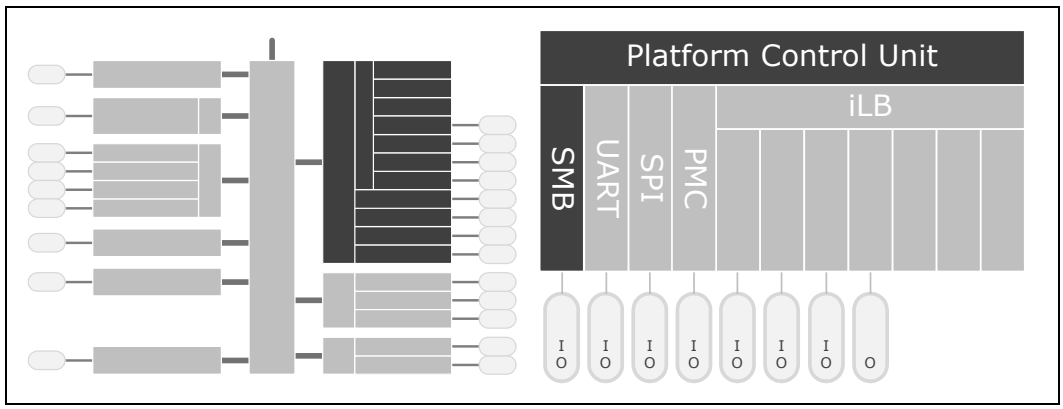
33 PCU – System Management Bus (SMBus)

The SoC provides a System Management Bus (SMBus) 2.0 host controller. The host controller provides a mechanism for the processor to initiate communications with SMBus peripherals (slaves). The SoC is also capable of operating in a mode in which it can communicate with I^2C compatible devices.

The SoC can perform SMBus messages with packet error checking (PEC) enabled or disabled. The actual PEC calculation and checking can be performed in either hardware or software.

The SMBus Address Resolution Protocol (ARP) is supported by using the existing host controller commands through software, except for the Host Notify command (which is actually a received message).

The programming model of the host controller is combined into two portions: a PCI configuration portion, and a system I/O mapped portion. All static configuration, such as the I/O base address, is done using the PCI configuration space. Real-time programming of the Host interface is done in system I/O space.



33.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

Table 310. SMBus Signal Names

Signal Name	Direction Plat. Power	Description
PCU_SMB_ALERT#	I/OD V1P8S	**SMBus Alert:** This signal is used to generate internal SMI#. *This signal is muxed and may be used by other functions.*
PCU_SMB_CLK	I/OD V1P8S	**SMBus Clock:** External pull-up resistor is required. *This signal is muxed and may be used by other functions.*
PCU_SMB_DATA	I/OD V1P8S	**SMBus Data:** External pull-up resistor is required. *This signal is muxed and may be used by other functions.*

33.2 Features

33.2.1 Host Controller

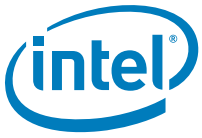
The SMBus host controller is used to send commands to other SMBus slave devices. Software sets up the host controller with an address, command, and, for writes, data and optional PEC; and then tells the controller to start. When the controller has finished transmitting data on writes, or receiving data on reads, it generates an SMI# or interrupt, if enabled.

The host controller supports 8 command protocols of the SMBus interface (see *System Management Bus (SMBus) Specification, Version 2.0*): Quick Command, Send Byte, Receive Byte, Write Byte/Word, Read Byte/Word, Process Call, Block Read/Write and Block Write–Block Read Process Call. Additionally, it supports 1 command protocol for I^2C devices: I^2C Read.

The SMBus host controller requires that the various data and command fields be setup for the type of command to be sent. When software sets the START bit, the SMBus Host controller performs the requested transaction, and interrupts the processor (or generates an SMI#) when the transaction is completed. Once a START command has been issued, the values of the "active registers" (Host Control (SMB_Mem_HCTL), Host Command (SMB_Mem_HCMD), Transmit Slave Address (SMB_Mem_TSA), Data 0 (SMB_Mem_HD0), Data 1 (SMB_Mem_HD1)) should not be changed or read until the interrupt status message (SMB_Mem_HSTS.INTR) has been set (indicating the completion of the command). Any register values needed for computation purposes should be saved prior to issuing of a new command, as the SMBus host controller updates all registers while completing the new command.

33.2.1.1 Command Protocols

In all of the following commands, the Host Status (SMB_Mem_HSTS) register is used to determine the progress of the command. While the command is in operation, the SMB_Mem_HSTS.HBSY bit is set. If the command completes successfully, the SMB_Mem_HSTS.INTR bit will be set. If the device does not respond with an



acknowledge, and the transaction times out, the SMB_Mem_HSTS.DEVERR bit is set. If software sets the SMB_Mem_HCTL.KILL bit while the command is running, the transaction will stop and the SMB_Mem_HSTS.FAILED bit will be set.

Quick Command

When programmed for a Quick Command, the Transmit Slave Address (SMB_Mem_TSA) register is sent. The PEC byte is never appended to the Quick Protocol. Software should force the SMB_Config_HCTL.PECEN bit to 0b when performing the Quick Command. Software must force the SMB_Config_HCFG.I2C_EN bit to 0b when running this command. See section 5.5.1 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

Send Byte / Receive Byte

For the Send Byte command, the Transmit Slave Address (SMB_Mem_TSA) and Host Command (SMB_Mem_HCMD) registers are sent. For the Receive Byte command, the Transmit Slave Address (SMB_Mem_TSA) register is sent. The data received is stored in the Data 0 (SMB_Mem_HD0) register. Software must force the SMB_Config_HCFG.I2C_EN bit to 0b when running this command.

The Receive Byte is similar to a Send Byte, the only difference is the direction of data transfer. See sections 5.5.2 and 5.5.3 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

Write Byte/Word

The first byte of a Write Byte/Word access is the command code. The next 1 or 2 bytes are the data to be written. When programmed for a Write Byte/Word command, the Transmit Slave Address (SMB_Mem_TSA), Host Command (SMB_Mem_HCMD), and Data 0 (SMB_Mem_HD0) registers are sent. In addition, the Data 1 (SMB_Mem_HD1) register is sent on a Write Word command. Software must force the SMB_Config_HCFG.I2C_EN bit to 0 when running this command. See section 5.5.4 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

Read Byte/Word

Reading data is slightly more complicated than writing data. First the SoC must write a command to the slave device. Then it must follow that command with a repeated start condition to denote a read from that device's address. The slave then returns 1 or 2 bytes of data. Software must force the SMB_Config_HCFG.I2C_EN bit to 0b when running this command.

When programmed for the read byte/word command, the Transmit Slave Address (SMB_Mem_TSA) and Host Command (SMB_Mem_HCMD) registers are sent. Data is received into the Data 0 (SMB_Mem_HD0) on the read byte, and the Data 0

(SMB_Mem_HD0) and Data 1 (SMB_Mem_HD1) registers on the read word. See section 5.5.5 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

Process Call

The process call is so named because a command sends data and waits for the slave to return a value dependent on that data. The protocol is simply a Write Word followed by a Read Word, but without a second command or stop condition.

When programmed for the Process Call command, the SoC transmits the Transmit Slave Address (SMB_Mem_TSA), Host Command (SMB_Mem_HCMD), Data 0 (SMB_Mem_HD0) and Data 1 (SMB_Mem_HD1) registers. Data received from the device is stored in the Data 0 (SMB_Mem_HD0) and Data 1 (SMB_Mem_HD1) registers. The Process Call command with SMB_Config_HCFG.I2C_EN set and the SMB_Config_HCTL.PECEN bit set produces undefined results. Software must force either SMB_Config_HCFG.I2C_EN or SMB_Config_HCTL.PECEN & SMB_Mem_AUXC.AAC to 0b when running this command. See section 5.5.6 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

Note: For process call command, the value written into SMB_Mem_TSA.RW needs to be 0b.

Note: If the SMB_Config_HCFG.I2C_EN bit is set, the protocol sequence changes slightly: the Command Code (Bits 18:11 in the bit sequence) are not sent - as a result, the slave will not acknowledge (Bit 19 in the sequence).

Block Read/Write

The SoC contains a 32-byte buffer for read and write data which can be enabled by setting SMB_Mem_AUXC.E32B, as opposed to a single byte of buffering. This 32-byte buffer is filled with write data before transmission, and filled with read data on reception. In the SoC, the interrupt is generated only after a transmission or reception of 32 bytes, or when the entire byte count has been transmitted/received.

Note: When operating in I^2C mode (SMB_Config_HCFG.I2C_EN bit is set), the SoC will never use the 32-byte buffer for any block commands.

The byte count field is transmitted but ignored by the SoC as software will end the transfer after all bytes it cares about have been sent or received.

For a Block Write, software must either force the SMB_Config_HCFG.I2C_EN bit or both the SMB_Config_HCTL.PECEN and SMB_Mem_AUXC.AAC bits to 0b when running this command.

The block write begins with a slave address and a write condition. After the command code the SoC issues a byte count describing how many more bytes will follow in the message. If a slave had 20 bytes to send, the first byte would be the number 20 (14h), followed by 20 bytes of data. The byte count may not be 0. A Block Read or Write is allowed to transfer a maximum of 32 data bytes.

When programmed for a block write command, the Transmit Slave Address (SMB_Mem_TSA), Host Command (SMB_Mem_HCMD) and Data 0 (SMB_Mem_HD0) registers are sent. Data is then sent from the Host Block Data (SMB_Mem_HBD) register; the total data sent being the value stored in the Data 0 (SMB_Mem_HD0) register. On block read commands, the first byte received is stored in the Data 0 (SMB_Mem_HD0) register, and the remaining bytes are stored in the Host Block Data (SMB_Mem_HBD) register. See section 5.5.7 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

Note: For Block Write, if the SMB_Config_HCFG.I2C_EN bit is set, the format of the command changes slightly. The SoC will still send the number of bytes (on writes) or receive the number of bytes (on reads) indicated in the Data 0 (SMB_Mem_HD0) register. However, it will not send the contents of the Data 0 (SMB_Mem_HD0) register as part of the message. Also, the Block Write protocol sequence changes slightly: the Byte Count (bits 27:20 in the bit sequence) are not sent - as a result, the slave will not acknowledge (bit 28 in the sequence).

Block Write–Block Read Process Call

The block write-block read process call is a two-part message. The call begins with a slave address and a write condition. After the command code the host issues a write byte count (M) that describes how many more bytes will be written in the first part of the message. If a master has 6 bytes to send, the byte count field will have the value 6 (0000 0110b), followed by the 6 bytes of data. The write byte count (M) cannot be 0.

The second part of the message is a block of read data beginning with a repeated start condition followed by the slave address and a Read bit. The next byte is the read byte count (N), which may differ from the write byte count (M). The read byte count (N) cannot be 0.

The combined data payload must not exceed 32 bytes. The byte length restrictions of this process call are summarized as follows:

- $M \geq 1$ byte
- $N \geq 1$ byte
- $M + N \leq 32$ bytes

The read byte count does not include the PEC byte. The PEC is computed on the total message beginning with the first slave address and using the normal PEC computational rules. It is highly recommended that a PEC byte be used with the Block Write-Block Read Process Call. Software must do a read to the Host Command (SMB_Mem_HCMD) register to reset the 32 byte buffer pointer prior to reading the Host Block Data (SMB_Mem_HBD) register.

Note that there is no STOP condition before the repeated START condition, and that a NACK signifies the end of the read transfer.

Note: The SMB_Mem_AUXC.E32B bit in the Auxiliary Control register must be set when using this protocol.

See section 5.5.8 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

I²C Read

This command allows the SoC to perform block reads to certain I²C devices, such as serial EEPROMs. The SMBus Block Read supports the 7-bit addressing mode only.

However, this does not allow access to devices using the I²C "Combined Format" that has data bytes after the address. Typically these data bytes correspond to an offset (address) within the serial memory chips.

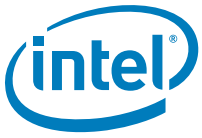
Note: This command is supported independent of the setting of the SMB_Config_HCFG.I2C_EN bit. The I²C Read command with the SMB_Config_HCTL.PECEN bit set produces undefined results. Software must force both the SMB_Config_HCTL.PECEN and SMB_Mem_AUXC.AAC bit to 0b when running this command.

For I²C Read command, the value written into SMB_Mem_TSA.RW needs to be 1b. The format that is used for the command is shown in below table.

Table 311. I²C Block Read

Bit	Description
1	Start
8:2	Slave Address – 7 bits
9	Write
10	Acknowledge from slave
18:11	Send Data 1 (SMB_Mem_HD1) register
19	Acknowledge from slave
20	Repeated Start
27:21	Slave Address – 7 bits
28	Read
29	Acknowledge from slave
37:30	Data byte 1 from slave – 8 bits
38	Acknowledge
46:39	Data byte 2 from slave – 8 bits
47	Acknowledge
–	Data bytes from slave / Acknowledge
–	Data byte N from slave – 8 bits
–	NOT Acknowledge
–	Stop

The SoC will continue reading data from the peripheral until the NAK is received.



33.2.2 Bus Arbitration

Several masters may attempt to get on the bus at the same time by driving the PCU_SMB_DATA line low to signal a start condition. The SoC continuously monitors the PCU_SMB_DATA line. When the SoC is attempting to drive the bus to a 1 by letting go of the PCU_SMB_DATA line, and it samples PCU_SMB_DATA low, then some other master is driving the bus and the SoC will stop transferring data.

If the SoC sees that it has lost arbitration, the condition is called a collision. The SoC will set SMB_Mem_HSTS.BERR, and if enabled, generate an interrupt or SMI#. The processor is responsible for restarting the transaction.

The SoC, as a SMBus master, drives the clock. When the SoC is sending address or command or data bytes on writes, it drives data relative to the clock it is also driving. It will not start toggling the clock until the start or stop condition meets proper setup and hold time. The SoC will also ensure minimum time between SMBus transactions as a master.

33.2.3 Bus Timing

33.2.3.1 Clock Stretching

Some devices may not be able to handle their clock toggling at the rate that the SoC as an SMBus master would like. They have the capability of stretching the low time of the clock. When the SoC attempts to release the clock (allowing the clock to go high), the clock will remain low for an extended period of time.

The SoC monitors the SMBus clock line after it releases the bus to determine whether to enable the counter for the high time of the clock. While the bus is still low, the high time counter must not be enabled. Similarly, the low period of the clock can be stretched by an SMBus master if it is not ready to send or receive data.

33.2.3.2 Bus Time Out (SoC as SMBus Master)

If there is an error in the transaction, such that an SMBus device does not signal an acknowledge, or holds the clock lower than the allowed time-out time, the transaction will time out. The SoC will discard the cycle and set the SMB_Mem_HSTS.DEVERR bit. The time out minimum is 25 ms (800 RTC clocks). The time-out counter inside the SoC will start after the last bit of data is transferred by the SoC and it is waiting for a response.

The 25-ms time-out counter will not count under the following conditions:

1. The SMB_Mem_HSTS.BYTE_DONE_STS bit is set

2. The TCO_STS.SECOND_TO_STS bit is not set (this indicates that the system has not locked up).

33.2.4 Interrupts / SMI#

The SoC SMBus controller uses INTB as its virtual interrupt wire. However, the system can alternatively be set up to generate SMI# instead of an interrupt, by setting the SMB_Config_HCFG.SMI_EN bit.

Below tables specify how the various enable bits in the SMBus function control the generation of the interrupt and Host SMI internal signals. The rows in the tables are additive, which means that if more than one row is true for a particular scenario then the Results for all of the activated rows will occur.

Table 312. Enable for PCU_SMB_ALERT#

Event	SMB_Mem_ HCTL.INTREN	SMB_Config_ HCFG.SMI_EN	SMB_Mem_ SCMD.SMBALTDIS	Result
PCU_SMB_ALERT# asserted low (always reported in SMB_Mem_ HSTS.SMBALERT)	X	1	0	Slave SMI# generated (SMBUS_SMI_STS)
	1	0	0	Interrupt generated

Table 313. Enables for SMBus Host Events

Event	SMB_Mem_ HCTL.INTREN	SMB_Config_ HCFG.SMI_EN	Event
Any combination of SMB_Mem_HSTS. FAILED, SMB_Mem_HSTS. BERR, SMB_Mem_HSTS. DEVERR, SMB_Mem_HSTS. INTR asserted	0	X	None
	1	0	Interrupt generated
	1	1	Host SMI# generated

Table 314. Enables for the Host Notify Command

SMB_Mem_ SCMD.HNINTREN	SMB_Config_ HCFG.SMI_EN	SMB_Mem_ SCMD.HNWAKEEN	Result
0	X	0	None
1	0	X	Interrupt generated
1	1	X	Slave SMI# generated (SMBUS_SMI_STS)

33.2.5 PCU_SMB_ALERT#

PCU_SMB_ALERT# is multiplexed with GPIO_S0_SC[53]. When enabled and the signal is asserted, the SoC can generate an interrupt or an SMI#.

Note: Using this signal as a wake event from is not supported.

33.2.6 SMBus CRC Generation and Checking

If the SMB_Mem_AUXC.AAC is set, the SoC automatically calculates and drives CRC at the end of the transmitted packet for write cycles, and will check the CRC for read cycles. It will not transmit the contents of the Packet Error Check Data Register (SMB_Mem_PEC) PEC register for CRC. The SMB_Mem_HCTL.PECEN bit must not be set if this bit is set, or unspecified behavior will result.

If the read cycle results in a CRC error, the SMB_Mem_HSTS.DEVERR bit and the SMB_Mem_AUXS.CRCE bit will be set.

33.2.7 SMBus Slave Interface

The SoC does not implement a complete SMBus slave interface. Only the Host Notify Command is implemented to maintain specification compatibility.

33.2.7.1 Format of Host Notify Command

The SoC tracks and responds to the standard Host Notify command as specified in the System Management Bus (SMBus) Specification, Version 2.0. The host address for this command is fixed to 0001000b. If the SoC already has data for a previously-received host notify command which has not been serviced yet by the host software (as indicated by the SMB_Mem_SSTS.HNST bit), then it will NACK following the host address byte of the protocol. This allows the host to communicate non-acceptance to the master and retain the host notify address and data values for the previous cycle until host software completely services the interrupt.

Note: Host software must always clear the SMB_Mem_SSTS.HNST bit after completing any necessary reads of the address and data registers.

Below table shows the Host Notify format.

Table 315. Host Notify Format (Sheet 1 of 2)

Bit	Description	Driven By	Comment
1	Start	External Master	
8:2	SMB Host Address – 7 bits	External Master	Always 0001_000
9	Write	External Master	Always 0
10	ACK (or NACK)	SoC	SoC NACKs if SMB_Mem_SSTS.HNST is 1
17:11	Device Address – 7 bits	External Master	Indicates the address of the master; loaded into the Notify Device Address Register (SMB_Mem_NDA)
18	Unused – Always 0	External Master	7-bit-only address; this bit is inserted to complete the byte
19	ACK	SoC	

Table 315. Host Notify Format (Sheet 2 of 2)

Bit	Description	Driven By	Comment
27:20	Data Byte Low – 8 bits	External Master	Loaded into the Notify Data Low Byte Register (SMB_Mem_NDLB)
28	ACK	SoC	
36:29	Data Byte High – 8 bits	External Master	Loaded into the Notify Data High Byte Register (SMB_Mem_NDHB)
37	ACK	SoC	
38	Stop	External Master	

33.3 Use

33.3.1 Function Disable

The SMBus interface may be disable by setting FUNC_DIS_2.SMB_DIS to 1b.

33.3.2 SPD Write Disable

DRAM memory modules contain a 256-byte EEPROM, called SPD, accessible via SMBus used to store configuration information such as timing, physical size and more. A malicious user with administrative privileges can change and permanently lock invalid settings which could then lead to a permanent denial of service attack or a memory aliasing attack.

Write access to the SPI should be disabled by setting SMB_Config_HCFG.SPD_WD to 1b.

5	0b RO	**66 MHz Capable (FREQ66):** 66 MHz Capable - reserved as '0'
4	1b RO	**Capabilities List Indicator (CLI):** Capabilities List Indicator - set to '1'
3	0b RO	**INTS:** This bit indicates that an interrupt is pending. It is independent from the state of the Interrupt Enable bit in the command register
2:0	000b RO	**Reserved (RSV):** Reserved

33.6.5 D31_F3_Revision ID (SMB_Config_REV)—Offset 8h

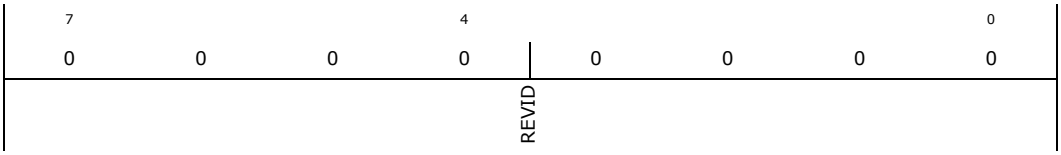
The value reported in this register is coming from centralize unit by the SETIDVALUE message

Access Method

Type: PCI Configuration Register (Size: 8 bits)

SMB_Config_REV: [B:0, D:31, F:3] + 8h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RO	**Revision ID (REVID):** Revision ID

33.6.6 D31_F3_Programming Interface (SMB_Config_PRGIF)—Offset 9h

The value reported in this register is coming from centralize unit by the SETIDVALUE message

Access Method

Type: PCI Configuration Register (Size: 8 bits)

SMB_Config_PRGIF: [B:0, D:31, F:3] + 9h

Default: 00h

Bit Range	Default & Access	Description
7:0	00h RO	**Programming Interface (PRGIF):** Programming Interface

33.6.7 D31_F3_Sub Class Code (SMB_config_SCC)—Offset Ah

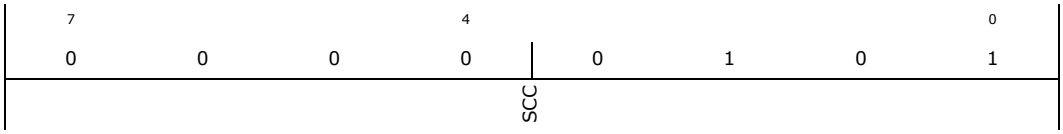
A value of 05h indicates that this device is a SM Bus serial controller

Access Method

Type: PCI Configuration Register (Size: 8 bits)

SMB_config_SCC: [B:0, D:31, F:3] + Ah

Default: 05h



Bit Range	Default & Access	Description
7:0	05h RO	**SCC:** Sub Class Code

33.6.8 D31_F3_Base Class Code (SMB_Config_BCC)—Offset Bh

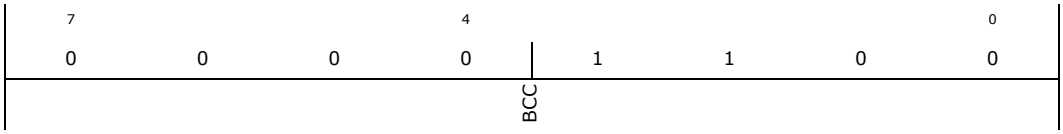
A value of 0Ch indicates that this device is a serial controller

Access Method

Type: PCI Configuration Register (Size: 8 bits)

SMB_Config_BCC: [B:0, D:31, F:3] + Bh

Default: 0Ch



Bit Range	Default & Access	Description
7:0	0Ch RO	**BCC:** Base Class Code

33.6.9 D31_F3_SMBus Memory Base Address (SMB_Config_MBARL)—Offset 10h

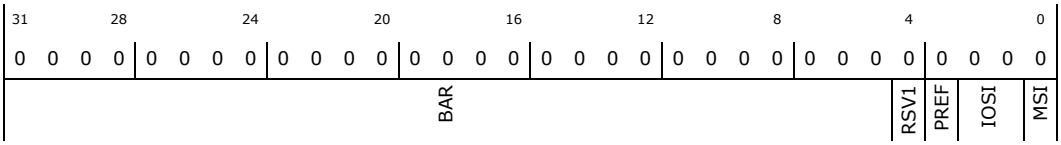
The memory bar

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SMB_Config_MBARL: [B:0, D:31, F:3] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	000000h RW	**BAR:** Base Address - Provides the 32 byte system memory base address
4	0b RO	**Reserved (RSV1):** Reserved
3	0b RO	**PREF:** Hardwired to 0. Indicated that SMBMBAR is not prefetchable
2:1	00b RO	**Type (IOSI):** This field is hardwired to 2'b00 indicating that this range can be mapped anywhere within 32-bit address space.
0	0b RO	**MSI:** Memory Space Indicator - This read-only bit always is 0, indicating that the SMB logic is Memory mapped

33.6.10 D31_F3_SMBus Memory Base Address (SMB_Config_MBARH)—Offset 14h

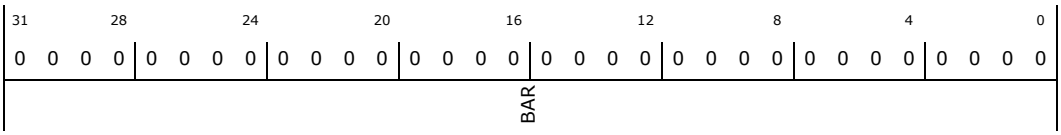
RESERVED

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SMB_Config_MBARH: [B:0, D:31, F:3] + 14h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**BAR:** RESERVED

33.6.11 D31_F3_SMB Base Addr (SMB_Config_IOBAR)—Offset 20h

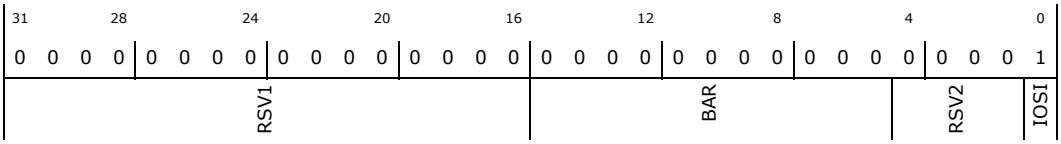
The I/O memory bar

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SMB_Config_IOBAR: [B:0, D:31, F:3] + 20h

Default: 00000001h



Bit Range	Default & Access	Description
31:16	0000h RO	**Reserved (RSV1):** Reserved
15:5	0000000000b RW	**BAR:** Base Address - Provides the 32 byte system I/O base address
4:1	0000b RO	**Reserved (RSV2):** Reserved
0	1b RO	**I/O Space Indicator (IOSI):** IO Space Indicator - This read-only bit always is 1, indicating that the SMB logic is I/O mapped

33.6.12 D31_F3_SVID (SMB_Config_SVID)—Offset 2Ch

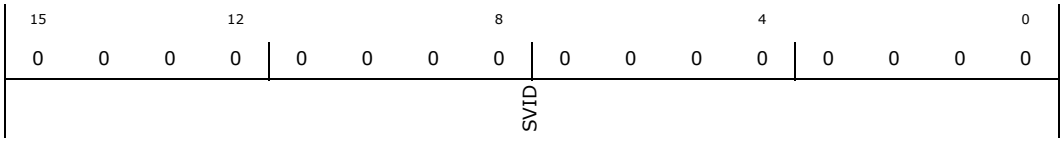
BIOS sets the value in this register to identify the Subsystem Vendor ID. The SMBus SVID register, in combination with the SMBus Subsystem ID register, enables the operating system to distinguish each subsystem from the others. **Note: The software can write to this register only once per core well reset. Writes should be done as a single 16-bit cycle.**

Access Method

Type: PCI Configuration Register (Size: 16 bits)

SMB_Config_SVID: [B:0, D:31, F:3] + 2Ch

Default: 0000h



Bit Range	Default & Access	Description
15:0	0000h RW/O	**SVID:** Subsystem Vendor ID

33.6.13 D31_F3_SID (SMB_Config_SID)—Offset 2Eh

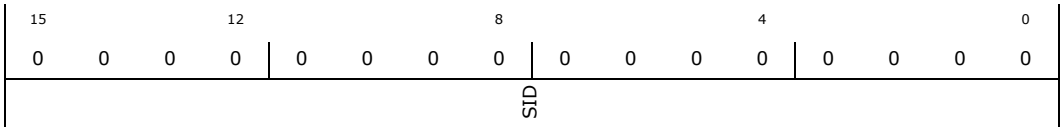
BIOS can write to this register to identify the Subsystem ID. The SID register, in combination with the SVID, enable the operating system to distinguish each subsystem from other(s). **Note: The software can write to this register only once per core well reset. Writes should be done as a single 16-bit cycle.**

Access Method

Type: PCI Configuration Register (Size: 16 bits)

SMB_Config_SID: [B:0, D:31, F:3] + 2Eh

Default: 0000h



Bit Range	Default & Access	Description
15:0	0000h RW/O	**SID:** Subsystem ID

33.6.14 D31_F3_CAP_POINTER (SMB_Config_CAP_POINTER)—Offset 34h

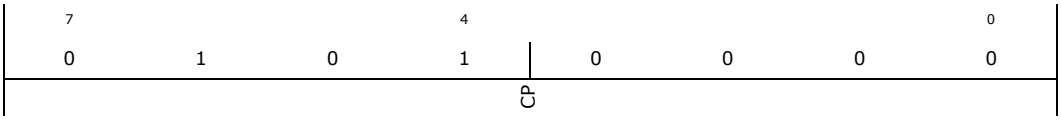
This optional register is used to point to a linked list of new capabilities implemented by this device. This register is only valid if the Capabilities List bit in the Status Register is set. If implemented, the bottom two bits are reserved and should be set to 00b. Software should mask these bits off before using this register as a pointer in Configuration Space to the first entry of a linked list of new capabilities.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

SMB_Config_CAP_POINTER: [B:0, D:31, F:3] + 34h

Default: 50h



Bit Range	Default & Access	Description
7:0	50h RO	**Capability Pointer (CP):** Indicates the offset of the first Capability Item.

33.6.15 D31_F3_Interrupt Line (SMB_Config_INTLN)—Offset 3Ch

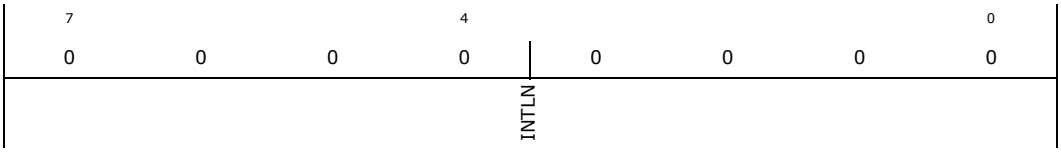
This data is not used

Access Method

Type: PCI Configuration Register (Size: 8 bits)

SMB_Config_INTLN: [B:0, D:31, F:3] + 3Ch

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**INTLN:** Intrerrupt Line

33.6.16 D31_F3_Interrupt Pin (SMB_Config_INTPN)—Offset 3Dh

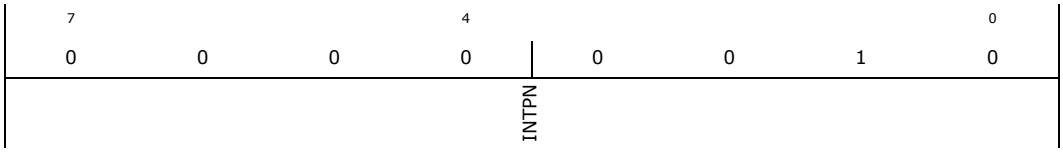
This register reflects the D31IP.SMIP in chipset configuration space

Access Method

Type: PCI Configuration Register (Size: 8 bits)

SMB_Config_INTPN: [B:0, D:31, F:3] + 3Dh

Default: 02h



Bit Range	Default & Access	Description
7:0	02h RO	**INTPN:** The 4 msb bits are hardwired to 0, and the 4 lsb bitsare hardwired to 4'h2 indicates the INTB is used by the SMBus controller

33.6.17 D31_F3_Host Configuration (SMB_Config_HCFG)—Offset 40h

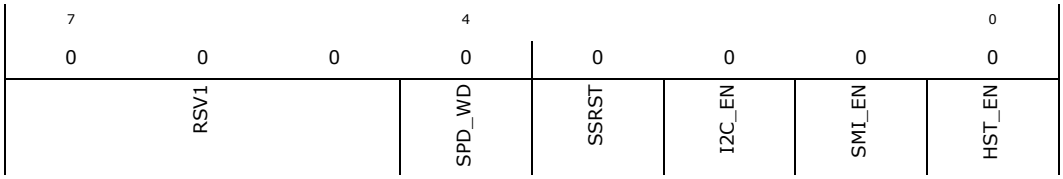
Host Configuration Register

Access Method

Type: PCI Configuration Register (Size: 8 bits)

SMB_Config_HCFG: [B:0, D:31, F:3] + 40h

Default: 00h



Bit Range	Default & Access	Description
7:5	000b RO	**Reserved (RSV1):** Reserved
4	0b RW/O	**SPD write disable (SPD_WD):** This bit is must be set to 1b1 to disable writes to SPD which are on Host SMB address ranges 0xA0 0xAE. The SMBus range is unwriteable until next platform reset HW Default is 1b0. Note: This bit is locked on 1b1 and will be reset on PLTRST# reset. This should be set by BIOS memory reference code to 1b1. SW can only program this bit when both HCTL[6] = 1b0 (START) and HSTS[0] = 1b0 (HBSY), else it may result in an undefined behavior.
3	0b RW	**SSRST:** Soft SMBus Reset - When this bit is 1, the SMbus state machine and logic is reset. The HW will reset this bit to 0 when reset operation is completed
2	0b RW	**I2C_EN:** When this bit is 1, the SMBus host is enabled to communicate with I2C devices. This will change the formatting of some commands. When this bit is 0, behavior is for SMBus
1	0b RW	**SMI_EN:** When this bit is set, any source of an SMB interrupt will instead be routed to generate an SMI

Bit Range	Default & Access	Description
0	0b RW	**HST_EN:** When set, the SMB Host Controller interface is enabled to execute commands. The SMB_Mem_HCTL.INTREN bit needs to be enabled in order for the SMB Host Controller to interrupt or SMI#. Additionally, the SMB Host Controller will not respond to any new requests until all interrupt requests have been cleared

33.6.18 D31_F3_PID (SMB_Config_CAP_ID)—Offset 50h

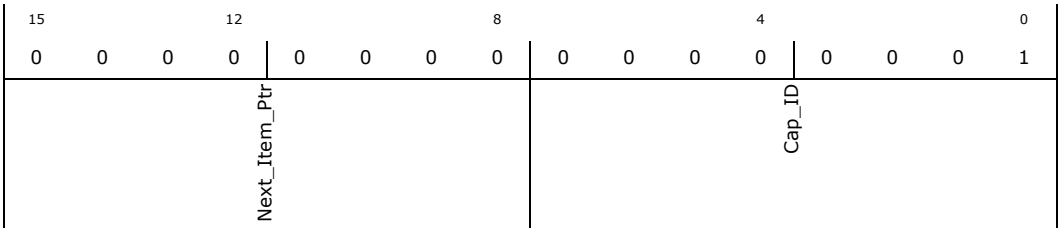
Power Management Capability ID

Access Method

Type: PCI Configuration Register (Size: 16 bits)

SMB_Config_CAP_ID: [B:0, D:31, F:3] + 50h

Default: 0001h



Bit Range	Default & Access	Description
15:8	00h RO	**Next Item Pointer (Next_Item_Ptr):** This field provides an offset into the functions PCI Configuration Space pointing to the location of next item in the functions capability list. If there are no additional items in the Capabilities List, this register is set to 00h.
7:0	01h RO	**Capability Identifier (Cap_ID):** This field, when 01h identifies the linked list item as being the PCI Power Management registers.

33.6.19 D31_F3_PC (SMB_Config_PMC)—Offset 52h

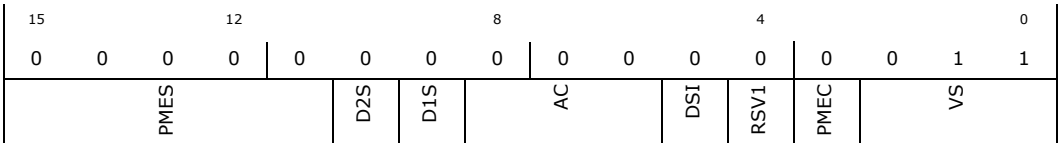
Power Management Capabilities

Access Method

Type: PCI Configuration Register (Size: 16 bits)

SMB_Config_PMC: [B:0, D:31, F:3] + 52h

Default: 0003h



Bit Range	Default & Access	Description
15:11	00000b RO	**PME_Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(11) X XXX1b - PME# can be asserted from D0 bit(12) X XX1Xb - PME# can be asserted from D1 bit(13) X X1XXb - PME# can be asserted from D2 bit(14) X 1XXXb - PME# can be asserted from D3hot bit(15) 1 XXXXb - PME# can be asserted from D3cold

Bit Range	Default & Access	Description
10	0b RO	**D2_Support (D2S):** If this bit is a '1', this function supports the D2 Power Management State. Functions that do not support D2 must always return a value of '0' for this bit.
9	0b RO	**D1_Support (D1S):** If this bit is a '1', this function supports the D1 Power Management State. Functions that do not support D2 must always return a value of '0' for this bit.
8:6	000b RO	**Aux_Current (AC):** Auxiliary current - should be 3'b000
5	0b RO	**DSI:** Device specific initialization
4	0b RO	**Reserved (RSV1):** Reserved
3	0b RO	**PME Clock (PMEC):** PME Clock. Does not apply.
2:0	011b RO	**Version (VS):** A value of 011b indicates that this function complies with revision 1.2 of the PCI Power Management Interface Specification.

33.6.20 D31_F3_PMCSR (SMB_Config_PMCSR)—Offset 54h

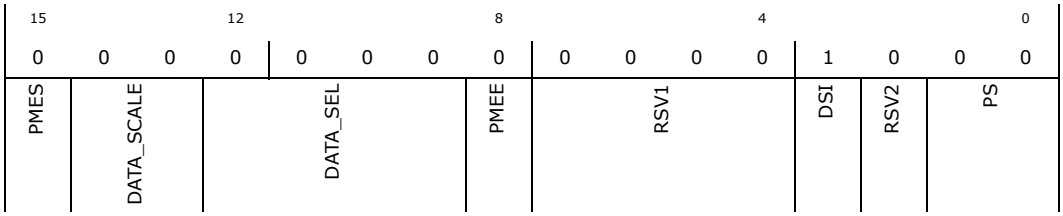
Power Management Control/Status Register

Access Method

Type: PCI Configuration Register (Size: 16 bits)

SMB_Config_PMCSR: [B:0, D:31, F:3] + 54h

Default: 0008h



Bit Range	Default & Access	Description
15	0b RO	**PME_Status (PMES):** SMBus does not initiate PME#. Hence this bit should be always '0'
14:13	00b RO	**Data_Scale (DATA_SCALE):** If the Data register has not been implemented, this field must return '00b' when the PMCSR is read.
12:9	0000b RO	**Data_Select (DATA_SEL):** If the Data register is not implemented, this field should be read only and return '0000b' when the PMCSR is read.
8	0b RO	**PME_En (PMEE):** Should be '0' since SMBus does not initiate PME#
7:4	0000b RO	**Reserved (RSV1):** Reserved

Bit Range	Default & Access	Description
3	1b RO	**No_Soft_Reset (DSI):** When set (1), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0b RO	**Reserved (RSV2):** Reserved
1:0	00b RW	**PowerState (PS):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the field values is given below. 00b - D0 01b - D1 10b - D2 11b - D3hot If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs.

33.6.21 D31_F3_PMCSR_BSE (SMB_Config_PMCSR_BSE)—Offset 56h

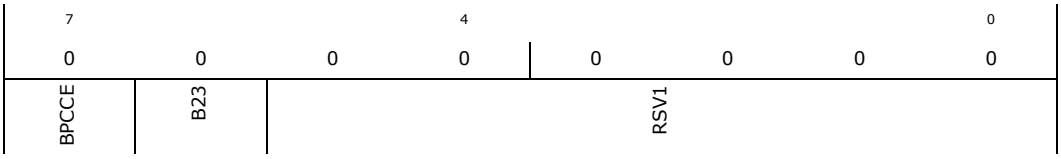
PMCSR_BSE supports PCI bridge specific functionality and is required for all PCI-to-PCI bridges.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

SMB_Config_PMCSR_BSE: [B:0, D:31, F:3] + 56h

Default: 00h



Bit Range	Default & Access	Description
7	0b RO	**BPCC_En (BPCCE):** Bus Power/Clock Control Enable - Does not apply
6	0b RO	**B2_B3 (B23):** B2/B3 support for D3hot - Does not apply
5:0	00h RO	**Reserved (RSV1):** Reserved

33.6.22 D31_F3_DATA (SMB_Config_DATA)—Offset 57h

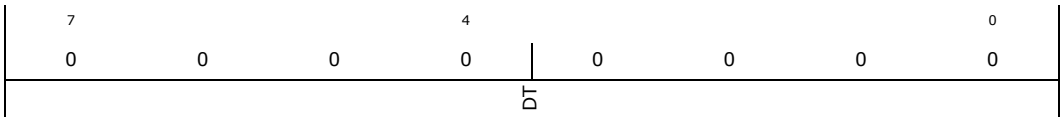
PMCSR_BSE supports PCI bridge specific functionality and is required for all PCI-to-PCI bridges.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

SMB_Config_DATA: [B:0, D:31, F:3] + 57h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RO	**Data (DT):** Data - Does not apply

33.6.23 IOSF Error Control (SMB_Config_ERR)—Offset F0h

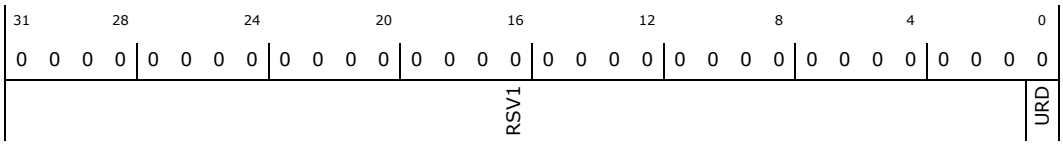
IOSF Error Control- is set when an Unsupported Request Detected

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SMB_Config_ERR: [B:0, D:31, F:3] + F0h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0000h RO	**Reserved (RSV1):** Reserved
0	0b RW	**URD:** Unsupported Request Detected, SMBus could not receive unsupported request hence this bit is tied to 1b0

33.6.24 D31_F3_Manufacturer's ID (SMB_Config_MANID)—Offset F8h

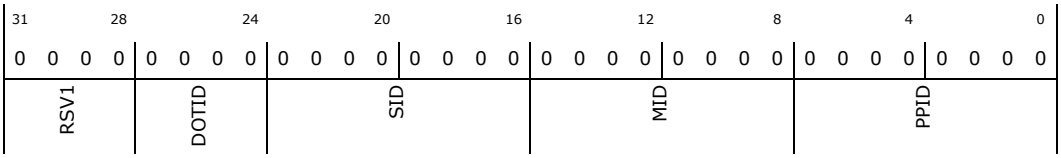
Manufacturer's ID Register,The value reported in this register is coming from centralize unit by the SETIDVALUE message

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SMB_Config_MANID: [B:0, D:31, F:3] + F8h

Default: 00000000h



Bit Range	Default & Access	Description
31:28	00h RO	**Reserved (RSV1):** Reserved
27:24	0000b RO	**DOTID:** The value reported in this field is coming from centralize unit by the SETIDVALUE message
23:16	00h RO	**SID:** The value reported in this field is coming from centralize unit by the SETIDVALUE message
15:8	00h RO	**MID:** The value reported in this field is coming from centralize unit by the SETIDVALUE message
7:0	00h RO	**PPID:** The value reported in this field is coming from centralize unit by the SETIDVALUE message

33.7 PCU SMBUS Memory Mapped I/O Registers

Table 317. Summary of PCU SMBUS Memory Mapped I/O Registers—SMB_Config_MBARL

Offset	Size	Register ID—Description	Default Value
0h	1	"Host Status Register (SMB_Mem_HSTS)—Offset 0h" on page 4466	00h
2h	1	"Host Control Register (SMB_Mem_HCTL)—Offset 2h" on page 4467	00h
3h	1	"Host Command Register (SMB_Mem_HCMD)—Offset 3h" on page 4470	00h
4h	1	"Transmit Slave Address Register (SMB_Mem_TSA)—Offset 4h" on page 4470	00h
5h	1	"Data 0 Register (SMB_Mem_HD0)—Offset 5h" on page 4471	00h
6h	1	"Data 1 Register (SMB_Mem_HD1)—Offset 6h" on page 4471	00h
7h	1	"Host Block Data (SMB_Mem_HBD)—Offset 7h" on page 4471	00h
8h	1	"Packet Error Check Data Register (SMB_Mem_PEC)—Offset 8h" on page 4472	00h
Ch	1	"Auxiliary Status (SMB_Mem_AUXS)—Offset Ch" on page 4473	00h
Dh	1	"Auxiliary Control (SMB_Mem_AUXC)—Offset Dh" on page 4473	00h

10h	1	"Slave Status Register (SMB_Mem_SSTS)—Offset 10h" on page 4474	00h
11h	1	"Slave Command Register (SMB_Mem_SCMD)—Offset 11h" on page 4475	00h
14h	1	"Notify Device Address Register (SMB_Mem_NDA)—Offset 14h" on page 4476	00h
16h	1	"Notify Data Low Byte Register (SMB_Mem_NDLB)—Offset 16h" on page 4476	00h
17h	1	"Notify Data High Byte Register (SMB_Mem_NDHB)—Offset 17h" on page 4477	00h

33.7.1 Host Status Register (SMB_Mem_HSTS)—Offset 0h

All status bits are set by hardware and cleared by the software writing a one to the particular bit position. Writing a zero to any bit position has no affect

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_HSTS: [MBARL] + 0h

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
BDS	IUS	SMB_ALERTB	FAILED	BERR	DEVERR	INTR	HBSY

Bit Range	Default & Access	Description
7	0b RW	**BDS:** BYTE_DONE_STS (BDS) - This bit will be set to 1 when the host controller has received a byte (for Block Read commands) or if it has completed transmission of a byte (for Block Write commands) when the 32-byte buffer is not being used. Note that this bit will be set, even on the last byte of the transfer. Software clears the bit by writing a 1 to the bit position. This bit has no meaning for block transfers when the 32-byte buffer is enabled.**Note: When the last byte of a block message is received, the host controller will set this bit. However, it will not immediately set the INTR bit (bit 1 in this register). When the interrupt handler clears the BYTE_DONE_STS bit, the message is considered complete, and the host controller will then set the INTR bit (and generate another interrupt). Thus, for a block message of n bytes, the SMBus host will generate n+1 interrupts. The interrupt handler needs to be implemented to handle these cases.**
6	0b RW	**IUS:** In Use Status (IUS) - After a full PCI reset, a read to this bit returns a 0. After the first read, subsequent reads will return a 1. A write of a 1 to this bit will reset the next read value to 0. Writing a 0 to this bit has no effect. Software can poll this bit until it reads a 0, and will then own the usage of the host controller. This bit has no other effect on the hardware, and is only used as semaphore among various independent software threads that may need to use the SMBus host
5	0b RW	**SMB_ALERTB:** the SOC sets this bit to a '1' to indicates source of the interrupt or SMI# was the SMB_ALERTB signal. Software resets this bit by writing a 1 to this location.
4	0b RW	**FAILED:** Failed (FAIL) - When set, this indicates that the source of the interrupt or SMI was a failed bus transaction. This is set in response to the KILL bit being set to terminate the host transaction.
3	0b RW	**BERR:** Bus Error (BERR) - When set, this indicates the source of the interrupt or SMI was a transaction collision.
2	0b RW	**DEVERR:** Device Error (DERR) - When set, this indicates that the source of the interrupt or SMI was due one of the following: Illegal Command Field Unclaimed Cycle (host initiated) Host Device Time-out Error. CRC Error Write Protection Access Error (START bit will be cleared, Device Error will be set and Host Busy is never set because SMB Transaction never took place).
1	0b RW	**INTR:** Interrupt (INTR) - When set, this indicates that the source of the interrupt or SMI was the successful completion of its last command.
0	0b RW	**HBSY:** Host Busy (HBSY) - A '1' indicates that the SMBus host is running a command from the host interface. No SMB registers should be accessed while this bit is set. Exception: The BLOCK DATA REGISTER can be accessed when this bit is set ONLY when the SMB_CMD bits (in Host control register) are programmed for Block command or I2C Read command. This is necessary in order to check the DONE_STS bit.

33.7.2 Host Control Register (SMB_Mem_HCTL)—Offset 2h

Host Control Register

Note: A read to this register will clear the pointer in the 32-byte buffer.

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_HCTL: [MBARL] + 2h

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
PECEN	SATRT	LBYTE	SMBCMD			KILL	INTREN

Bit Range	Default & Access	Description
7	0b RW	**PECEN:** PEC_EN: When set to '1', this bit causes the host controller to perform the SMBus transaction with the Packet Error Checking phase appended. For writes, the value of the PEC byte is transferred from the PEC Register. For reads, the PEC byte is loaded in to the PEC Register. When this bit is cleared to '0', the SMBus host controller does not perform the transaction with the PEC phase appended. This bit must be written prior to the write in which the START bit is set.
6	0b WO	**START (SATRT):** START: This write-only bit is used to initiate the command described in the SMB_CMD field. All registers should be setup prior to writing a '1' to this bit position. This bit always reads zero. The HOST_BUSY bit in the Host Status register (offset 00h) can be used to identify when the SMBus controller has finished the command.
5	0b RW	**LBYTE:** LAST_BYTE: Used for I2C Read commands as an indication that the next byte will be the last one to be received for that block. The algorithm and usage model for this bit will be as follows (assume a message of n bytes): A. When the software sees the BYTE_DONE_STS bit set (bit 7 in the SMBus Host Status Register) for each of bytes 1 through n-2 of the message, the software should then read the Block Data Byte Register to get the byte that was just received. B. After reading each of bytes 1 to n-2 of the message, the software will then clear the BYTE_DONE_STS bit. C. After receiving byte n-1 of the message, the software will then set the 'LAST BYTE' bit. The software will then clear the BYTE_DONE_STS bit. D. The Intel SOC will then receive the last byte of the message (byte n). However, the Intel SOC state machine will see the LAST BYTE bit set, and instead of sending an ACK after receiving the last byte, it will instead send a NAK. E. After receiving the last byte (byte n), the software will still clear the BYTE_DONE_STS bit. However, the LAST_BYTE bit will be irrelevant at that point. Note: This bit may be set when the TCO timer causes the SECOND_TO_STS bit to be set. See the TCO_STS.SECOND_TO_STS register, for more details on that bit. The SMBus device driver should clear the LAST_BYTE bit (if it is set) before starting any new command. Note: In addition to I2C Read Commands, the LAST_BYTE bit will also cause Block Read/Write cycles to stop prematurely (at the end of the next byte).

Bit Range	Default & Access	Description
4:2	000b RW	**SMBCMD:** SMB_CMD - As shown by the bit encoding below, indicates which command the SMBus host is to perform. If enabled, the SMBus host will generate an interrupt or SMI when the command has completed If the value is for a non-supported or reserved command, the SMBus host will set the device error (DEV_ERR) status bit and generate an interrupt when the START bit is set. The SMBus controller will perform no command, and will not operate until DEV_ERR is cleared.***3'b000 - Quick*** The slave address and read/write value (bit 0) are stored in the tx slave address register ***3'b001 - Byte*** This command uses the transmit slave address and command registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 register will contain the read data. ***3'b010 - Byte Data*** This command uses the transmit slave address, command, and DATA0 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, the DATA0 register will contain the read data ***3'b011 - Word Data*** This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 and DATA1 registers will contain the read data. ***3'b100 - Process Call*** This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. After the command completes, the DATA0 and DATA1 registers will contain the read data. ***3'b101 - Block*** This command uses the transmit slave address, command, and DATA0 registers, and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block reads, the count is received and stored in the DATA0 register. Bit 0 of the slave address register selects if this is a read or write command. For writes, data is retrieved from the first n (where n is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. ***3'b110 - I2C Read*** This command uses the transmit slave address, command, DATA0, DATA1 registers, and the Block Data Byte register. The read data is stored in the Block Data Byte register. The Intel SOC will continue reading data until the NAK is received. ***3'b111 - Block Process*** This command uses the transmit slave address, command, DATA0 and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block read, the count is received and stored in the DATA0 register. Bit 0 of the slave address register always indicate a write command. For writes, data is retrieved from the first m (where m is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. **Note: E32B bit in the Auxiliary Control Register must be set for this command to work.**
1	0b RW	**KILL:** KILL - When set, kills the current host transaction taking place, sets the FAILED status bit, and asserts the interrupt (or SMI) selected by the SMB_Cfg_HCFG.SMI_EN field. This bit, once set, must be cleared to allow the SMB Host Controller to function normally
0	0b RW	**INTREN:** Enable the generation of an interrupt or SMI upon the completion of the command. Enables also other interrupt sendings , like ALERT and HOST_NOTIFY

33.7.3 Host Command Register (SMB_Mem_HCMD)—Offset 3h

This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command.

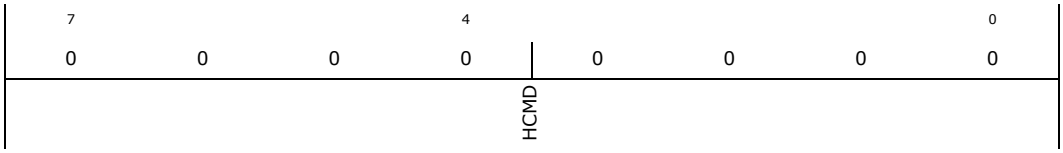
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_HCMD: [MBARL] + 3h

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**HCMD:** Command to be transmitted

33.7.4 Transmit Slave Address Register (SMB_Mem_TSA)—Offset 4h

This register is transmitted by the host controller in the slave address field of the SMB protocol. This is the address of the target

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_TSA: [MBARL] + 4h

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

Bit Range	Default & Access	Description
7:1	0000000b RW	**ADDR:** 7-bit address of the targeted slave
0	0b RW	**RW:** Direction of the host transfer. 1 = read, 0 = write Note: Writes to TSA values of 0xA0 0xAE are blocked depending on the setting of the SPD write disable bit in HCFG D31_F3_HostConfiguration.

33.7.5 Data 0 Register (SMB_Mem_HD0)—Offset 5h

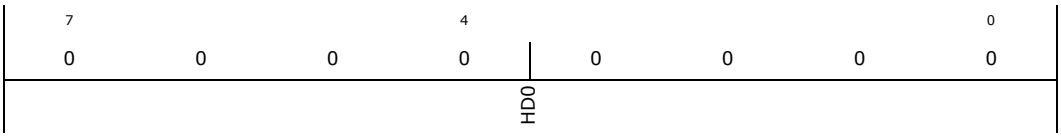
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_HD0: [MBARL] + 5h

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**HD0:** DATA0/COUNT - This field contains the eight bit data sent in the DATA0 field of the SMB protocol. For block write commands, this register reflects the number of bytes to transfer. This register should be programmed to a value between 1 and 32 for block counts. A count of 0 or a count above 32 will result in unpredictable behavior. The host controller does not check or log illegal block counts.

33.7.6 Data 1 Register (SMB_Mem_HD1)—Offset 6h

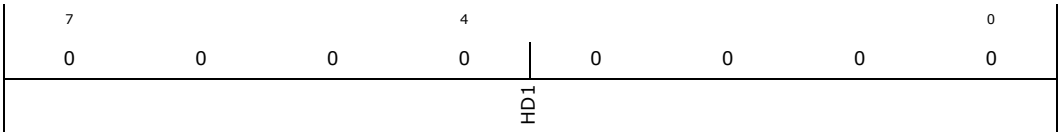
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_HD1: [MBARL] + 6h

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**HD1:** DATA1 - This eight bit register is transmitted in the DATA1 field of the SMB protocol during the execution of any command.

33.7.7 Host Block Data (SMB_Mem_HBD)—Offset 7h

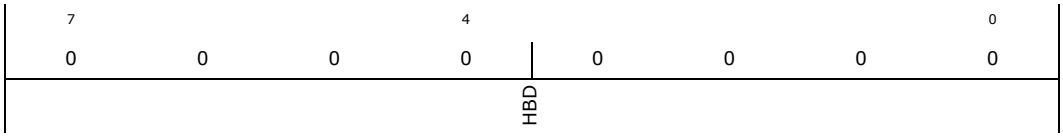
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_HBD: [MBARL] + 7h

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**HBD:** Block Data (BDTA) - This is either a register, or a pointer into a 32-byte block array, depending upon whether the E32B bit is set in the Auxiliary Control register. When the E32B bit is cleared, this is a register containing a byte of data to be sent on a block write or read from on a block read, just as it behaved on the INTEL SOC. When the E32B bit is set, reads and writes to this register are used to access the 32-byte block data storage array. An internal index pointer is used to address the array, which is reset to 0 by reading the HCTL register (offset 02h). The index pointer then increments automatically upon each access to this register. The transfer of block data into (read) or out of (write) this storage array during an SMBus transaction always starts at index address 0. When the E32B bit is set, for writes, software will write up to 32-bytes to this register as part of the setup for the command. After the Host Controller has sent the Address, Command, and Byte Count fields, it will send the bytes in the SRAM pointed to by this register. When the E32B bit is cleared for writes, software will place a single byte in this register. After the host controller has sent the address, command, and byte count fields, it will send the byte in this register. If there is more data to send, software will write the next series of bytes to the FIFO pointed to by this register and clear the DONE_STS bit. The controller will then send the next byte. During the time between the last byte being transmitted to the next byte being transmitted, the controller will insert wait-states on the interface. When the E32B bit is set for reads, after receiving the byte count into the Data0 register, the first series of data bytes go into the FIFO pointed to by this register. If the byte count has been exhausted or the 32-byte FIFO has been filled, the controller will generate an SMI or interrupt (depending on configuration) and set the DONE_STS bit. Software will then read the data. During the time between when the last byte is read from the FIFO to when the DONE_STS bit is cleared, the controller will insert wait-states on the interface.

33.7.8 Packet Error Check Data Register (SMB_Mem_PEC)—Offset 8h

This register contains the 8-bit CRC value that is used as the Packet Error Check on SMBus. For writes, this register is written by software prior to running the command. For reads, this register is read by software after the read command is completed on SMBus.

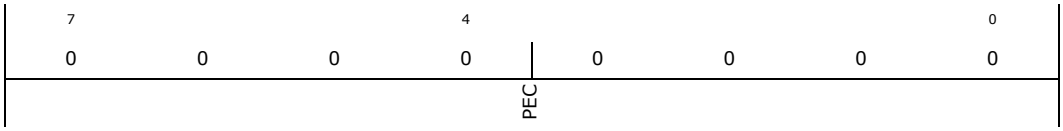
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_PEC: [MBARL] + 8h

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**PEC:** This 8-bit register is written with the SMBus PEC data prior to a write transaction. For read transactions, the PEC data is loaded from the SMBus into this register and is then read by software. Software must ensure that the IUS bit is properly maintained to avoid having this field over-written by a write transaction following a read transaction.

33.7.9 Auxiliary Status (SMB_Mem_AUXS)—Offset Ch

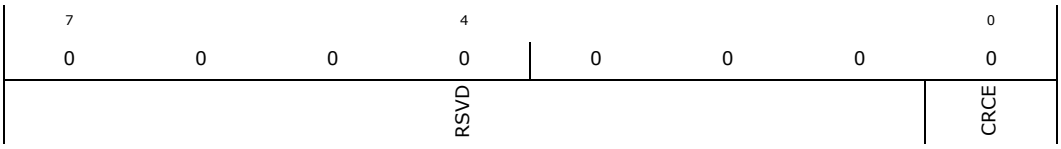
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_AUXS: [MBARL] + Ch

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:1	0000000b RO	**Reserved (RSVD):** Reserved.
0	0b RW	**CRCE:** CRC Error (CRCE) - This bit is set if a received message contained a CRC error. When this bit is set, the DEVERR bit of the host status register will also be set. This bit will be set by the controller if a software abort occurs in the middle of the CRC portion of the cycle or an abort happens after SMBus controller has received the final data bit transmitted by external slave.

33.7.10 Auxiliary Control (SMB_Mem_AUXC)—Offset Dh

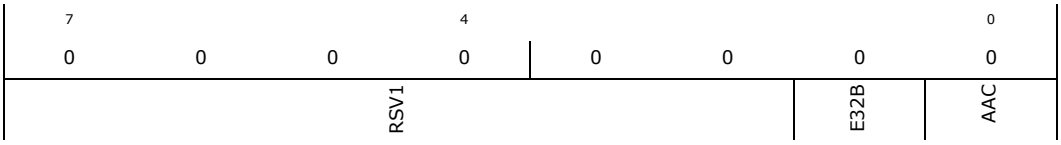
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_AUXC: [MBARL] + Dh

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:2	000000b RO	**Reserved (RSV1):** Reserved
1	0b RW	**E32B:** Enable 32-byte Buffer (E32B) - When set, the Host Block Data register is a pointer into a 32-byte buffer, as opposed to a single register. This enables the block commands to transfer or receive up to 32-bytes before the controller generates an interrupt
0	0b RW/O	**AAC:** Automatically Append CRC (AAC) - When set, the SMBus controller will automatically append the CRC. This bit must not be changed during SM Bus transactions, or undetermined behavior will result. It should be programmed only once during the lifetime of the function.

33.7.11 SMBUS_PIN_CTL Register (SMB_Mem_SMBC)—Offset Fh

Software bus accesses register

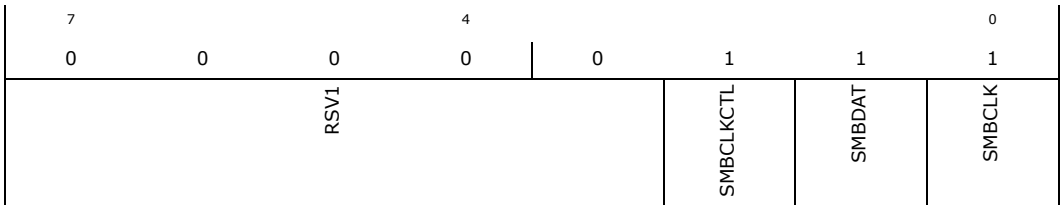
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_SMBC: [MBARL] + Fh

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 07h



Bit Range	Default & Access	Description
7:3	00000b RO	**Reserved (RSV1):** Reserved
2	1b RW	**SMBCLKCTL:** This Read/Write bit has a default of 1. 0 = SMBus controller will drive the SMB_CLK pin low, independent of what the other SMB logic would otherwise indicate for the SMB_CLK pin. 1 = The SMB_CLK pin is Not overdriven low. The other SMBus logic controls the state of the pin.
1	1b RO	**SMBDAT:** This pin returns the value on the SMB_DATA pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.
0	1b RO	**SMBCLK:** This pin returns the value on the SMB_CLK pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.

33.7.12 Slave Status Register (SMB_Mem_SSTS)—Offset 10h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally

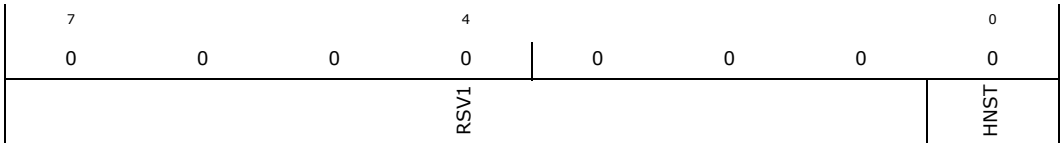
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_SSTS: [MBARL] + 10h

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:1	0000000b RO	**Reserved (RSV1):** Reserved
0	0b RW	**HNST:** HOST_NOTIFY_STS: The SMBus controller sets this bit to a 1 when it has completely received a successful Host Notify Command on the SMBus pins. Software reads this bit to determine that the source of the interrupt or SMI# was the reception of the Host Notify Command. Software clears this bit after reading any information needed from the Notify address and data registers by writing a 1 to this bit. Note that the SMBus controller will allow the Notify Address and Data registers to be over-written once this bit has been cleared. When this bit is 1, the SMBus controller will NACK the first byte (host address) of any new 'Host Notify' commands on the SMBus. Writing a 0 to this bit has no effect.

33.7.13 Slave Command Register (SMB_Mem_SCMD)—Offset 11h

All bits in this register are implemented in a slow (64khz) clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally. Also, software must confirm the prior written value before writing to the register again.

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_SCMD: [MBARL] + 11h

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
RSV1					SMBALTDIS	HNWAKEEN	HNINTREN

Bit Range	Default & Access	Description
7:3	00000b RO	**Reserved (RSV1):** Reserved
2	0b RW	**SMBALTDIS:** Software sets this bit to 1 to block the generation of the interrupt or SMI# due to the SMB_ALERTB source. This bit is logically inverted and 'AND'ed with the SMB_ALERTB bit of HSTS register. The resulting signal is distributed to the SMI# and/or interrupt generation logic.
1	0b RW	**HNWAKEEN:** Software sets this bit to 1 to enable the reception of a Host Notify command as a wake event.
0	0b RW	**HNINTREN:** Software sets this bit to 1 to enable the generation of interrupt or SMI when HOST_NOTIFY_STS is 1. This enable does not affect the setting of the HOST_NOTIFY_STS bit. When the interrupt is generated, either INTRB or SMI is generated, depending on the value of the SMI_EN bit (D31, F3, Off40h, B1). If the HOST_NOTIFY_STS bit is set when this bit is written to a 1, then the interrupt (or SMI) will be generated. The interrupt (or SMI) is logically generated by AND'ing the STS and INTREN bits.

33.7.14 Notify Device Address Register (SMB_Mem_NDA)—Offset 14h

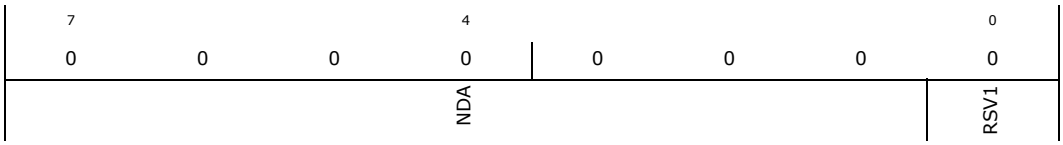
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_NDA: [MBARL] + 14h

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:1	0000000b RO	**NDA:** DEVICE_ADDRESS - This field contains the 7-bit device address received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.
0	0b RO	**Reserved (RSV1):** Reserved

33.7.15 Notify Data Low Byte Register (SMB_Mem_NDLB)—Offset 16h

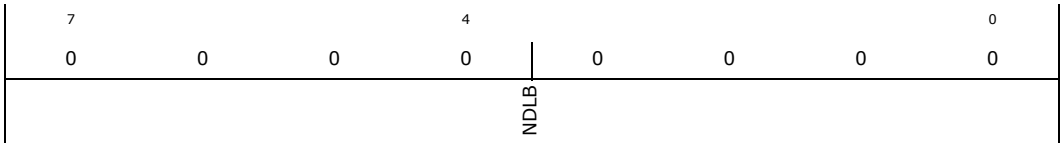
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_NDLB: [MBARL] + 16h

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RO	**NDLB:** DATA_LOW_BYTE - This field contains the first (low) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

33.7.16 Notify Data High Byte Register (SMB_Mem_NDHB)—Offset 17h

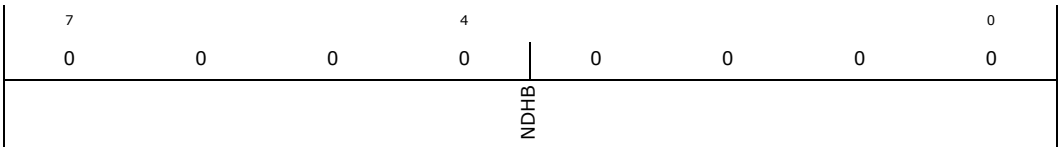
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SMB_Mem_NDHB: [MBARL] + 17h

MBARL Type: PCI Configuration Register (Size: 32 bits)
MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RO	**NDHB:** DATA_HIGH_BYTE - This field contains the second (high) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

33.8 PCU SMBUS I/O Registers

Table 318. Summary of PCU SMBUS I/O Registers—SMB_Config_IOBAR

Offset	Size	Register ID—Description	Default Value
0h	1	"Host Status Register (SMB_Mem_HSTS_io)—Offset 0h" on page 4478	00h
2h	1	"Host Control Register (SMB_Mem_HCTL_io)—Offset 2h" on page 4479	00h
3h	1	"Host Command Register (SMB_Mem_HCMD_io)—Offset 3h" on page 4482	00h
4h	1	"Transmit Slave Address Register (SMB_Mem_TSA_io)—Offset 4h" on page 4482	00h
5h	1	"Data 0 Register (SMB_Mem_HD0_io)—Offset 5h" on page 4483	00h
6h	1	"Data 1 Register (SMB_Mem_HD1_io)—Offset 6h" on page 4483	00h
7h	1	"Host Block Data (SMB_Mem_HBD_io)—Offset 7h" on page 4483	00h
8h	1	"Packet Error Check Data Register (SMB_Mem_PEC_io)—Offset 8h" on page 4484	00h
Ch	1	"Auxiliary Status (SMB_Mem_AUXS_io)—Offset Ch" on page 4485	00h
Dh	1	"Auxiliary Control (SMB_Mem_AUXC_io)—Offset Dh" on page 4485	00h
Fh	1	"SMBUS_PIN_CTL Register (SMB_Mem_SMBC_io)—Offset Fh" on page 4486	07h
10h	1	"Slave Status Register (SMB_Mem_SSTS_io)—Offset 10h" on page 4486	00h
11h	1	"Slave Command Register (SMB_Mem_SCMD_io)—Offset 11h" on page 4487	00h
14h	1	"Notify Device Address Register (SMB_Mem_NDA_io)—Offset 14h" on page 4488	00h
16h	1	"Notify Data Low Byte Register (SMB_Mem_NDLB_io)—Offset 16h" on page 4488	00h
17h	1	"Notify Data High Byte Register (SMB_Mem_NDHB_io)—Offset 17h" on page 4489	00h

33.8.1 Host Status Register (SMB_Mem_HSTS_io)—Offset 0h

All status bits are set by hardware and cleared by the software writing a one to the particular bit position. Writing a zero to any bit position has no affect

Access Method

Type: I/O Register (Size: 8 bits)

SMB_Mem_HSTS_io: [IOBAR] + 0h

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
BDS	IUS	SMB_ALERTB	FAILED	BERR	DEVERR	INTR	HBSY

Bit Range	Default & Access	Description
7	0b RW	**BDS:** BYTE_DONE_STS (BDS) - This bit will be set to 1 when the host controller has received a byte (for Block Read commands) or if it has completed transmission of a byte (for Block Write commands) when the 32-byte buffer is not being used. Note that this bit will be set, even on the last byte of the transfer. Software clears the bit by writing a 1 to the bit position. This bit has no meaning for block transfers when the 32-byte buffer is enabled.**Note: When the last byte of a block message is received, the host controller will set this bit. However, it will not immediately set the INTR bit (bit 1 in this register). When the interrupt handler clears the BYTE_DONE_STS bit, the message is considered complete, and the host controller will then set the INTR bit (and generate another interrupt). Thus, for a block message of n bytes, the SMBus host will generate n+1 interrupts. The interrupt handler needs to be implemented to handle these cases.**
6	0b RW	**IUS:** In Use Status (IUS) - After a full PCI reset, a read to this bit returns a 0. After the first read, subsequent reads will return a 1. A write of a 1 to this bit will reset the next read value to 0. Writing a 0 to this bit has no effect. Software can poll this bit until it reads a 0, and will then own the usage of the host controller. This bit has no other effect on the hardware, and is only used as semaphore among various independent software threads that may need to use the SMBus host
5	0b RW	**SMB_ALERTB:** the SOC sets this bit to a '1' to indicates source of the interrupt or SMI# was the SMB_ALERTB signal. Software resets this bit by writing a 1 to this location.
4	0b RW	**FAILED:** Failed (FAIL) - When set, this indicates that the source of the interrupt or SMI was a failed bus transaction. This is set in response to the KILL bit being set to terminate the host transaction.
3	0b RW	**BERR:** Bus Error (BERR) - When set, this indicates the source of the interrupt or SMI was a transaction collision.
2	0b RW	**DEVERR:** Device Error (DERR) - When set, this indicates that the source of the interrupt or SMI was due one of the following: Illegal Command Field Unclaimed Cycle (host initiated) Host Device Time-out Error. CRC Error Write Protection Access Error (START bit will be cleared, Device Error will be set and Host Busy is never set because SMB Transaction never took place).
1	0b RW	**INTR:** Interrupt (INTR) - When set, this indicates that the source of the interrupt or SMI was the successful completion of its last command.
0	0b RW	**HBSY:** Host Busy (HBSY) - A '1' indicates that the SMBus host is running a command from the host interface. No SMB registers should be accessed while this bit is set. Exception: The BLOCK DATA REGISTER can be accessed when this bit is set ONLY when the SMB_CMD bits (in Host control register) are programmed for Block command or I2C Read command. This is necessary in order to check the DONE_STS bit.

33.8.2 Host Control Register (SMB_Mem_HCTL_io)—Offset 2h

Host Control Register

Note: A read to this register will clear the pointer in the 32-byte buffer.

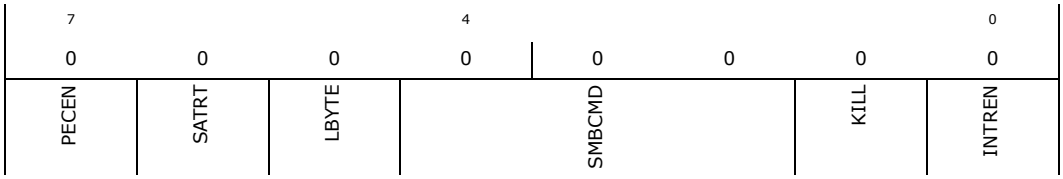
Access Method

Type: I/O Register (Size: 8 bits)

SMB_Mem_HCTL_io: [IOBAR] + 2h

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h



Bit Range	Default & Access	Description
7	0b RW	**PECEN:** PEC_EN: When set to '1', this bit causes the host controller to perform the SMBus transaction with the Packet Error Checking phase appended. For writes, the value of the PEC byte is transferred from the PEC Register. For reads, the PEC byte is loaded in to the PEC Register. When this bit is cleared to '0', the SMBus host controller does not perform the transaction with the PEC phase appended. This bit must be written prior to the write in which the START bit is set.
6	0b WO	**START (SATRT):** START: This write-only bit is used to initiate the command described in the SMB_CMD field. All registers should be setup prior to writing a '1' to this bit position. This bit always reads zero. The HOST_BUSY bit in the Host Status register (offset 00h) can be used to identify when the SMBus controller has finished the command.
5	0b RW	**LBYTE:** LAST_BYTE: Used for I2C Read commands as an indication that the next byte will be the last one to be received for that block. The algorithm and usage model for this bit will be as follows (assume a message of n bytes): A. When the software sees the BYTE_DONE_STS bit set (bit 7 in the SMBus Host Status Register) for each of bytes 1 through n-2 of the message, the software should then read the Block Data Byte Register to get the byte that was just received. B. After reading each of bytes 1 to n-2 of the message, the software will then clear the BYTE_DONE_STS bit. C. After receiving byte n-1 of the message, the software will then set the 'LAST BYTE' bit. The software will then clear the BYTE_DONE_STS bit. D. The Intel PCH will then receive the last byte of the message (byte n). However, the Intel PCH state machine will see the LAST BYTE bit set, and instead of sending an ACK after receiving the last byte, it will instead send a NAK. E. After receiving the last byte (byte n), the software will still clear the BYTE_DONE_STS bit. However, the LAST_BYTE bit will be irrelevant at that point. Note: This bit may be set when the TCO timer causes the SECOND_TO_STS bit to be set. See the TCO2_STS Register in Volume 1, bit 1 for more details on that bit. The SMBus device driver should clear the LAST_BYTE bit (if it is set) before starting any new command. Note: In addition to I2C Read Commands, the LAST_BYTE bit will also cause Block Read/Write cycles to stop prematurely (at the end of the next byte).

Bit Range	Default & Access	Description
4:2	000b RW	**SMBCMD:** SMB_CMD - As shown by the bit encoding below, indicates which command the SMBus host is to perform. If enabled, the SMBus host will generate an interrupt or SMI when the command has completed If the value is for a non-supported or reserved command, the SMBus host will set the device error (DEV_ERR) status bit and generate an interrupt when the START bit is set. The SMBus controller will perform no command, and will not operate until DEV_ERR is cleared.***3'b000 - Quick*** The slave address and read/write value (bit 0) are stored in the tx slave address register ***3'b001 - Byte*** This command uses the transmit slave address and command registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 register will contain the read data. ***3'b010 - Byte Data*** This command uses the transmit slave address, command, and DATA0 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, the DATA0 register will contain the read data ***3'b011 - Word Data*** This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 and DATA1 registers will contain the read data. ***3'b100 - Process Call*** This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. After the command completes, the DATA0 and DATA1 registers will contain the read data. ***3'b101 - Block*** This command uses the transmit slave address, command, and DATA0 registers, and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block reads, the count is received and stored in the DATA0 register. Bit 0 of the slave address register selects if this is a read or write command. For writes, data is retrieved from the first n (where n is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. ***3'b110 - I2C Read*** This command uses the transmit slave address, command, DATA0, DATA1 registers, and the Block Data Byte register. The read data is stored in the Block Data Byte register. The Intel PCH will continue reading data until the NAK is received. ***3'b111 - Block Process*** This command uses the transmit slave address, command, DATA0 and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block read, the count is received and stored in the DATA0 register. Bit 0 of the slave address register always indicate a write command. For writes, data is retrieved from the first m (where m is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. **Note: E32B bit in the Auxiliary Control Register must be set for this command to work.**
1	0b RW	**KILL:** KILL - When set, kills the current host transaction taking place, sets the FAILED status bit, and asserts the interrupt (or SMI) selected by the SMB_INTRSEL field. This bit, once set, must be cleared to allow the SMB Host Controller to function normally
0	0b RW	**INTREN:** Enable the generation of an interrupt or SMI upon the completion of the command. Enables also other interrupt sendings , like ALERT and HOST_NOTIFY

33.8.3 Host Command Register (SMB_Mem_HCMD_io)—Offset 3h

This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command.

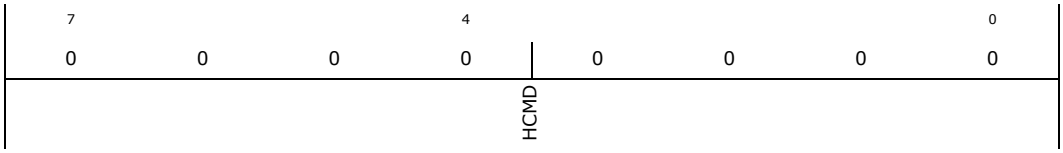
Access Method

Type: I/O Register (Size: 8 bits)

SMB_Mem_HCMD_io: [IOBAR] + 3h

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**HCMD:** Command to be transmitted

33.8.4 Transmit Slave Address Register (SMB_Mem_TSA_io)—Offset 4h

This register is transmitted by the host controller in the slave address field of the SMB protocol. This is the address of the target

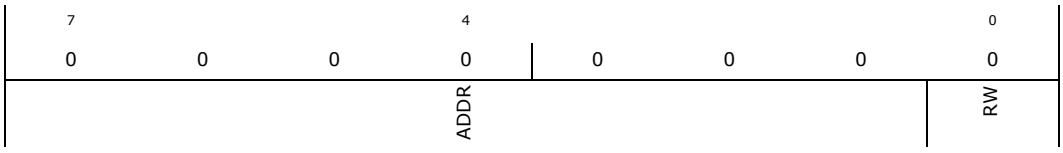
Access Method

Type: I/O Register (Size: 8 bits)

SMB_Mem_TSA_io: [IOBAR] + 4h

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h



Bit Range	Default & Access	Description
7:1	0000000b RW	**ADDR:** 7-bit address of the targeted slave
0	0b RW	**RW:** Direction of the host transfer. 1 = read, 0 = write Note: Writes to TSA values of 0xA0 0xAE are blocked depending on the setting of the SPD write disable bit in HCFG D31_F3_HostConfiguration.

33.8.5 Data 0 Register (SMB_Mem_HD0_io)—Offset 5h

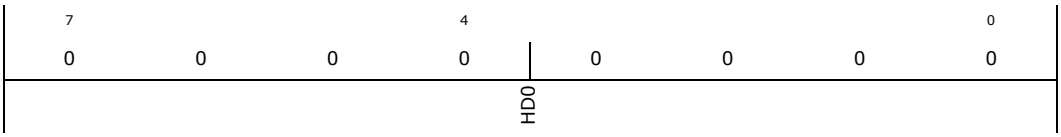
Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_HD0_io: [IOBAR] + 5h

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**HD0:** DATA0/COUNT - This field contains the eight bit data sent in the DATA0 field of the SMB protocol. For block write commands, this register reflects the number of bytes to transfer. This register should be programmed to a value between 1 and 32 for block counts. A count of 0 or a count above 32 will result in unpredictable behavior. The host controller does not check or log illegal block counts.

33.8.6 Data 1 Register (SMB_Mem_HD1_io)—Offset 6h

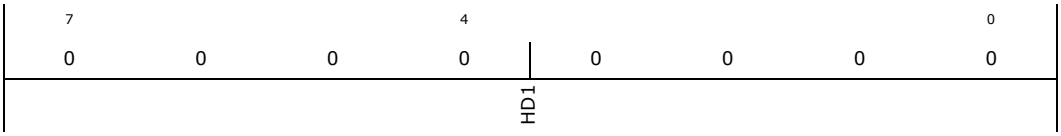
Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_HD1_io: [IOBAR] + 6h

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**HD1:** DATA1 - This eight bit register is transmitted in the DATA1 field of the SMB protocol during the execution of any command.

33.8.7 Host Block Data (SMB_Mem_HBD_io)—Offset 7h

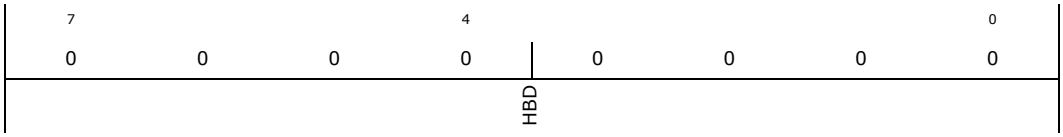
Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_HBD_io: [IOBAR] + 7h

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**HBD:** Block Data (BDTA) - This is either a register, or a pointer into a 32-byte block array, depending upon whether the E32B bit is set in the Auxiliary Control register. When the E32B bit is cleared, this is a register containing a byte of data to be sent on a block write or read from on a block read, just as it behaved on the INTEL SOC. When the E32B bit is set, reads and writes to this register are used to access the 32-byte block data storage array. An internal index pointer is used to address the array, which is reset to 0 by reading the HCTL register (offset 02h). The index pointer then increments automatically upon each access to this register. The transfer of block data into (read) or out of (write) this storage array during an SMBus transaction always starts at index address 0. When the E32B bit is set, for writes, software will write up to 32-bytes to this register as part of the setup for the command. After the Host Controller has sent the Address, Command, and Byte Count fields, it will send the bytes in the SRAM pointed to by this register. When the E32B bit is cleared for writes, software will place a single byte in this register. After the host controller has sent the address, command, and byte count fields, it will send the byte in this register. If there is more data to send, software will write the next series of bytes to the FIFO pointed to by this register and clear the DONE_STS bit. The controller will then send the next byte. During the time between the last byte being transmitted to the next byte being transmitted, the controller will insert wait-states on the interface. When the E32B bit is set for reads, after receiving the byte count into the Data0 register, the first series of data bytes go into the FIFO pointed to by this register. If the byte count has been exhausted or the 32-byte FIFO has been filled, the controller will generate an SMI or interrupt (depending on configuration) and set the DONE_STS bit. Software will then read the data. During the time between when the last byte is read from the FIFO to when the DONE_STS bit is cleared, the controller will insert wait-states on the interface.

33.8.8 Packet Error Check Data Register (SMB_Mem_PEC_io)—Offset 8h

This register contains the 8-bit CRC value that is used as the Packet Error Check on SMBus. For writes, this register is written by software prior to running the command. For reads, this register is read by software after the read command is completed on SMBus.

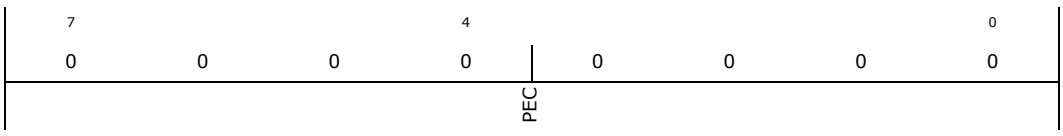
Access Method

Type: I/O Register (Size: 8 bits)

SMB_Mem_PEC_io: [IOBAR] + 8h

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**PEC:** This 8-bit register is written with the SMBus PEC data prior to a write transaction. For read transactions, the PEC data is loaded from the SMBus into this register and is then read by software. Software must ensure that the IUS bit is properly maintained to avoid having this field over-written by a write transaction following a read transaction.

33.8.9 Auxiliary Status (SMB_Mem_AUXS_io)—Offset Ch

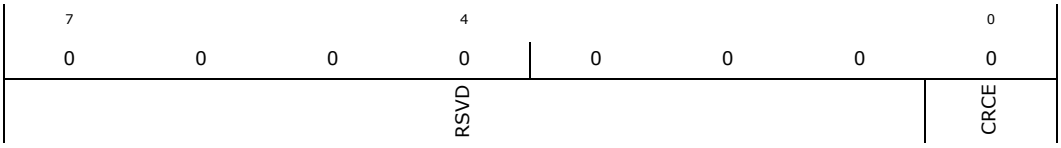
Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_AUXS_io: [IOBAR] + Ch

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h



Bit Range	Default & Access	Description
7:1	0000000b RO	**Reserved (RSVD):** Reserved.
0	0b RW	**CRCE:** CRC Error (CRCE) - This bit is set if a received message contained a CRC error. When this bit is set, the DEVERR bit of the host status register will also be set. This bit will be set by the controller if a software abort occurs in the middle of the CRC portion of the cycle or an abort happens after SMBus controller has received the final data bit transmitted by external slave.

33.8.10 Auxiliary Control (SMB_Mem_AUXC_io)—Offset Dh

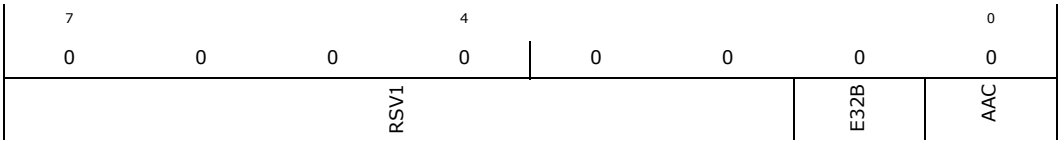
Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_AUXC_io: [IOBAR] + Dh

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h



Bit Range	Default & Access	Description
7:2	000000b RO	**Reserved (RSV1):** Reserved
1	0b RW	**E32B:** Enable 32-byte Buffer (E32B) - When set, the Host Block Data register is a pointer into a 32-byte buffer, as opposed to a single register. This enables the block commands to transfer or receive up to 32-bytes before the controller generates an interrupt
0	0b RW/O	**AAC:** Automatically Append CRC (AAC) - When set, the SMBus controller will automatically append the CRC. This bit must not be changed during SM Bus transactions, or undetermined behavior will result. It should be programmed only once during the lifetime of the function.

33.8.11 SMBUS_PIN_CTL Register (SMB_Mem_SMBC_io)—Offset Fh

Software bus accesses register

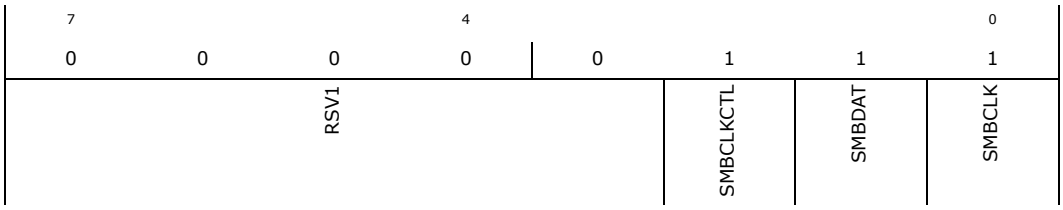
Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_SMBC_io: [IOBAR] + Fh

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 07h



Bit Range	Default & Access	Description
7:3	00000b RO	**Reserved (RSV1):** Reserved
2	1b RW	**SMBCLKCTL:** This Read/Write bit has a default of 1. 0 = SMBus controller will drive the SMB_CLK pin low, independent of what the other SMB logic would otherwise indicate for the SMB_CLK pin. 1 = The SMB_CLK pin is Not overdriven low. The other SMBus logic controls the state of the pin.
1	1b RO	**SMBDAT:** This pin returns the value on the SMB_DATA pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.
0	1b RO	**SMBCLK:** This pin returns the value on the SMB_CLK pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.

33.8.12 Slave Status Register (SMB_Mem_SSTS_io)—Offset 10h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally

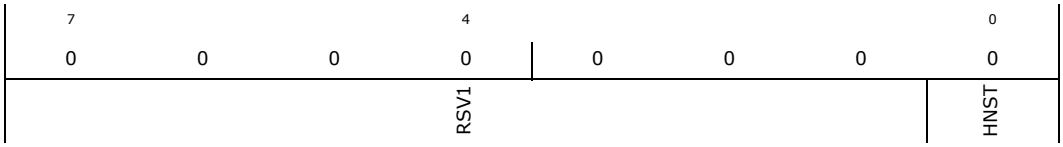
Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_SSTS_io: [IOBAR] + 10h

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h



Bit Range	Default & Access	Description
7:1	0000000b RO	**Reserved (RSV1):** Reserved
0	0b RW	**HNST:** HOST_NOTIFY_STS: The SMBus controller sets this bit to a 1 when it has completely received a successful Host Notify Command on the SMBus pins. Software reads this bit to determine that the source of the interrupt or SMI# was the reception of the Host Notify Command. Software clears this bit after reading any information needed from the Notify address and data registers by writing a 1 to this bit. Note that the SMBus controller will allow the Notify Address and Data registers to be over-written once this bit has been cleared. When this bit is 1, the SMBus controller will NACK the first byte (host address) of any new 'Host Notify' commands on the SMBus. Writing a 0 to this bit has no effect.

33.8.13 Slave Command Register (SMB_Mem_SCMD_io)—Offset 11h

All bits in this register are implemented in a slow (64khz) clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally. Also, software must confirm the prior written value before writing to the register again.

Access Method

Type: I/O Register (Size: 8 bits)

SMB_Mem_SCMD_io: [IOBAR] + 11h

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
RSV1					SMBALTDIS	HNWAKEEN	HNINTREN

Bit Range	Default & Access	Description
7:3	00000b RO	**Reserved (RSV1):** Reserved
2	0b RW	**SMBALTDIS:** Software sets this bit to 1 to block the generation of the interrupt or SMI# due to the SMB_ALERTB source. This bit is logically inverted and 'AND'ed with the SMB_ALERTB bit of HSTS register. The resulting signal is distributed to the SMI# and/or interrupt generation logic.
1	0b RW	**HNWAKEEN:** Software sets this bit to 1 to enable the reception of a Host Notify command as a wake event.
0	0b RW	**HNINTREN:** Software sets this bit to 1 to enable the generation of interrupt or SMI when HOST_NOTIFY_STS is 1. This enable does not affect the setting of the HOST_NOTIFY_STS bit. When the interrupt is generated, either INTRB or SMI is generated, depending on the value of the SMI_EN bit (D31, F3, Off40h, B1). If the HOST_NOTIFY_STS bit is set when this bit is written to a 1, then the interrupt (or SMI) will be generated. The interrupt (or SMI) is logically generated by AND'ing the STS and INTREN bits.

33.8.14 Notify Device Address Register (SMB_Mem_NDA_io)—Offset 14h

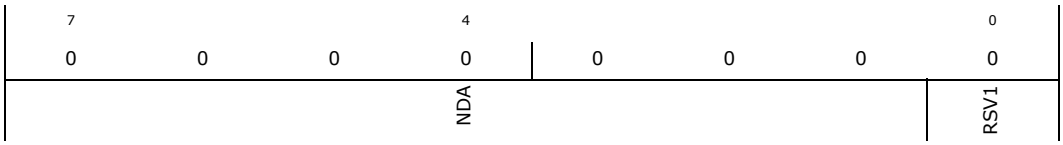
Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_NDA_io: [IOBAR] + 14h

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h



Bit Range	Default & Access	Description
7:1	0000000b RO	**NDA:** DEVICE_ADDRESS - This field contains the 7-bit device address received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.
0	0b RO	**Reserved (RSV1):** Reserved

33.8.15 Notify Data Low Byte Register (SMB_Mem_NDLB_io)—Offset 16h

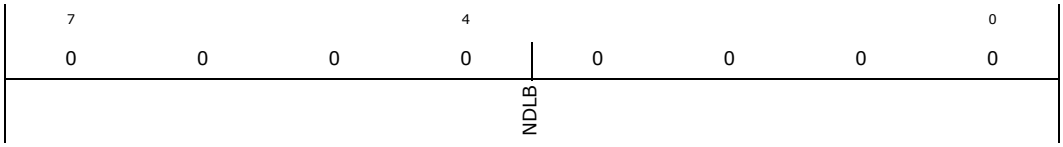
Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_NDLB_io: [IOBAR] + 16h

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RO	**NDLB:** DATA_LOW_BYTE - This field contains the first (low) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

33.8.16 Notify Data High Byte Register (SMB_Mem_NDHB_io)—Offset 17h

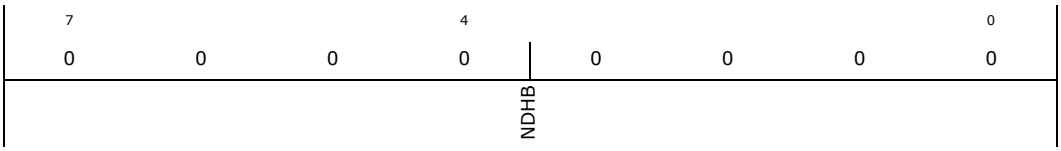
Access Method

Type: I/O Register (Size: 8 bits)

SMB_Mem_NDHB_io: [IOBAR] + 17h

IOBAR Type: PCI Configuration Register (Size: 32 bits)
IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h



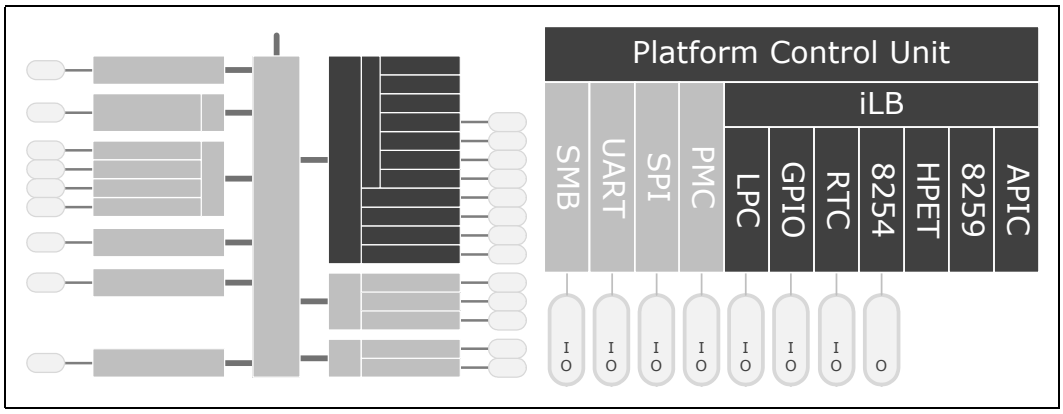
Bit Range	Default & Access	Description
7:0	00h RO	**NDHB:** DATA_HIGH_BYTE - This field contains the second (high) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

34 PCU – Intel® Legacy Block (iLB) Overview

The Intel Legacy Block (iLB) is a collection of disparate functional blocks that are critical for implementing the legacy PC platform features. These blocks include:

- PCU – iLB – Low Pin Count (LPC) Bridge
- PCU – iLB – Real Time Clock (RTC)
- PCU – iLB – 8254 Timers
- PCU – iLB – High Precision Event Timer (HPET)
- PCU – iLB – GPIO
- PCU – iLB – IO APIC
- PCU – iLB – 8259 Programmable Interrupt Controllers (PIC)

The iLB also implements a register range for configuration of some of those blocks along with support for Non-Maskable Interrupts (NMI).



34.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details as well as the subsequent sections.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

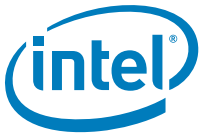


Table 319. iLB Signals

Signal Name	Direction Plat. Power	Description
ILB_NMI	I V1P8S	Non-Maskable Interrupt: This is an NMI event indication into the SoC. *This signal is muxed and may be used by other functions.*

34.2 Features

34.2.1 Key Features

The key features of various blocks are as follows:

- Subtractive agent for the PCU
- LPC Interface
  - Supports Low Pin Count (LPC) 1.1 Specification
  - No support for DMA or bus mastering
  - Supports Trusted Platform Module (TPM) 1.2 and 2.0
  - Subtractive agent for the Intel Legacy Block
- General Purpose Input Output
  - Control interface for SoC GPIOs
  - I/O mapped registers
- 8259 Programmable Interrupt Controller
  - Legacy interrupt support
  - 15 total interrupts through two cascaded controllers
  - I/O and Memory mapped registers
- I/O Advanced Programmable Interrupt Controller
  - Legacy-free interrupt support
  - 87 total interrupts
  - Memory mapped registers
- 8254
  - Legacy timer support
  - Three timers with fixed uses: System Timer, Refresh Request Signal and Speaker Tone
  - I/O mapped registers
- HPET - High Performance Event Timers
  - Legacy-free timer support

  - Three timers and one counter
  - Memory mapped registers
- Real-Time Clock (RTC)
  - 242 byte RAM backed by battery (aka CMOS RAM)
  - Can generate wake/interrupt when time matches programmed value
  - I/O and indexed registers

34.2.2 Non-Maskable Interrupt

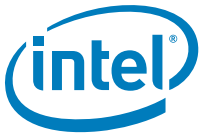
NMI support is enabled by setting the NMI Enable (NMI_EN) bit, at IO Port 70h, Bit 7, to 0b.

Non-Maskable Interrupts (NMIs) can be generated by several sources, as described in Table 320.

Table 320. NMI Sources

NMI Source	NMI Source Enabler/ Disabler	NMI Source Status	Alternate Configuration
SERR# goes active **NOTE:** A SERR# is only generated internally in the SoC)	NSC.SNE	NSC.SNS	All NMI sources may, alternatively, generate a SMI by setting GNMI.NMI2SMIEN=1b The SoC uses GNMI.NMI2SMIST for observing SMI status
IOCHK# goes active **NOTE:** A IOCHK# is only generated as a SERIRQ# frame	NSC.INE	NSC.INS	
ILB_NMI goes active **NOTE:** Active can be defined as being on the positive or negative edge of the signal using the GNMI.GNMIED register bit.	GNMI.GNMIED	GNMI.GNMIS	
Software sets the GNMI.NMIN register bit	GNMI.NMIN	GNMI.NMINS	

§



34.3 PCU iLB Interrupt Decode and Route

34.3.1 ACTL—Offset 0h

ACPI Control

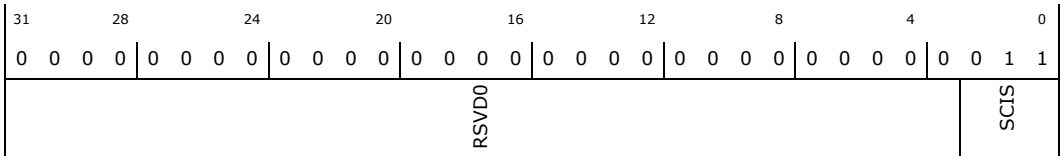
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ACTL: [ILB_BASE_ADDRESS] + 0h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000003h



Bit Range	Default & Access	Description
31:3	0b RO	**RSVD0:** Reserved

Bit Range	Default & Access	Description
2:0	011b RW	**SCIS:** SCI IRQ Select (SCIS): Specifies on which IRQ SCI will rout to. If not using APIC, SCI must be routed to IRQ9-11 , and that interrupt is not sharable with SERIRQ, but is shareable with other interrupts. If using APIC, SCI can be mapped to IRQ20-23, and can be shared with other interrupts. When the interrupt is mapped to APIC interrupts 9, 10 or 11, APIC must be programmed for active-high reception. When the interrupt is mapped to APIC interrupts 20 through 23, APIC must be programmed for active-low reception.

34.3.2 MC—Offset 4h

Miscellaneous Control

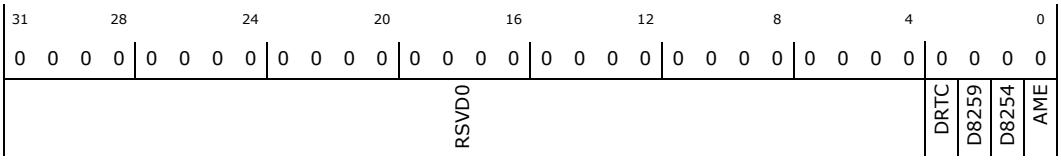
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

MC: [ILB_BASE_ADDRESS] + 4h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0b RO	**RSVD0:** Reserved
3	0b RW	**DRTC:** Disable RTC (DRTC): When set, decodes to the RTC will be disabled, and the accesses instead will be sent to LPC. This allows testing to determine whether these functions are needed for XP and Vista 'EDS Note: Do not include this field in the EDS.
2	0b RW	**D8259:** Disable 8259 (D8259): When set, decodes to the 8259 will be disabled, and the accesses instead will be sent to LPC. This allows testing to determine whether these functions are needed for XP and Vista 'EDS Note: Do not include this field in the EDS.
1	0b RW	**D8254:** Disable 8254 (D8254): When set, decodes to the 8254 will be disabled, and the accesses instead will be sent to LPC. This allows testing to determine whether these functions are needed for XP and Vista 'EDS Note: Do not include this field in the EDS.
0	0b RW	**AME:** Alt Access Mode is a mode that enables host reading some WO registers . 1. Read 8254 (legacy timers) indirect WO registers 2. Read 8259 (legacy interrupt controller) indirect WO registers 3. Read port 0x70 - port 0x70 includes the RTC memory address [6:0] and the NMI enable bit [7]

34.3.3 PIRQA—Offset 8h

PIRQA Routing Control

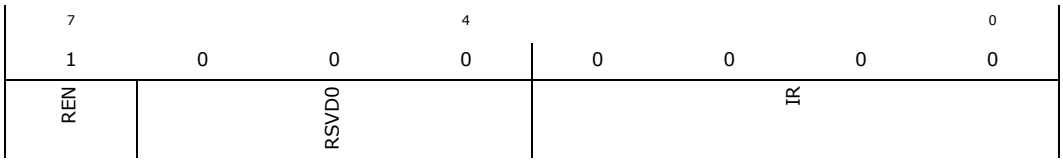
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

PIRQA: [ILB_BASE_ADDRESS] + 8h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 80h



Bit Range	Default & Access	Description
7	1b RW	**REN:** Interrupt Routing Enable (REN): When cleared, the corresponding PIRQx is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQx is not routed to the 8259.
6:4	0b RO	**RSVD0:** Reserved
3:0	0b RW	**IR:** IRQ Routing (IR): Indicates how to route PIRQx Bits Mapping Bits Mapping 0h Reserved 8h Reserved 1h Reserved 9h IRQ9 2h Reserved Ah IRQ10 3h IRQ3 Bh IRQ11 4h IRQ4 Ch IRQ12 5h IRQ5 Dh Reserved 6h IRQ6 Eh IRQ14 7h IRQ7 Fh IRQ15

34.3.4 PIRQB—Offset 9h

PIRQB Routing Control

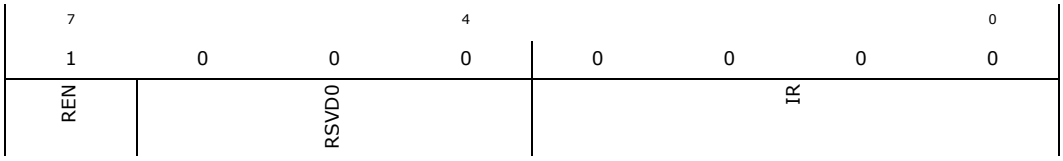
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

PIRQB: [ILB_BASE_ADDRESS] + 9h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 80h



Bit Range	Default & Access	Description
7	1b RW	**REN:** Interrupt Routing Enable (REN): When cleared, the corresponding PIRQx is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQx is not routed to the 8259.

34.3.7 PIRQE—Offset Ch

PIRQE Routing Control

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

PIRQE: [ILB_BASE_ADDRESS] + Ch

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 80h

7			4				0
1	0	0	0	0	0	0	0
REN	RSVD0			IR			

Bit Range	Default & Access	Description
7	1b RW	**REN:** Interrupt Routing Enable (REN): When cleared, the corresponding PIRQx is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQx is not routed to the 8259.
6:4	0b RO	**RSVD0:** Reserved
3:0	0b RW	**IR:** IRQ Routing (IR): Indicates how to route PIRQx Bits Mapping Bits Mapping 0h Reserved 8h Reserved 1h Reserved 9h IRQ9 2h Reserved Ah IRQ10 3h IRQ3 Bh IRQ11 4h IRQ4 Ch IRQ12 5h IRQ5 Dh Reserved 6h IRQ6 Eh IRQ14 7h IRQ7 Fh IRQ15

34.3.8 PIRQF—Offset Dh

PIRQF Routing Control

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

PIRQF: [ILB_BASE_ADDRESS] + Dh

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 80h

7			4				0
1	0	0	0	0	0	0	0

34.3.11 SCNT—Offset 10h

SCNT - Serial IRQ Control

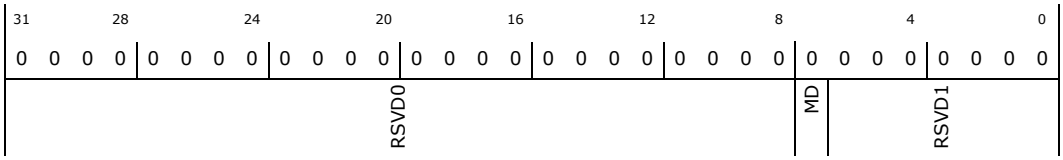
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

SCNT: [ILB_BASE_ADDRESS] + 10h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	0b RO	**RSVD0:** Reserved
7	0b RW	**MD:** Mode (MD): When set, the SERIRQ is in continuous mode. When cleared, SERIRQ is in quiet mode. This bit must be set to guarantee that the first action of SERIRQ is a start frame.
6:0	0b RO	**RSVD1:** Reserved

34.3.12 KMC—Offset 14h

USB Legacy Keyboard/Mouse Control

Access Method

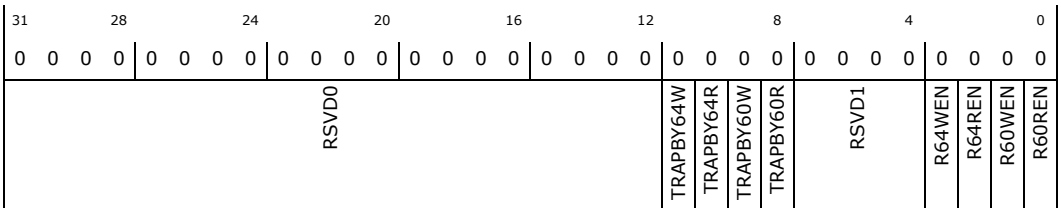
Type: Memory Mapped I/O Register (Size: 32 bits)

KMC: [ILB_BASE_ADDRESS] + 14h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0b RO	**RSVD0:** Reserved
11	0b RW/1C	**TRAPBY64W:** TRAPBY64W - SMI Caused by Port 64 Write: Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 3, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
10	0b RW/1C	**TRAPBY64R:** TRAPBY64R - SMI Caused by Port 64 Read: Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 2, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
9	0b RW/1C	**TRAPBY60W:** TRAPBY60W - SMI Caused by Port 60 Write: Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 1, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
8	0b RW/1C	**TRAPBY60R:** TRAPBY60R - SMI Caused by Port 60 Read: Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 0, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
7:4	0b RO	**RSVD1:** Reserved
3	0b RW	**R64WEN:** R64WEN - SMI on Port 64 Writes Enable: When set, a 1 in bit 11 will cause an SMI event.
2	0b RW	**R64REN:** R64REN - SMI on Port 64 Reads Enable: When set, a 1 in bit 10 will cause an SMI event.
1	0b RW	**R60WEN:** R60WEN - SMI on Port 60 Writes Enable: When set, a 1 in bit 9 will cause an SMI event.
0	0b RW	**R60REN:** R60REN - SMI on Port 60 Reads Enable: When set, a 1 in bit 8 will cause an SMI event.

34.3.13 FS—Offset 18h

FS - FWH ID Select

Access Method

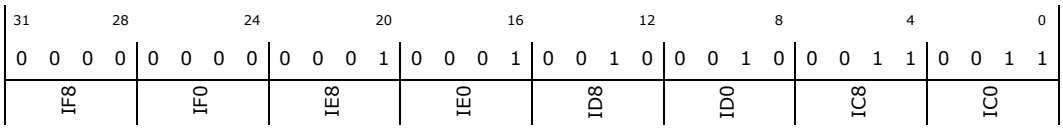
Type: Memory Mapped I/O Register (Size: 32 bits)

FS: [ILB_BASE_ADDRESS] + 18h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00112233h



Bit Range	Default & Access	Description
31:28	0h RO	**IF8:** F8-FF IDSEL (IF8): IDSEL to use in FWH cycle for range enabled by BDE.EF8. The Address ranges are: FFF80000h - FFFFFFFFh, FFB80000h - FFBFFFFFh and 000E0000h - 000FFFFFh
27:24	0h RW	**IF0:** F0-F7 IDSEL (IF0): IDSEL to use in FWH cycle for range enabled by BDE.EF0. The Address ranges are: FFF00000h - FFF7FFFFh, FFB00000h - FFB7FFFFh
23:20	1h RW	**IE8:** E8-EF IDSEL (IE8): IDSEL to use in FWH cycle for range enabled by BDE.EE8. The Address ranges are: FFE80000h - FFEFFFFFh, FFA80000h - FFAFFFFFh
19:16	1h RW	**IE0:** E0-E7 IDSEL (IE0): IDSEL to use in FWH cycle for range enabled by BDE.EE0. The Address ranges are: FFE00000h - FFE7FFFFh, FFA00000h - FFA7FFFFh
15:12	2h RW	**ID8:** D8-DF IDSEL (ID8): IDSEL to use in FWH cycle for range enabled by BDE.ED8. The Address ranges are: FFD80000h - FFDFFFFFh, FF980000h - FF9FFFFFh
11:8	2h RW	**ID0:** D0-D7 IDSEL (ID0): IDSEL to use in FWH cycle for range enabled by BDE.ED0. The Address ranges are: FFD00000h - FFD7FFFFh, FF900000h - FF97FFFFh
7:4	3h RW	**IC8:** C8-CF IDSEL (IC8): IDSEL to use in FWH cycle for range enabled by BDE.EC8. The Address ranges are: FFC80000h - FFCFFFFFh, FF880000h - FF8FFFFFh
3:0	3h RW	**IC0:** C0-C7 IDSEL (IC0): IDSEL to use in FWH cycle for range enabled by BDE.EC0. The Address ranges are: FFC00000h - FFC7FFFFh, FF800000h - FF87FFFFh

34.3.14 BC—Offset 1Ch

BC - BIOS Control

Access Method

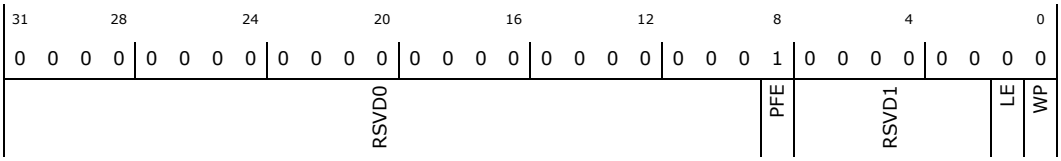
Type: Memory Mapped I/O Register (Size: 32 bits)

BC: [ILB_BASE_ADDRESS] + 1Ch

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000100h



Bit Range	Default & Access	Description
31:9	0b RO	**RSVD0:** Reserved
8	1b RW	**PFE:** Prefetch Enable (PFE): When set, BIOS prefetching is enabled. An access to BIOS causes a 64-byte fetch of the line starting at that region. Subsequent accesses within that region result in data being returned from the prefetch buffer. The prefetch buffer is invalidated when this bit is cleared, or a BIOS access occurs to a different line than what is currently in the buffer.
7:2	0b RO	**RSVD1:** Reserved
1	0b RW	**LE:** Lock Enable (LE): When set, setting the WP bit will cause SMIs. When cleared, setting the WP bit will not cause SMIs. Once set, this bit can only be cleared by a PMU_PLTRST_B#.
0	0b RW	**WP:** Write Protect (WP): When set, access to BIOS is enabled for both read and write cycles. When cleared, only read cycles are permitted to BIOS. When written from a 0 to a 1 and LE is also set, an SMI# is generated. This ensures that only SMM code can update BIOS.

34.3.15 IR0—Offset 20h

IR0 - Interrupt Routing Device 0

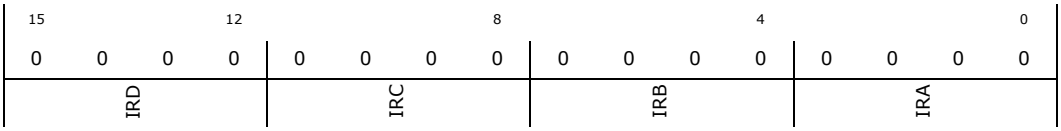
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

IR0: [ILB_BASE_ADDRESS] + 20h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 0000h



Bit Range	Default & Access	Description
15:12	4'd3 RW	**IRD:** INTD mapping to IRQ A-H
11:8	4'd2 RW	**IRC:** INTC mapping to IRQ A-H
7:4	4'd1 RW	**IRB:** INTB mapping to IRQ A-H
3:0	4'd0 RW	**IRA:** INTA mapping to IRQ A-H

34.3.16 IR1—Offset 22h

IR1 - Interrupt Routing Device 1

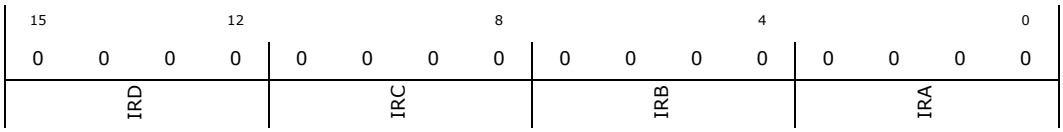
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

IR1: [ILB_BASE_ADDRESS] + 22h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 0000h



Bit Range	Default & Access	Description
15:12	4'd3 RW	**IRD:** INTD mapping to IRQ A-H
11:8	4'd2 RW	**IRC:** INTC mapping to IRQ A-H
7:4	4'd1 RW	**IRB:** INTB mapping to IRQ A-H
3:0	4'd0 RW	**IRA:** INTA mapping to IRQ A-H

34.3.17 IR2—Offset 24h

IR2 - Interrupt Routing Device 2

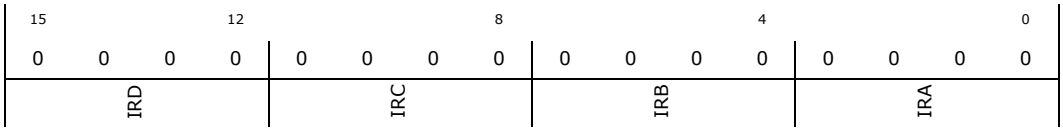
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

IR2: [ILB_BASE_ADDRESS] + 24h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 0000h



Bit Range	Default & Access	Description
15:12	4'd3 RW	**IRD:** INTD mapping to IRQ A-H
11:8	4'd2 RW	**IRC:** INTC mapping to IRQ A-H

Bit Range	Default & Access	Description
7:4	4'd1 RW	**IRB:** INTB mapping to IRQ A-H
3:0	4'd0 RW	**IRA:** INTA mapping to IRQ A-H

34.3.18 IR3—Offset 26h

IR3 - Interrupt Routing Device 3

Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

IR3: [ILB_BASE_ADDRESS] + 26h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 0000h

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

34.3.47 OIC—Offset 60h

Other Interrupt Control

Access Method

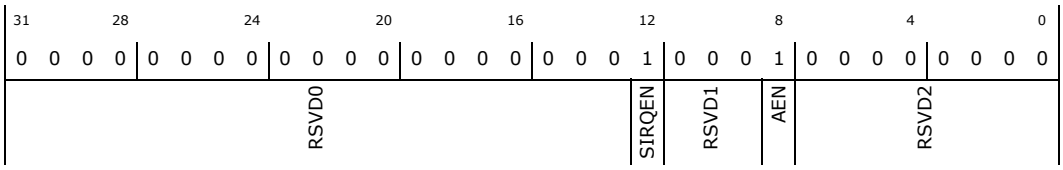
Type: Memory Mapped I/O Register (Size: 32 bits)

OIC: [ILB_BASE_ADDRESS] + 60h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00001100h



Bit Range	Default & Access	Description
31:13	0b RO	**RSVD0:** Reserved
12	1b RW	**SIRQEN:** When set, enables the internal SIRQ . when cleared the internal sIRQ is disabled
11:9	0b RO	**RSVD1:** Reserved
8	1b RW	**AEN:** When set, enables the internal IOAPIC and its address decode, when cleared the internal IOxAPIC is disabled. software should read this register after modifying the APIC enable prior to acces to IOxAPIC addresss range.
7:0	0b RO	**RSVD2:** Reserved

34.3.48 RC—Offset 64h

RC - RTC Configuration

Access Method

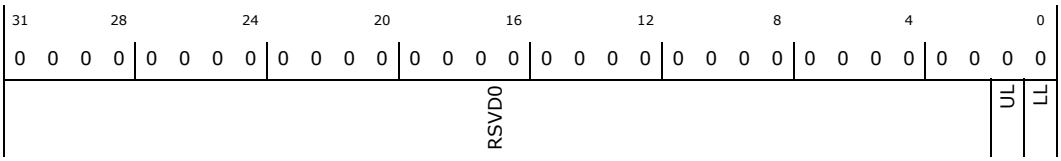
Type: Memory Mapped I/O Register (Size: 32 bits)

RC: [ILB_BASE_ADDRESS] + 64h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0b RO	**RSVD0:** Reserved
1	0b RW/L	**UL:** Upper 128 Byte Lock (UL): When set, bytes 38h-3Fh in the upper 128 byte bank of RTC RAM are locked. Writes will be dropped and reads will not return any guaranteed data.
0	0b RW/L	**LL:** Lower 128 Byte Lock (LL): When set, bytes 38h-3Fh in the lower 128 byte bank of RTC RAM are locked. Writes will be dropped and reads will not return any guaranteed data.

34.3.49 BCS - BIOS Control Status (BCS)—Offset 6Ch

Access Method

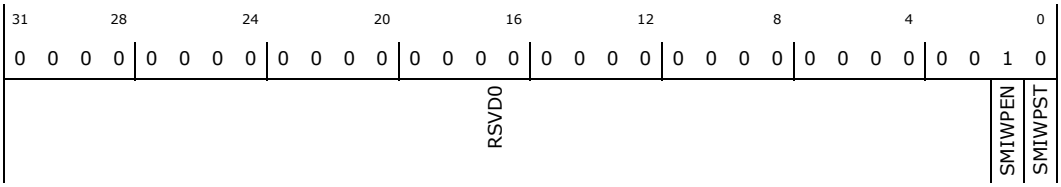
Type: Memory Mapped I/O Register (Size: 32 bits)

BCS: [ILB_BASE_ADDRESS] + 6Ch

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000002h



Bit Range	Default & Access	Description
31:2	0b RO	**RSVD0:** Reserved
1	1b RW	**SMIWPEN:** SMI WP Enable (SMIWPEN): When this bit is set to a 1, it enables the LPC to generate SMI upon not SMM code is trying to set BC.WP from a 0 to a 1 while BC.LE is set.

Bit Range	Default & Access	Description
0	0b RW/1C	**SMIWPST:** SMI WP Status (SMIWPST): Set when SMI is generated upon trying to set BC.WP from a 0 to a 1 by not SMM code (while BC.LE and SMIWPEN are set). Write a 1 to this bit should clear it and clear the SMI (send DEASSERT_SMI)

34.3.50 LE—Offset 70h

Access Method

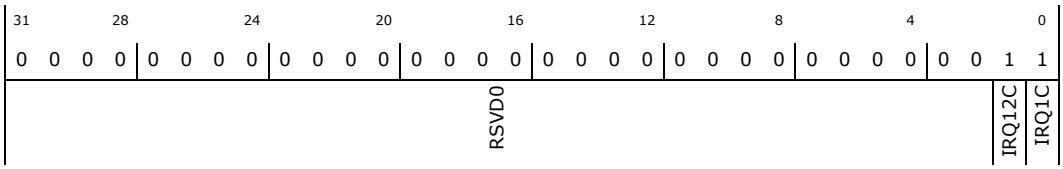
Type: Memory Mapped I/O Register (Size: 32 bits)

LE: [ILB_BASE_ADDRESS] + 70h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000003h



Bit Range	Default & Access	Description
31:2	0b RO	**RSVD0:** Reserved
1	1b RW	**IRQ12_CAUSE (IRQ12C):** When software sets the bit to 1, IRQ12 will be high (asserted), When software set bit to 0,IRQ12 will be low (deasserted). default for this bit is 1
0	1b RW	**IRQ1_CAUSE (IRQ1C):** When software sets the bit to 1, IRQ11 will be high (asserted), When software set bit to 0,IRQ1 will be low (deasserted). default for this bit is 1

34.3.51 NMI (GNMI)—Offset 80h

NMI register

Access Method

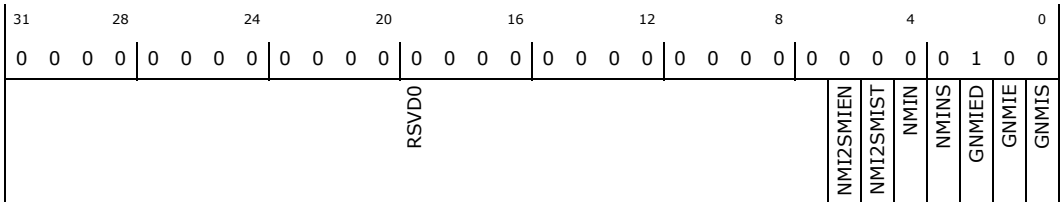
Type: Memory Mapped I/O Register (Size: 32 bits)

GNMI: [ILB_BASE_ADDRESS] + 80h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000004h



Bit Range	Default & Access	Description
31:7	0b RO	**RSVD0:** Reserved
6	0b RW	**NMI2SMIEN:** NMI to SMI Enable (NMI2SMIEN): When set, instead of NMI messgae SMI message will be sent.
5	0b RO	**NMI2SMIST:** NMI to SMI bit Status (NMI2SMIST)
4	0b RW/1C	**NMIN:** NMI NOW (NMIN): When set, NMI messgae will be sent. Writing 1'b1 to NMI_NOW inverts NMI_MOW and NMI_NOW_STS value
3	0b RO	**NMINS:** NMI_NOW_STS is a result of the NMI_NOW configuration bit. Writing 1'b1 to NMI_NOW inverts NMI_NOW_STS value. Resulting that the first time NMI_NOW is written sets the NMI_NOW_STS and initiates NMI. Next writing clears the NMI_NOW_STS and allows initiating NMI by the next writing to NMI_NOW
2	1b RW	**GNMIED:** GPIO NMI Edge Detction (GNMIED): When set, NMI messgae will be sent on NMI GPIO posedge. when cleared the NMI message will be sent on negedge
1	0b RW	**GNMIE:** GPIO NMI Enable (GNMIE): When set, NMI messgae will be sent when NMI GPIO occured. when cleared the message will not be sent
0	0b RW/1C	**GNMS (GNMIS):** GPIO NMI Status (GNMIS), when NMI is recieved from GPIO this bit is set. write '1' to this register to clear the status bit

34.3.52 LPCC—Offset 84h

LPC Control register

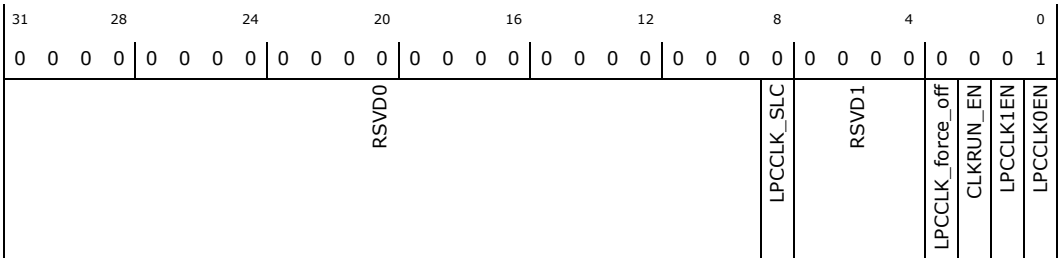
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

LPCC: [ILB_BASE_ADDRESS] + 84h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)
ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000001h



Bit Range	Default & Access	Description
31:9	0b RO	**RSVD0:** Reserved
8	0b RO	**LPCCLK_SLC:** iLPCCLK mux select (0 - ilpcclk0, 1 ilpcclk1)This bit get value from soft strap.
7:4	0b RO	**RSVD1:** Reserved

Bit Range	Default & Access	Description
3	0b RW	**LPCCLK_force_off:** when asserted,oLPCCLK shut off similarly to CLKRUN protocol while ignoring iCLKRUN (LPC device reactions)
2	0b RW	**CLKRUN_EN:** LPC CLKRUN protocol enable (when not asserted, oLPCCLK toggles)
1	0b RO	**LPCCLK1EN:** Clock 1 Enable (EN): This bit get value from soft strap. When set, LPC clock 1 is enabled. When cleared, it is disabled.
0	1b RO	**LPCCLK0EN:** Clock 0 Enable (EN): When set, LPC clock 0 is enabled. When cleared, it is disabled.

34.3.53 IRQEN (IRQE)—Offset 88h

IRQ Enable Control

Access Method

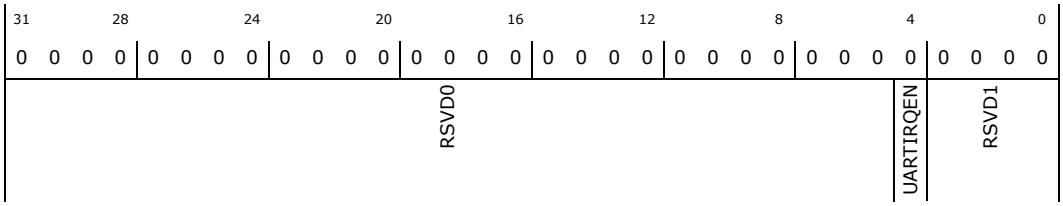
Type: Memory Mapped I/O Register (Size: 32 bits)

IRQE: [ILB_BASE_ADDRESS] + 88h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000000h

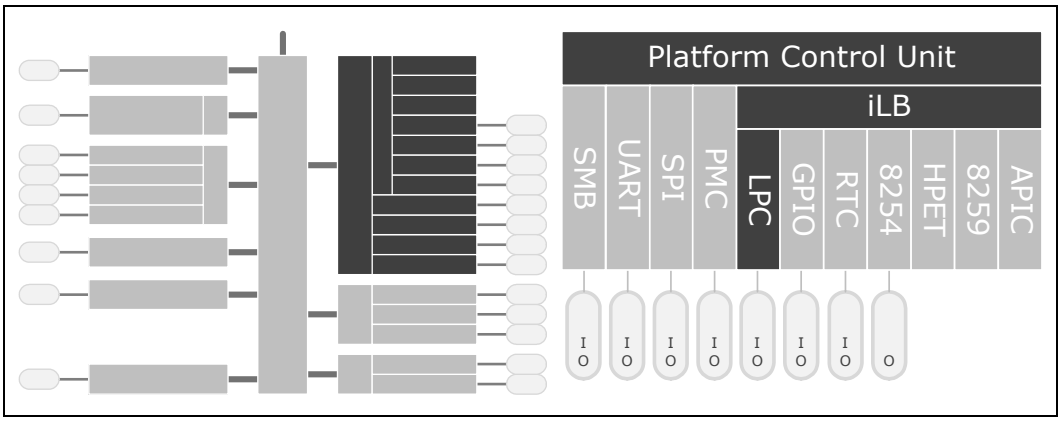


Bit Range	Default & Access	Description
31:5	0b RO	**RSVD0:** Reserved
4	0b RO	**UARTIRQEN:** UART IRQ4 Enable
3:0	0b RO	**RSVD1:** Reserved

35 PCU – iLB – Low Pin Count (LPC) Bridge

The SoC implements an LPC Interface as described in the LPC 1.1 Specification. The Low Pin Count (LPC) bridge function of the SoC resides in PCI Device 31, Function 0.

Note: In addition to the LPC bridge interface function, D31:F0 contains other functional units including interrupt controllers, timers, power management, system management, GPIO, and RTC.



35.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description:** A brief explanation of the signal's function

Note: If the VGA interfaces is used, VLPC must have a nominal voltage of 3.3V.

Table 322. LPC Signals

Signal Name	Direction Plat. Power	Description
ILB_LPC_AD[3:0]	I/O VLPC	**LPC Multiplexed Command, Address, Data:** Internal pull-ups are provided for these signals. *These signals are muxed and may be used by other functions.*
ILB_LPC_CLK[0]	O VLPC	**LPC Clock [0] Out:** 33 MHz PCI-like clock driven to LPC peripherals. *These signals are muxed and may be used by other functions.*
ILB_LPC_CLK[1]	O or I VLPC	**LPC Clock [1] Out:** 33 MHz PCI-like clock driven to LPC peripherals. Can be configured as an input to compensate for board routing delays through Soft Strap. *These signals are muxed and may be used by other functions.*
ILB_LPC_CLKRUN#	I/OD VLPC	**LPC Clock Run:** Input to determine the status of ILB_LPC_CLK and an open drain output used to request starting or speeding up ILB_LPC_CLK. This is a sustained tri-state signal used by the central resource to request permission to stop or slow ILB_LPC_CLK. The central resource is responsible for maintaining the signal in the asserted state when ILB_LPC_CLK is running and deasserts the signal to request permission to stop or slow ILB_LPC_CLK. An internal pull-up is provided for this signal. *This signal is muxed and may be used by other functions.*
ILB_LPC_FRAME#	O VLPC	**LPC Frame:** This signal indicates the start of an LPC cycle, or an abort. *This signal is muxed and may be used by other functions.*
ILB_LPC_SERIRQ	I/O V1P8S	**Serial Interrupt Request:** This signal implements the serial interrupt protocol. *This signal is muxed and may be used by other functions.*

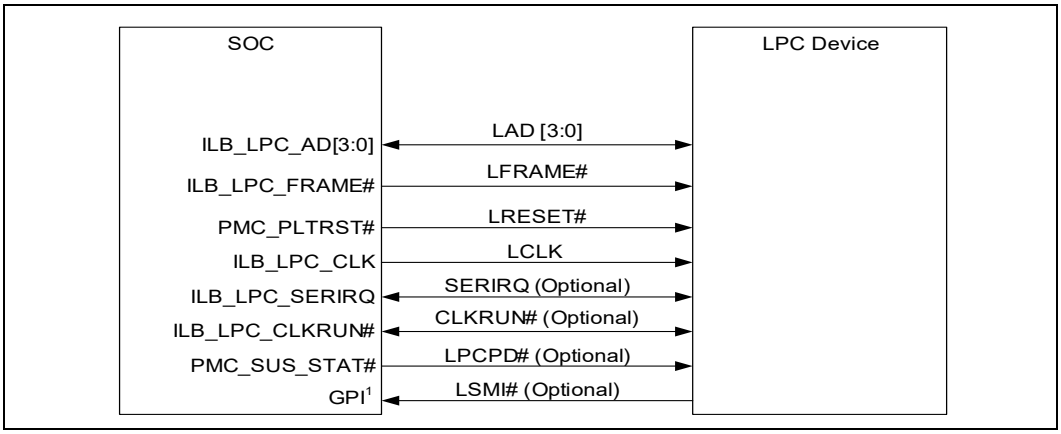
35.2 Features

The LPC interface to the SoC is shown in Figure 135. Note that the SoC implements all of the signals that are shown as optional, but peripherals are not required to do so.

Note: The LPC controller does not implement bus mastering cycles or DMA.

Note: The LPC controller is the subtractive agent of the Intel Legacy Block. All transactions not claimed elsewhere are sent to the LPC controller.

Figure 135.LPC Interface Diagram



NOTES:
1. The General Purpose Input (GPI) must use a SMI capable GPIO: GPIO_S0_SC[7:0].

35.2.1 Memory Cycle Notes

For cycles below 16M, the LPC Controller will perform standard LPC memory cycles. For cycles targeting firmware (BIOS/EFI code only), firmware memory cycles are used. Only 8-bit transfers are performed. If a larger transfer appears, the LPC controller will break it into multiple 8-bit transfers until the request is satisfied.

If the cycle is not claimed by any peripheral (and subsequently aborted), the LPC Controller will return a value of all 1's to the CPU.

35.2.2 Trusted Platform Module (TPM) 1.2 Support

The LPC interface supports accessing Trusted Platform Module (TPM) 1.2 and 2.0 devices via the LPC TPM START encoding. Memory addresses within the range FED40000h to FED40FFFh will be accepted by the LPC Bridge and sent on LPC as TPM special cycles. No additional checking of the memory cycle is performed.

Note: This is different to the FED00000h to FED4BFFFh range implemented on some other Intel components since no Intel® Trusted Execution Technology (Intel® TXT) transactions are supported.

35.2.3 FWH Cycle Notes

If the LPC controller receives any SYNC returned from the device other than short (0101), long wait (0110), or ready (0000) when running a FWH cycle, indeterminate results may occur. A FWH device is not allowed to assert an Error SYNC.

BIOS/EFI boot from LPC is not supported when Secure Boot is enabled.

35.2.4 Other Notes

All cycles that are not decoded internally, and are not targeted for LPC (i.e. configuration cycles and IO cycles above 64kb) will be sent to LPC with ILB_LPC_FRAME# not asserted. Memory cycles above 16 MB that are not decoded internally, and are not targeted for LPC will be sent to LPC with ILB_LPC_FRAME# asserted.

35.2.5 POST Code Redirection

Writes to addresses 80h - 8Fh in IO register space will also be passed to the LPC bus.

Note: Reads of these addresses do not result in any LPC transactions.

35.2.6 Power Management

35.2.6.1 LPCPD# Protocol

Same timings as for PMC_SUS_STAT#. After driving PMC_SUS_STAT# active, the SoC drives ILB_LPC_FRAME# low, and tri-states (or drives low) ILB_LPC_AD[3:0].

Note: The Low Pin Count Interface Specification, Revision 1.1 defines the LPCPD# protocol where there is at least 30 µs from LPCPD# assertion to LRST# assertion. This specification explicitly states that this protocol only applies to entry/exit of low power states which does not include asynchronous reset events. The SoC asserts both PMC_SUS_STAT# (connects to LPCPD#) and ILB_PLTRST# (connects to LRST#) at the same time during a global reset. This is not inconsistent with the LPC LPCPD# protocol.

35.2.6.2 Clock Run (CLKRUN)

When there are no pending LPC cycles, and SERIRQ is in quiet mode, the SoC can shut down the LPC clock. The SoC indicates that the LPC clock is going to shut down by de-asserting the ILB_LPC_CLKRUN# signal. LPC devices that require the clock to stay running should drive ILB_LPC_CLKRUN# low within 4 clocks of its de-assertion. If no device drives the signal low within 4 clocks, the LPC clock will stop. If a device asserts ILB_LPC_CLKRUN#, the SoC will start the LPC clock and assert ILB_LPC_CLKRUN#.

Note: The CLKRUN protocol is disabled by default. See Section 35.3.2.2, "Clock Run Enable" on page 4534 for further details.

35.2.7 Serialized IRQ (SERIRQ)

35.2.7.1 Overview

The interrupt controller supports a serial IRQ scheme. The signal used to transmit this information is shared between the interrupt controller and all peripherals that support serial interrupts. The signal line, ILB_LPC_SERIRQ, is synchronous to LPC clock, and follows the sustained tri-state protocol that is used by LPC signals. The serial IRQ protocol defines this sustained tri-state signaling in the following fashion:

- **S - Sample Phase:** Signal driven low
- **R - Recovery Phase:** Signal driven high
- **T - Turn-around Phase:** Signal released

The interrupt controller supports 21 serial interrupts. These represent the 15 ISA interrupts (IRQ0- 1, 3-15), the four PCI interrupts, and the control signals SMI# and IOCHK#. Serial interrupt information is transferred using three types of frames:

- Start Frame: ILB_LPC_SERIRQ line driven low by the interrupt controller to indicate the start of IRQ transmission
- Data Frames: IRQ information transmitted by peripherals. The interrupt controller supports 21 data frames.
- Stop Frame: ILB_LPC_SERIRQ line driven low by the interrupt controller to indicate end of transmission and next mode of operation.

35.2.7.2 Start Frame

The serial IRQ protocol has two modes of operation which affect the start frame:

- Continuous Mode: The interrupt controller is solely responsible for generating the start frame
- Quiet Mode: Peripheral initiates the start frame, and the interrupt controller completes it.

These modes are entered via the length of the stop frame.

Continuous mode must be entered first, to start the first frame. This start frame width is 8 LPC clocks. This is a polling mode.

In Quiet mode, the ILB_LPC_SERIRQ line remains inactive and pulled up between the Stop and Start Frame until a peripheral drives ILB_LPC_SERIRQ low. The interrupt controller senses the line low and drives it low for the remainder of the Start Frame. Since the first LPC clock of the start frame was driven by the peripheral, the interrupt controller drives ILB_LPC_SERIRQ low for 1 LPC clock less than in continuous mode. This mode of operation allows for lower power operation.

35.2.7.3 Data Frames

Once the Start frame has been initiated, the ILB_LPC_SERIRQ peripherals start counting frames based on the rising edge of ILB_LPC_SERIRQ. Each of the IRQ/DATA frames has exactly 3 phases of 1 clock each:

- **Sample Phase:** During this phase, a device drives ILB_LPC_SERIRQ low if its corresponding interrupt signal is low. If its corresponding interrupt is high, then the ILB_LPC_SERIRQ devices tri-state ILB_LPC_SERIRQ. ILB_LPC_SERIRQ remains high due to pull-up resistors.
- **Recovery Phase:** During this phase, a device drives ILB_LPC_SERIRQ high if it was driven low during the Sample Phase. If it was not driven during the sample phase, it remains tri-stated in this phase.
- **Turn-around Phase:** The device tri-states ILB_LPC_SERIRQ.

35.2.7.4 Stop Frame

After the data frames, a Stop Frame will be driven by the interrupt controller. ILB_LPC_SERIRQ will be driven low for two or three LPC clocks. The number of clocks is determined by the SCNT.MD register bit. The number of clocks determines the next mode, as indicated in Table 323.

Table 323. SERIRQ, Stop Frame Width to Operation Mode Mapping

Stop Frame Width	Next Mode
Two LPC clocks	**Quiet Mode:** Any SERIRQ device initiates a Start Frame
Three LPC clocks	**Continuous Mode:** Only the interrupt controller initiates a Start Frame

35.2.7.5 Serial Interrupts Not Supported

There are four interrupts on the serial stream which are not supported by the interrupt controller. These interrupts are:

- IRQ0: Heartbeat interrupt generated off of the internal 8254 counter 0.
- IRQ8: RTC interrupt can only be generated internally.
- IRQ13: This interrupt (floating point error) is not supported.
- IRQ14: Interrupt can only be generated by the SATA controller in Legacy mode.

The interrupt controller will ignore the state of these interrupts in the stream.

35.2.7.6 Data Frame Format and Issues

Table below shows the format of the data frames. The decoded INT[A:D]# values are ANDed with the corresponding PCI-express input signals (PIRQ[A:D]#). This way, the interrupt can be shared.

The other interrupts decoded via SERIRQ are also ANDed with the corresponding internal interrupts. For example, if IRQ10 is set to be used as the SCI, then it is ANDed with the decoded value for IRQ10 from the SERIRQ stream.

Table 324. SERIRQ Interrupt Mapping

Data Frame #	Interrupt	Clocks Past Start Frame	Comment
1	IRQ0	2	Ignored. Can only be generated via the internal 8524
2	IRQ1	5	Before port 60h latch
3	SMI#	8	Causes SMI# if low. Sets SMI_STS.ILB_SMI_STS register bit.
4	IRQ3	11	
5	IRQ4	14	
6	IRQ5	17	
7	IRQ6	20	
8	IRQ7	23	
9	IRQ8	26	Ignored. IRQ8# can only be generated internally
10	IRQ9	29	
11	IRQ10	32	
12	IRQ11	35	
13	IRQ12	38	Before port 60h latch
14	IRQ13	41	Ignored
15	IRQ14	44	Ignored
16	IRQ15	47	
17	IOCHCK#	50	Same as ISA IOCHCK# going active.
18	PCI INTA#	53	
19	PCI INTB#	56	
20	PCI INTC#	59	
21	PCI INTD#	62	

35.3 Use

35.3.1 LPC Clock Delay Compensation

In order to meet LPC interface AC timing requirements, a LPC clock loop back is required. The operation of this loop back can be configured in two ways:

1. On the SOC: In this configuration, ILB_LPC_CLK[0] is looped back on itself on the SOC pad.

   a. Benefit:

   ILB_LPC_CLK[0] and ILB_LPC_CLK[1] are both available for system clocking

b. Drawback:

Clock delay compensation is less effective at compensating for mainboard delay

c. Soft Strap & Register Requirements:

Soft Strap LPCCLK_SLC = 0b

Configuration is reflected by register bit LPCC.LPCCLK_SLC=0b

Soft Strap LPCCLK1_ENB = 0b (ILB_LPC_CLK[1] disabled) or 1b (ILB_LPC_CLK[1] enabled)

2. Configuration is reflected by register bit LPCC.LPCCLK1EN=0b (ILB_LPC_CLK[1] disabled) or 1b (ILB_LPC_CLK[1] enabled)
3. On the main board: In this configuration, ILB_LPC_CLK[0] is looped back to ILB_LPC_CLK[1] on the main board.

   a. Benefit:

   Clock delay compensation in more effective at compensating for main board delay

   b. Drawback:

   Only ILB_LPC_CLK[0] is available for system clocking. ILB_LPC_CLK[1] must be disabled.

   c. Soft Strap & Register Requirements:

   Soft Strap LPCCLK_SLC = 1b

   Configuration is reflected by register bit LPCC.LPCCLK_SLC=1b

   Soft Strap LPCCLK1_ENB = 0b (ILB_LPC_CLK[1] disabled)

   Configuration is reflected by register bit LPCC.LPCCLK1EN=0b

35.3.2 LPC Power Management

35.3.2.1 Clock Enabling

The LPC clocks can be enabled or disabled by setting or clearing, respectively, the LPCC.LPCCLK[1:0]EN bits.

35.3.2.2 Clock Run Enable

The Clock Run protocol is disabled by default and should only be enabled once all LPC devices have been initialized. The Clock Run protocol is enabled by setting the LPCC.CLKRUN_EN register bit.

35.3.3 SERIRQ Disable

Serialized IRQ support may be disabled by setting the OIC.SIRQEN bit to 0b.

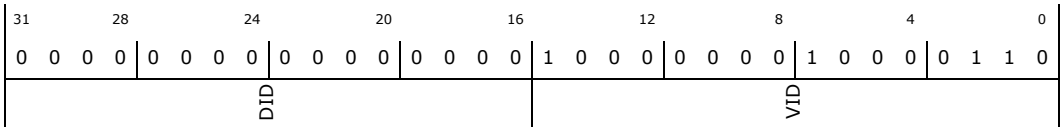
35.6.1 Identifiers Register (PCIE_REG_Identifiers)—Offset 0h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PCIE_REG_Identifiers: [B:0, D:31, F:0] + 0h

Default: 00008086h



Bit Range	Default & Access	Description
31:16	X RO	**Device Identification (DID):** This field identifies the particular device. This identifier is allocated by the vendor. This field is controlled by the LPC DID fuses Bits [31:23] are coming from the SETIDVALUE message Device ID[15:7] bits. Bits [22:21] are set constantly to 2'b00. Bits [20:16] are set constantly by pcu_did fuses.
15:0	8086h RO	**Vendor Identification (VID):** This field identifies the manufacturer of the device. Valid vendor identifiers are allocated by the PCI SIG to ensure uniqueness. 0 FFFFh is an invalid value for Vendor ID.

35.6.2 Command (PCIE_REG_COMMAND)—Offset 4h

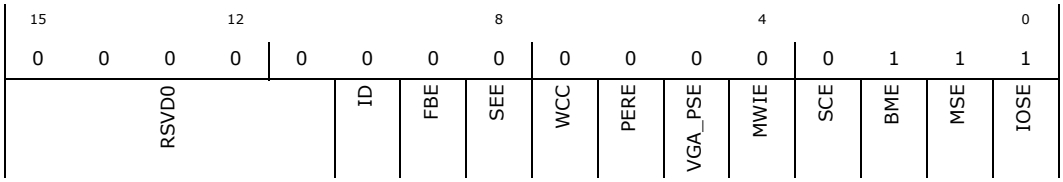
The Command register provides coarse control over a device's ability to generate and respond to PCI cycles. When a 0 is written to this register, the device is logically disconnected from the PCI bus for all accesses except configuration accesses. All devices are required to support this base level of functionality. Individual bits in the Command register may or may not be implemented depending on a device's functionality

Access Method

Type: PCI Configuration Register (Size: 16 bits)

PCIE_REG_COMMAND: [B:0, D:31, F:0] + 4h

Default: 0007h



Bit Range	Default & Access	Description
15:11	0b RO	**RSVD0:** Reserved
10	0b RO	**Interrupt Disable (ID):** This bit disables the device/function from asserting INTx#. A value of 0 enables the assertion of its INTx# signal. A value of 1 disables the assertion of its INTx# signal. The LPC bridge has no interrupts to disable
9	0b RO	**Fast Back to Back Enable (FBE):** This optional read/write bit controls whether or not a master can do fast back-to-back transactions to different devices. A value of 0 means fast back-to-back transactions are only allowed to the same agent
8	0b RW	**SERR# Enable (SEE):** This bit is an enable bit for the SERR# driver. A value of 0 disables the SERR# driver. A value of 1 enables the SERR# driver.

Bit Range	Default & Access	Description
7	0b RO	**Wait Cycle Control (WCC):** Reserved as '0' per PCI-Express spec
6	0b RW	**Parity Error Response Enable (PERE):** This bit controls the device's response to parity errors. When the bit is set, the device must take its normal action when a parity error is detected. When the bit is 0, the device sets its Detected Parity Error status bit (bit 15 in the Status register) when an error is detected, but does not assert PERR# and continues normal operation.
5	0b RO	**VGA Palette Snoop (VGA_PSE):** This bit controls how VGA compatible and graphics devices handle accesses to VGA palette registers. When this bit is 1, palette snooping is enabled (i.e., the device does not respond to palette register writes and snoops the data). When the bit is 0, the device should treat palette write accesses like all other accesses. Reserved as '0' per PCI-Express spec
4	0b RO	**Memory Write and Invalidate Enable (MWIE):** This is an enable bit for using the Memory Write and Invalidate command. When this bit is 1, masters may generate the command. When it is 0, Memory Write must be used instead. Reserved as '0' per PCI-Express spec
3	0b RO	**Special Cycle Enable (SCE):** Controls a device's action on Special Cycle operations. A value of 0 causes the device to ignore all Special Cycle operations. A value of 1 allows the device to monitor Special Cycle operations. Reserved as '0' per PCI-Express spec
2	1b RO	**Bus Master Enable (BME):** Controls a device's ability to act as a master on the PCI bus. A value of 0 disables the device from generating PCI accesses. A value of 1 allows the device to behave as a bus master. Bus master cannot be disabled on LPC
1	1b RO	**Memory Space Enable (MSE):** Controls a device's response to Memory Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to Memory Space accesses. Memory space cannot be disable on LPC
0	1b RO	**I/O Space Enable (IOSE):** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. I/O space cannot be disable on LPC

35.6.3 Status (PCIE_REG_STATUS)—Offset 6h

The Status register is used to record status information for PCI bus related events. Reads to this register behave normally. Writes are slightly different in that bits can be reset, but not set. A one bit is reset (if it is not read-only) whenever the register is written, and the write data in the corresponding bit location is a 1. For instance, to clear bit 14 and not affect any other bits, write the value 0100_0000_0000_0000b to the register.

Access Method

Type: PCI Configuration Register (Size: 16 bits)

PCIE_REG_STATUS: [B:0, D:31, F:0] + 6h

Default: 0210h

15			12				8				4				0
0	0	0	0	0	0	1	0	0	0	0	1	0	0	0	0
DPE	SSE	RMA	RTA	STA	DTS		DPD	FBC	RSVD0	C66	CLIST	IS	RSVD1		

Bit Range	Default & Access	Description
15	0b RW	**Detected Parity Error (DPE):** This bit must be set by the device whenever it detects a parity error, even if parity error handling is disabled (as controlled by bit 6 in the Command register).

Bit Range	Default & Access	Description
14	0b RW	**Signaled System Error (SSE):** This bit must be set whenever the device asserts SERR#. Set when the LPC bridge signals a system error to the internal SERR# logic.
13	0b RW	**Received Master Abort (RMA):** This bit must be set by a master device whenever its transaction (except for Special Cycle) is terminated with Master-Abort. All master devices must implement this bit.
12	0b RW	**Received Target Abort: (RTA):** This bit must be set by a master device whenever its transaction is terminated with Target-Abort. All master devices must implement this bit.
11	0b RW	**Signaled Target Abort (STA):** This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target- Abort do not need to implement this bit.
10:9	01b RO	**DEVSEL# Timing Status (DTS):** These bits encode the timing of DEVSEL#. These are encoded as 00b for fast, 01b for medium, and 10b for slow (11b is reserved). These bits Indicate medium timing, although this has no meaning on the backbone
8	0b RW	**Data Parity Error Detected (DPD):** This bit is only implemented by bus masters. It is set when three conditions are met: 1) the bus agent asserted PERR# itself (on a read) or observed PERR# asserted (on a write); 2) the agent setting the bit acted as the bus master for the operation in which the error occurred; and 3) the Parity Error Response bit (Command register) is set.
7	0b RO	**Fast Back to Back Capable (FBC):** This optional read-only bit indicates whether or not the target is capable of accepting fast back-to-back transactions when the transactions are not to the same agent. This bit can be set to 1 if the device can accept these transactions and must be set to 0 otherwise. This bit has no meaning on internal backbone.
6	0b RO	**RSVD0:** Reserved
5	0b RO	**66 MHz Capable (C66):** This optional read-only bit indicates whether or not this device is capable of running at 66 MHz. A value of zero indicates 33 MHz. A value of 1 indicates that the device is 66 MHz capable. This bit has no meaning on internal backbone
4	1b RO	**Capabilities List (CLIST):** This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h. A value of zero indicates that no New Capabilities linked list is available. A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities. There is a capabilities list in the LPC bridge.
3	0b RO	**Interrupt Status (IS):** This read-only bit reflects the state of the interrupt in the device/function. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. The LPC bridge does not generate interrupts
2:0	0b RO	**RSVD1:** Reserved

35.6.4 Revision ID and Class Code (PCIE_REG_REVISION_ID_CLASS_CODE)—Offset 8h

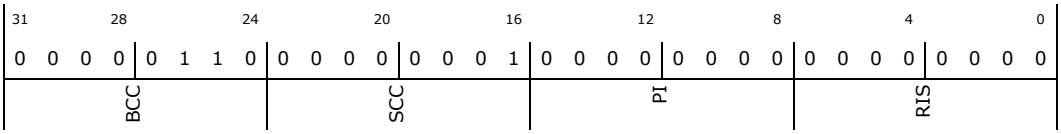
This register is a combination of two registers the Revision ID register and the Class Code register. The revision ID register specifies a device specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. The Class Code register is read-only and is used to identify the generic function of the device and, in some cases, a specific registerlevel programming interface.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PCIE_REG_REVISION_ID_CLASS_CODE: [B:0, D:31, F:0] + 8h

Default: 06010000h



Bit Range	Default & Access	Description
31:24	06h RO	**Base Class Code (BCC):** This field is a base class code which broadly classifies the type of function the device performs. Indicates the device is a bridge device.
23:16	01h RO	**Sub-Class Code (SCC):** This field is a sub-class code which identifies more specifically the function of the device. Indicates the device a PCI to ISA bridge
15:8	00h RO	**Programming Interface (PI):** This field identifies a specific register-level programming interface if any) so that device independent software can interact with the device. The LPC bridge has no programming interface.
7:0	X RO	**Revision ID (RIS):** This register specifies a device specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. This field should be viewed as a vendor defined extension to the Device ID. This field is controlled by the LPC RID fuses. Coming from the SETIDVALUE message Revision ID field

35.6.5 Master Latency Timer (PCIE_REG_MASTER_LAT_TIMER)—Offset Dh

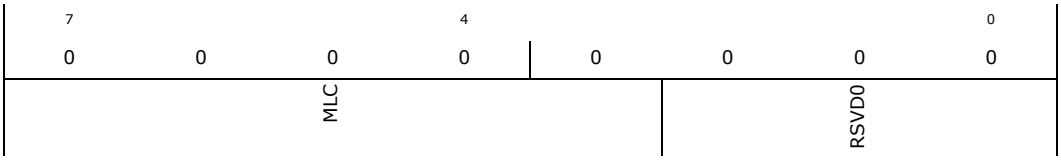
This register specifies, in units of PCI bus clocks, the value of the Latency Timer for this PCI bus master. This register is implemented as read-only, the register must be initialized to 0.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

PCIE_REG_MASTER_LAT_TIMER: [B:0, D:31, F:0] + Dh

Default: 00h



Bit Range	Default & Access	Description
7:3	00h RO	**Master Latency Count (MLC):** Reserved per PCIe spec.
2:0	0b RO	**RSVD0:** Reserved

35.6.6 Header Type (PCIE_REG_HEADER_TYPE)—Offset Eh

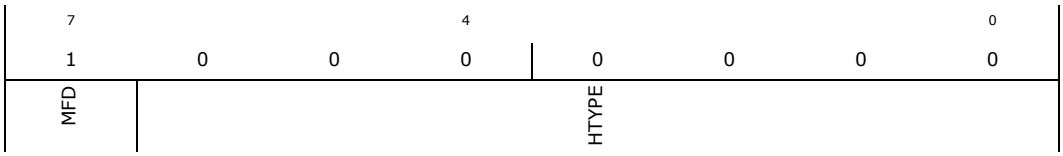
This byte identifies the layout of the second part of the predefined header (beginning at byte 10h in Configuration Space) and also whether or not the device contains multiple functions.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

PCIE_REG_HEADER_TYPE: [B:0, D:31, F:0] + Eh

Default: 80h



Bit Range	Default & Access	Description
7	1b RO	**Multi-function Device (MFD):** This field is used to identify a multi-function device. If the bit is 0, then the device is single function. If the bit is 1, then the device has multiple functions.
6:0	00h RO	**Header Type (HTYPE):** This field identifies the layout of the second part of the predefined header. The encoding 00h specifies the standard layout.

35.6.7 Subsystem ID and Vendor ID (PCIE_REG_SUBSYS_VENDOR_ID)—Offset 2Ch

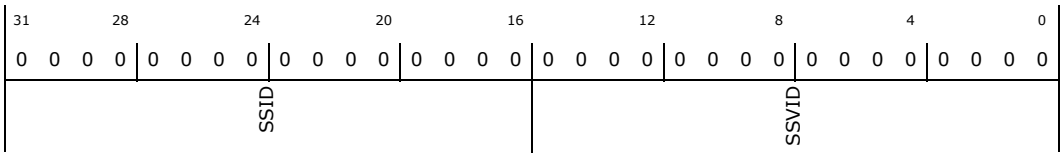
This register is used to uniquely identify the add-in card or subsystem where the PCI device resides. It provides a mechanism for add-in card vendors to distinguish their add- in cards from one another even though the add-in cards may have the same PCI controller on them (and, therefore, the same Vendor ID and Device ID). Implementation of this register is required for all PCI devices except those that have a base class 6 with sub class 0-4 (0, 1, 2, 3, 4), or a base class 8 with sub class 0-3 (0, 1, 2, 3). Subsystem Vendor IDs can be obtained from the PCI SIG and are used to identify the vendor of the add-in card or subsystem. Values for the Subsystem ID are vendor specific. Values in these registers must be loaded and valid prior to the system firmware or any system software accessing the PCI Configuration Space. How these values are loaded is not specified but could be done during the manufacturing process or loaded from external logic (e.g., strapping options, serial ROMs, etc.). These values must not be loaded using expansion ROM software because expansion ROM software is not guaranteed to be run during POST in all systems. Devices are responsible for guaranteeing the data is valid before allowing reads to these registers to complete. This can be done by responding to any accesses with Retry until the data is valid. If a device is designed to be used exclusively on the system board, the system vendor may use system specific software to initialize these registers after each power-on. This register can be written only once after PMU_PLTRST_B de-assertion.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PCIE_REG_SUBSYS_VENDOR_ID: [B:0, D:31, F:0] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value. This field could be written only once.
15:0	0000h RW	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value. This field could be written only once.

35.6.8 Capability List Pointer (PCIE_REG_CAP_POINTER)—Offset 34h

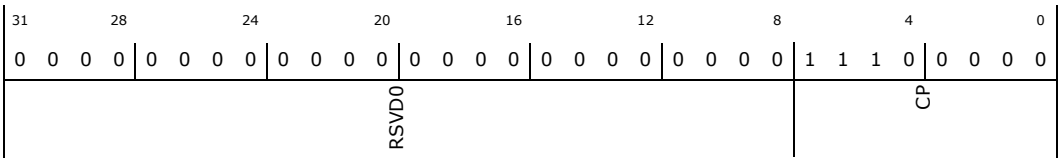
This optional register is used to point to a linked list of new capabilities implemented by this device. This register is only valid if the Capabilities List bit in the Status Register is set. If implemented, the bottom two bits are reserved and should be set to 00b. Software should mask these bits off before using this register as a pointer in Configuration Space to the first entry of a linked list of new capabilities.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PCIE_REG_CAP_POINTER: [B:0, D:31, F:0] + 34h

Default: 000000E0h



Bit Range	Default & Access	Description
31:8	0b RO	**RSVD0:** Reserved
7:0	E0h RO	**Capability Pointer (CP):** Indicates the offset of the first Capability Item.

35.6.9 ABASE (ACPI_BASE_ADDRESS)—Offset 40h

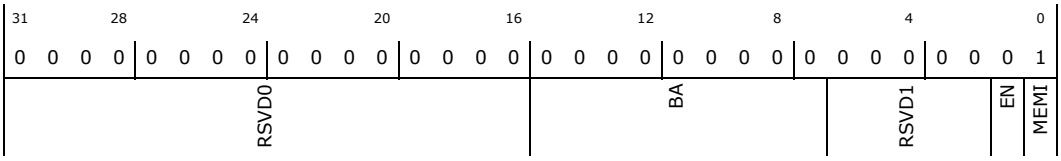
ACPI is mapped into I/O space. It is used by the PMC. Base Address registers that map into I/O Space are always 32 bits wide with bit 0 hardwired to a 1. Bit 1 is used to enable IO range pointed by this base address. Bits 31:16 are reserved and must return 0 on reads and the other bits could be used to map the device into I/O Space.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS: [B:0, D:31, F:0] + 40h

Default: 00000001h



Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:7	000h RW	**Base Address (BA):** Provides the 128 bytes of I/O space for ACPI and TCO logic
6:2	0b RO	**RSVD1:** Reserved

Bit Range	Default & Access	Description
1	0b RW	**Enable (EN):** When set, decode of the IO range pointed to by the ABASE is enabled.
0	1b RO	**Memory Space Indication (MEMI):** This read-only bit always is 1, indicating that this BAR is IO mapped

35.6.10 PBASE (PMC_BASE_ADDRESS)—Offset 44h

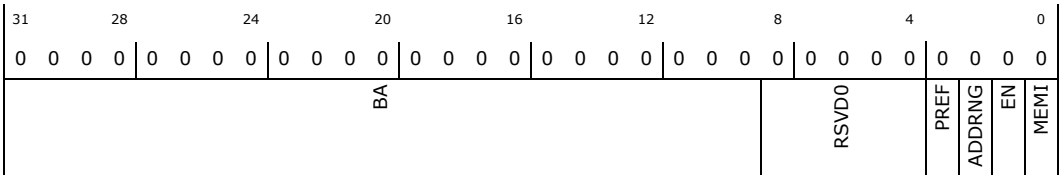
PMC registers are mapped into memory space. It is used by the PMC. Base Address registers that map into Memory Space are always 32 bits wide bit 0 hardwired to a 0. Bit 1 is used to enable memory range pointed by this base address. For Memory Base Address registers, bit 2 indicates if base address could be on 64 bit space or only on 32 bit space. Bit 3 should be set to 1 if the data is prefetchable and reset to 0 otherwise

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS: [B:0, D:31, F:0] + 44h

Default: 00000000h



Bit Range	Default & Access	Description
31:9	000000h RW	**Base Address (BA):** Provides 512 byte system memory base address for the PMC logic
8:4	0b RO	**RSVD0:** Reserved
3	0b RO	**Prefetchable (PREF):** Hardwired to 0. Indicated that this BAR is not prefetchable. Set to one, only if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables, and host bridges can merge processor writes into this range without causing errors.
2	0b RO	**Address Range (ADDRNG):** If set indicates that this BAR can be located in 64 bit address space, if clear indicates that this BAR can be located only in 32 bit address space.
1	0b RW	**Enable (EN):** When set, decode of the memory range pointed to by the PBASE is enabled.
0	0b RO	**Memory Space Indication (MEMI):** This read-only bit always is 0, indicating that this BAR is memory mapped

35.6.11 GBASE (GPIO_BASE_ADDRESS)—Offset 48h

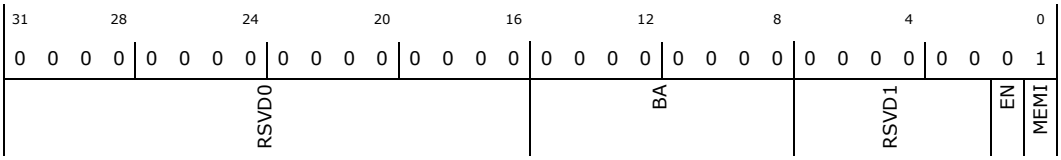
GPIO registers are mapped into I/O space. It is used by the Proxy agent (to IO controllers). Base Address registers that map into I/O Space are always 32 bits wide with bit 0 hardwired to a 1. Bit 1 is used to enable IO range pointed by this base address. Bits 31:16 are reserved and must return 0 on reads and the other bits could be used to map the device into I/O Space.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GPIO_BASE_ADDRESS: [B:0, D:31, F:0] + 48h

Default: 00000001h



Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:8	00h RW	**Base Address (BA):** Provides the 256 bytes of I/O space for GPIO logic
7:2	0b RO	**RSVD1:** Reserved
1	0b RW	**Enable (EN):** When set, decode of the IO range pointed to by the GBASE is enabled.
0	1b RO	**Memory Space Indication (MEMI):** This read-only bit always is 1, indicating that this BAR is IO mapped

35.6.12 IOBASE (IO_CONTROLLER_BASE_ADDRESS)—Offset 4Ch

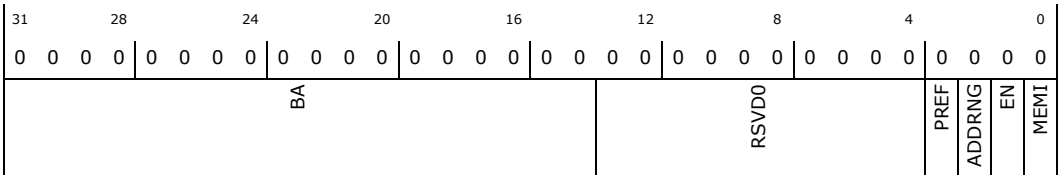
IO Controllers registers are mapped into memory space. It is used by the Proxy agent (to IO controllers). Base Address registers that map into Memory Space are always 32 bits wide bit 0 hardwired to a 0. Bit 1 is used to enable memory range pointed by this base address. For Memory Base Address registers, bit 2 indicates if base address could be on 64 bit space or only on 32 bit space. Bit 3 should be set to 1 if the data is prefetchable and reset to 0 otherwise

Access Method

Type: PCI Configuration Register (Size: 32 bits)

IO_CONTROLLER_BASE_ADDRESS: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:14	00000h RW	**Base Address (BA):** Provides 8K byte system memory base address for the IO controllers logic
13:4	0b RO	**RSVD0:** Reserved

Bit Range	Default & Access	Description
3	0b RO	**Prefetchable (PREF):** Hardwired to 0. Indicated that this BAR is not prefetchable. Set to one, only if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables, and host bridges can merge processor writes into this range without causing errors.
2	0b RO	**Address Range (ADDRNG):** If set indicates that this BAR can be located in 64 bit address space, if clear indicates that this BAR can be located only in 32 bit address space.
1	0b RW	**Enable (EN):** When set, decode of the memory range pointed to by the IOBASE is enabled.
0	0b RO	**Memory Space Indication (MEMI):** This read-only bit always is 0, indicating that this BAR is memory mapped

35.6.13 IBASE (ILB_BASE_ADDRESS)—Offset 50h

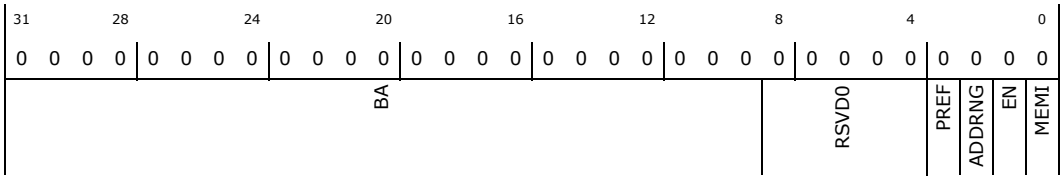
iLB registers are mapped into memory space. It is used by the iLB. Base Address registers that map into Memory Space are always 32 bits wide bit 0 hardwired to a 0. Bit 1 is used to enable memory range pointed by this base address. For Memory Base Address registers, bit 2 indicates if base address could be on 64 bit space or only on 32 bit space. Bit 3 should be set to 1 if the data is prefetchable and reset to 0 otherwise

Access Method

Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS: [B:0, D:31, F:0] + 50h

Default: 00000000h



Bit Range	Default & Access	Description
31:9	000000h RW	**Base Address (BA):** Provides 512 byte system memory base address for the iLB logic
8:4	0b RO	**RSVD0:** Reserved
3	0b RO	**Prefetchable (PREF):** Hardwired to 0. Indicated that this BAR is not prefetchable. Set to one, only if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables, and host bridges can merge processor writes into this range without causing errors.
2	0b RO	**Address Range (ADDRNG):** If set indicates that this BAR can be located in 64 bit address space, if clear indicates that this BAR can be located only in 32 bit address space.
1	0b RW	**Enable (EN):** When set, decode of the memory range pointed to by the IBASE is enabled.
0	0b RO	**Memory Space Indication (MEMI):** This read-only bit always is 0, indicating that this BAR is memory mapped

35.6.14 SBASE (SPI_BASE_ADDRESS)—Offset 54h

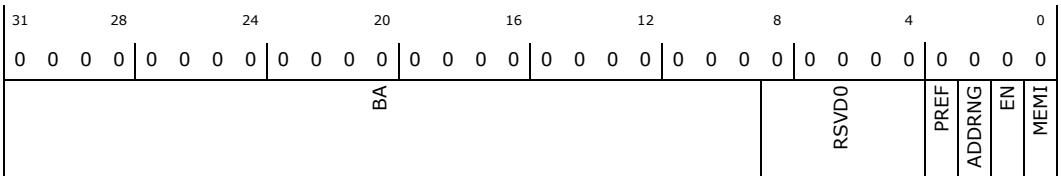
SPI registers are mapped into memory space. It is used by the SPI. Base Address registers that map into Memory Space are always 32 bits wide bit 0 hardwired to a 0. Bit 1 is used to enable memory range pointed by this base address. For Memory Base Address registers, bit 2 indicates if base address could be on 64 bit space or only on 32 bit space. Bit 3 should be set to 1 if the data is prefetchable and reset to 0 otherwise

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS: [B:0, D:31, F:0] + 54h

Default: 00000000h



Bit Range	Default & Access	Description
31:9	000000h RW	**Base Address (BA):** Provides 512 byte system memory base address for the SPI logic
8:4	0b RO	**RSVD0:** Reserved
3	0b RO	**Prefetchable (PREF):** Hardwired to 0. Indicated that this BAR is not prefetchable. Set to one, only if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables, and host bridges can merge processor writes into this range without causing errors.
2	0b RO	**Address Range (ADDRNG):** If set indicates that this BAR can be located in 64 bit address space, if clear indicates that this BAR can be located only in 32 bit address space.
1	0b RW	**Enable (EN):** When set, decode of the memory range pointed to by the SBASE is enabled.
0	0b RO	**Memory Space Indication (MEMI):** This read-only bit always is 0, indicating that this BAR is memory mapped

35.6.15 MPBASE (MPHY_BASE_ADDRESS)—Offset 58h

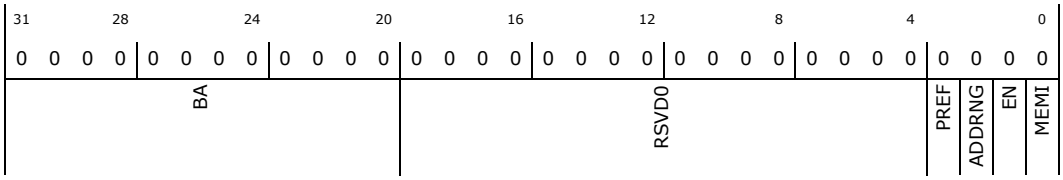
M-phys registers are mapped into memory space. It is used by the Proxy agent (to M-phys). Base Address registers that map into Memory Space are always 32 bits wide bit 0 hardwired to a 0. Bit 1 is used to enable memory range pointed by this base address. For Memory Base Address registers, bit 2 indicates if base address could be on 64 bit space or only on 32 bit space. Bit 3 should be set to 1 if the data is prefetchable and reset to 0 otherwise

Access Method

Type: PCI Configuration Register (Size: 32 bits)

MPHY_BASE_ADDRESS: [B:0, D:31, F:0] + 58h

Default: 00000000h



Bit Range	Default & Access	Description
31:20	000h RW	**Base Address (BA):** Provides 1M byte system memory base address for the M phys logic
19:4	0b RO	**RSVD0:** Reserved
3	0b RO	**Prefetchable (PREF):** Hardwired to 0. Indicated that this BAR is not prefetchable. Set to one, only if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables, and host bridges can merge processor writes into this range without causing errors.
2	0b RO	**Address Range (ADDRNG):** If set indicates that this BAR can be located in 64 bit address space, if clear indicates that this BAR can be located only in 32 bit address space.
1	0b RW	**Enable (EN):** When set, decode of the memory range pointed to by the MPBASE is enabled.
0	0b RO	**Memory Space Indication (MEMI):** This read-only bit always is 0, indicating that this BAR is memory mapped

35.6.16 PUBASE (PUNIT_BASE_ADDRESS)—Offset 5Ch

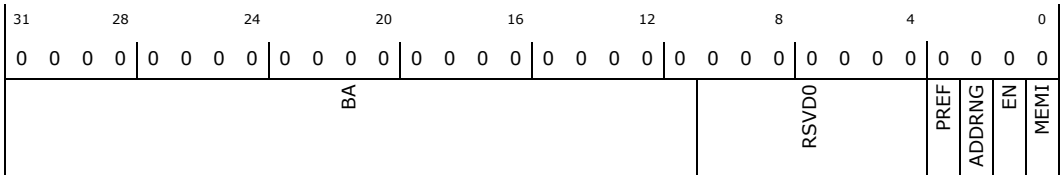
P-Unit registers are mapped into memory space. It is used by the Proxy agent (to P-Unit). Base Address registers that map into Memory Space are always 32 bits wide bit 0 hardwired to a 0. Bit 1 is used to enable memory range pointed by this base address. For Memory Base Address registers, bit 2 indicates if base address could be on 64 bit space or only on 32 bit space. Bit 3 should be set to 1 if the data is prefetchable and reset to 0 otherwise

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PUNIT_BASE_ADDRESS: [B:0, D:31, F:0] + 5Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:11	00000h RW	**Base Address (BA):** Provides 2K byte system memory base address for the P-Unit registers
10:4	0b RO	**RSVD0:** Reserved

Bit Range	Default & Access	Description
3	0b RO	**Prefetchable (PREF):** Hardwired to 0. Indicated that this BAR is not prefetchable. Set to one, only if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables, and host bridges can merge processor writes into this range without causing errors.
2	0b RO	**Address Range (ADDRNG):** If set indicates that this BAR can be located in 64 bit address space, if clear indicates that this BAR can be located only in 32 bit address space.
1	0b RW	**Enable (EN):** When set, decode of the memory range pointed to by the PUBASE is enabled.
0	0b RO	**Memory Space Indication (MEMI):** This read-only bit always is 0, indicating that this BAR is memory mapped

35.6.17 UART Control (UART_CONT)—Offset 80h

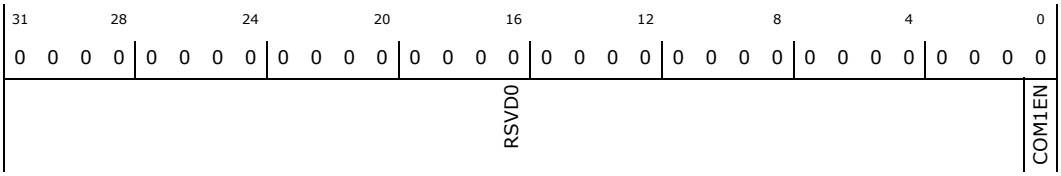
Controls the internal PCU UART ports

Access Method

Type: PCI Configuration Register (Size: 32 bits)

UART_CONT: [B:0, D:31, F:0] + 80h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0b RO	**RSVD0:** Reserved
0	0b RW	**COM1 Enable (COM1EN):** When set, enables the internal PCU COM1 UART port.

35.6.18 BIOS Decode Enable (PCIE_REG_BIOS_DECODE_EN)—Offset D8h

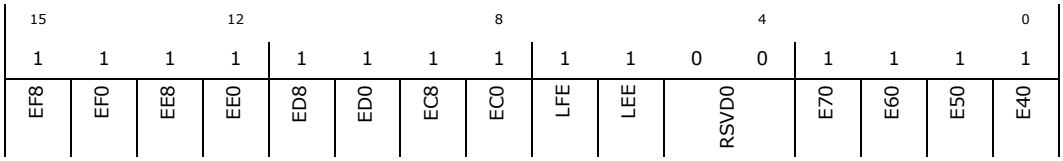
This register enables ranges in the BIOS for decoding purposes. Note that this register affects the BIOS decode regardless of whether the BIOS is resident on LPC or SPI. The concept of Feature Space does not apply to SPI-based flash. PCU EP simply decodes these ranges as memory accesses when enabled for the SPI/LPC flash interface.

Access Method

Type: PCI Configuration Register (Size: 16 bits)

PCIE_REG_BIOS_DECODE_EN: [B:0, D:31, F:0] + D8h

Default: FFCFh



15			12				8				4				0
1	1	1	1	1	1	1	1	1	1	0	0	1	1	1	1
EF8	EF0	EE8	EE0	ED8	ED0	EC8	EC0	LFE	LEE	RSVD0		E70	E60	E50	E40

Bit Range	Default & Access	Description
15	1b RW	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS range: - Data space: 0xFFF80000 - 0xFFFFFFFF - Feature space: 0xFFB80000 - 0xFFBFFFFF
14	1b RW	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS range: - Data space: 0xFFF00000 - 0xFFF7FFFF - Feature space: 0xFFB00000 - 0xFFB7FFFF
13	1b RW	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS range: - Data space: 0xFFE80000 - 0xFFEFFFFF - Feature space: 0xFFA80000 - 0xFFAFFFFF
12	1b RW	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS range: - Data space: 0xFFE00000 - 0xFFE7FFFF - Feature space: 0xFFA00000 - 0xFFA7FFFF
11	1b RW	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS range: - Data space: 0xFFD80000 - 0xFFDFFFFF - Feature space: 0XFF980000 - 0xFF9FFFFF
10	1b RW	**D0-D8 Enable (ED0):** Enables decoding of 512K of the following BIOS range: - Data space: 0xFFD00000 - 0xFFD7FFFF - Feature space: 0XFF900000 - 0xFF97FFFF
9	1b RW	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS range: - Data space: 0xFFC80000h - 0xFFCFFFFF - Feature space: 0xFF880000h - 0xFF8FFFFF
8	1b RW	**C0-C8 Enable (EC0):** Enables decoding of 512K of the following BIOS range: - Data space: 0xFFC00000 - 0xFFC7FFFF - Feature space: 0xFF800000 - 0xFF87FFFF
7	1b RW	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at 0xF0000 - 0xFFFFF
6	1b RW	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at 0xE0000 - 0xEFFFF
5:4	0b RO	**RSVD0:** Reserved
3	1b RW	**70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS range: - Data space: 0xFF700000 - 0xFF7FFFFF - Feature space: 0xFF300000 - 0xFF3FFFFF
2	1b RW	**60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS range: - Data space: 0xFF600000 - 0xFF6FFFFF - Feature Space: 0xFF200000 - 0xFF2FFFFF
1	1b RW	**50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS range: - Data space: 0xFF500000 - 0xFF5FFFFF - Feature space: 0xFF100000 - 0xFF1FFFFF
0	1b RW	**40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS range: - Data space: 0xFF400000 - 0xFF4FFFFF - Feature Space: 0xFF000000 - 0xFF0FFFFF

35.6.19 FDCAP (Feature_Detection_Capability_ID)—Offset E0h

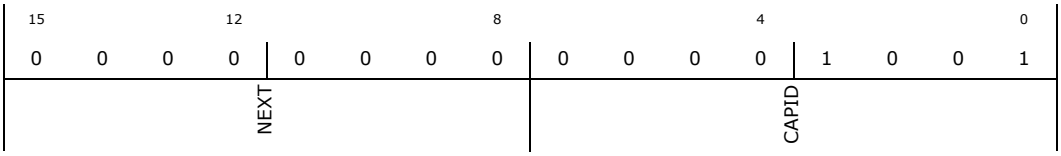
Feature detection capability ID.

Access Method

Type: PCI Configuration Register (Size: 16 bits)

Feature_Detection_Capability_ID: [B:0, D:31, F:0] + E0h

Default: 0009h



Bit Range	Default & Access	Description
15:8	00h RO	**Next Item Pointer (NEXT):** Configuration offset of the next Capability Item. 0x00 indicates the last item in the Capability List.
7:0	09h RO	**Capability ID (CAPID):** Value of 0x09 indicates a Vendor Specific Capability

35.6.20 FDLEN (Feature_Detection_Capability_Length)—Offset E2h

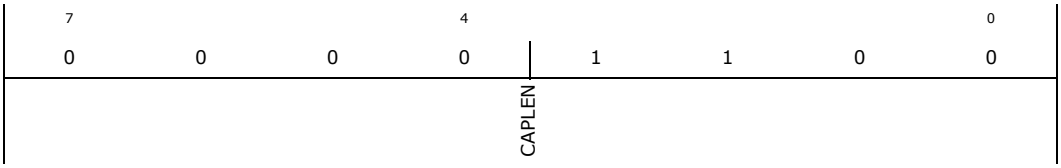
Feature detection capability length.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

Feature_Detection_Capability_Length: [B:0, D:31, F:0] + E2h

Default: 0Ch



Bit Range	Default & Access	Description
7:0	0Ch RO	**Capability Length (CAPLEN):** Indicates the length of this Vendor Specific capability, as required by PCI Spec

35.6.21 FDVER (Feature_Detection_Version_Register)—Offset E3h

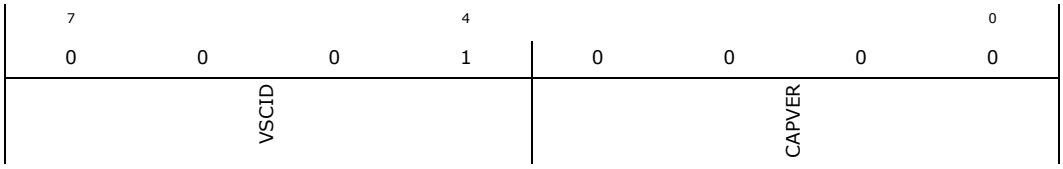
Feature detection version register.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

Feature_Detection_Version_Register: [B:0, D:31, F:0] + E3h

Default: 10h



Bit Range	Default & Access	Description
7:4	1h RO	**Vendor-Specific Capability ID (VSCID):** A value of 0x1 in this 4-bit field identifies this Capability as Feature Detection Type. This field allows software to differentiate the Feature Detection Capability from other Vendor-Specific capabilities.
3:0	0h RO	**Capability Version (CAPVER):** This field indicates the version of the Feature Detection capability

35.6.22 FVECTIDX (Feature_Vector_Index)—Offset E4h

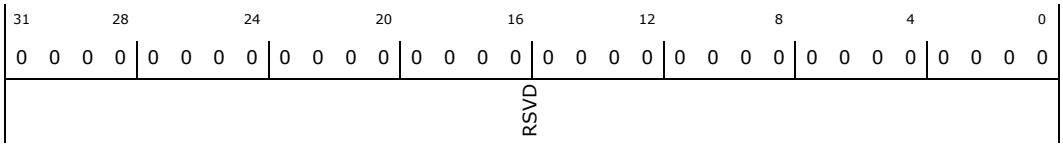
Feature vector index - Reserved

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Feature_Vector_Index: [B:0, D:31, F:0] + E4h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**RSVD:** RSVD

35.6.23 FVECTD (Feature_Vector_Data)—Offset E8h

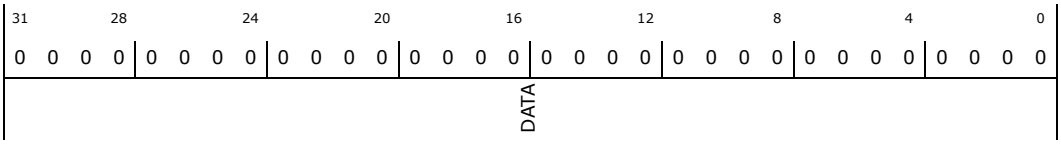
Feature vector data

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Feature_Vector_Data: [B:0, D:31, F:0] + E8h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**Data (DATA):** 32-bit data value that is taken from capability feature fuses

35.6.24 RCBA (RCRB_BASE_ADDRESS)—Offset F0h

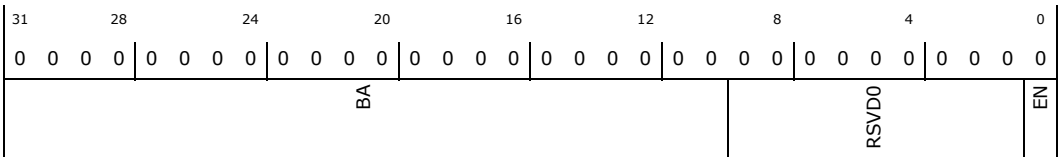
Root Complex registers are mapped into memory space. It is used by the PCU EP and Proxy engine.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

RCRB_BASE_ADDRESS: [B:0, D:31, F:0] + F0h

Default: 00000000h



Bit Range	Default & Access	Description
31:10	000000h RW	**Base Address (BA):** Base Address for the root complex register block decode range. This address is aligned on a 1KB boundary.
9:1	0b RO	**RSVD0:** Reserved
0	0b RW	**Enable (EN):** When set, enables the range specified in BA to be claimed as the RCRB.

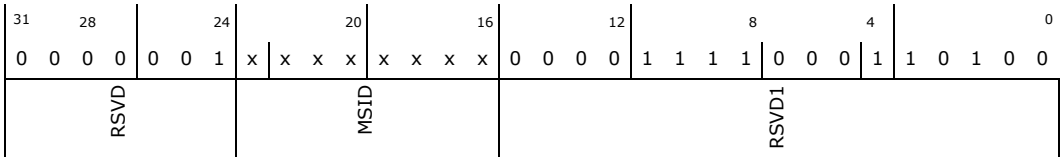
35.6.25 Manufacturer ID (PCIE_REG_MANUFACTURER_ID) - Offset F8h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

RCRB_BASE_ADDRESS: [B:0, D:31, F:0] + F8h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	01h RO	**RSVD0:** Reserved
23:16	xxh RO	**Manufacturing Stepping ID (MSID):** This value of this filed depends on the stepping of the processor • B2:0Ah • B3:0Ch • D0:11h • D1:13h
15:0	0F1Ah RO	**RSVD1:** Reserved

35.7 PCU iLB LPC BIOS Control Memory Mapped I/O Registers

Table 326. Summary of PCU iLB LPC BIOS Control Memory Mapped I/O Registers—RCRB_BASE_ADDRESS

Offset	Size	Register ID—Description	Default Value
0h	4	"GCS (RCRB_GENERAL_CONTROL)—Offset 0h" on page 4555	00000000h

35.7.1 GCS (RCRB_GENERAL_CONTROL)—Offset 0h

General Control and Status - contains BIOS configuration and status

Access Method

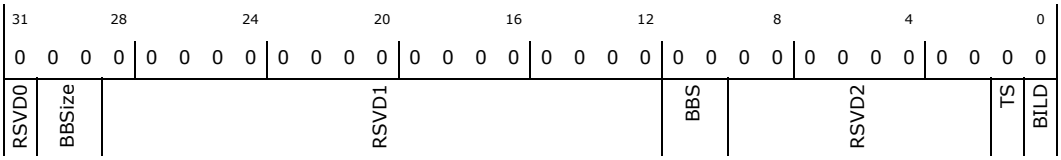
Type: Memory Mapped I/O Register (Size: 32 bits)

RCRB_GENERAL_CONTROL: [RCRB_BASE_ADDRESS] + 0h

RCRB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

RCRB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + F0h

Default: 00000000h



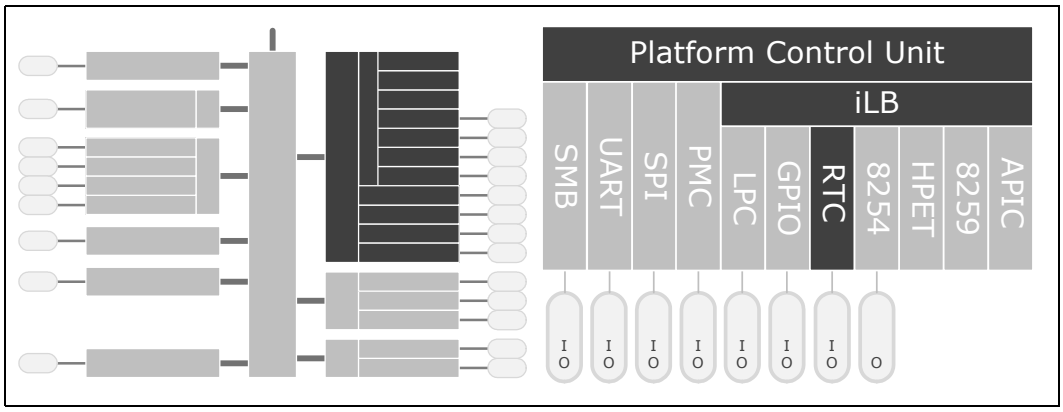
Bit Range	Default & Access	Description
31	0b RO	**RSVD0:** Reserved
30:29	X RO	**Boot Block Size (BBSize):** This field determines the size of the BIOS boot block. Default is controlled by 'Boot Block Size' soft strap. 00 : 64KB (Default) : Invert A16 if Top Swap is enabled 01 : 128KB : Invert A17 if Top Swap is enabled 10 : 256KB : Invert A18 if Top Swap is enabled 11 : Reserved This soft strap only applies when booting from SPI. Boot from LPC (FWH) only supports a 64KB boot block size (Invert A16) and this soft strap value is a don't care.
28:12	0b RO	**RSVD1:** Reserved
11:10	X RW	**Boot BIOS Straps (BBS):** This field determines the destination of accesses to the BIOS memory range. Default is controlled by 'Boot BIOS Straps' pin strap. 00 LPC 01 Reserved 10 Reserved 11 SPI The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down (bit 0) is not set.
9:2	0b RO	**RSVD2:** Reserved
1	X RW	**Top Swap (TS):** When set, PCU EP will invert either A16, A17, or A18 for cycles going to the BIOS space (but not the feature space) in the FWH. When cleared, PCU EP will not invert A16. If booting from LPC (FWH), then the Boot Blook size is 64KB and A16 is inverted if Top Swap is enabled. If booting from SPI, then the BOOT_BLOCK_SIZE soft strap determines if A16, A17, or A18 should be inverted if Top Swap is enabled. If Top-Swap pin-strap is active, then this bit cannot be cleared by software. This bit should be kept in RTC well and should be reset only by SRTCRST_b
0	0h RW	**BIOS Interface Lock-Down (BILD):** When set, prevents GCS.TS and GCS.BBS from being changed. This bit can only be written from 0 to 1 once.

36 PCU – iLB – Real Time Clock (RTC)

The SoC contains a Motorola MC146818B-compatible real-time clock with 242 bytes of battery-backed RAM. The real-time clock performs twos key functions—keeping track of the time of day and storing system data, even when the system is powered down. The RTC operates on a 32.768 kHz crystal and a 3.3 V battery.

The RTC supports two lockable memory ranges. By setting bits in the configuration space, two 8-byte ranges can be locked to read and write accesses. This prevents unauthorized reading of passwords or other system security information.

The RTC supports a date alarm that allows for scheduling a wake up event up to 30 days in advance.



36.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

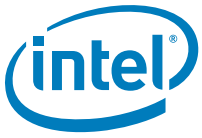


Table 327. RTC Signals

Signal Name	Direction Plat. Power	Description
ILB_RTC_X1	I VRTC	**Crystal Input 1:** This signal is connected to the 32.768 kHz crystal. If no external crystal is used, the signal can be driven with the desired clock rate.
ILB_RTC_X2	I VRTC	**Crystal Input 2:** This signal is connected to the 32.768 kHz crystal. If no external crystal is used, the signal should be left floating.
ILB_RTC_RST#	I VRTC	**RTC Reset:** An external RC circuit creates a time delay for the signal such that it will go high (de-assert) sometime after the battery voltage is valid. The RC time delay should be in the 18-25 ms range. Contact your Intel representative for details. When asserted, this signal resets all register bits in the RTC well except for GEN_PMCON1.RPS. **NOTE:** Unless registers are being cleared (only to be done in the G3 power state), the signal input must always be high when all other RTC power planes are on. **NOTE:** In the case where the RTC battery is dead or missing on the platform, the signal should be deasserted before the PMC_RSMRST# signal is deasserted.
ILB_RTC_TEST#	I VRTC	**RTC Battery Test:** An external RC circuit creates a time delay for the signal such that it will go high (de-assert) sometime after the battery voltage is valid. The RC time delay should be in the 18-25 ms range. Contact your Intel representative for details. If the battery is missing/weak, this signal appears low (asserted) at boot just after the suspend power rail (V3P3A) is up since it will not have time to meet Vih when V3P3A is high. The weak/missing battery condition is reported in the GEN_PMCON1.RPS (RTC Power Status) register. When asserted, BIOS may clear the RTC CMOS RAM. **NOTE:** Unless CMOS is being cleared (only to be done in the G3 power state) or the battery is low, the signal input must always be high when all other RTC power planes are on. **NOTE:** This signal may also be used for debug purposes, as part of a XDP port. Contact your Intel representative for details.
ILB_RTC_EXTPAD	I VRTC	**External capacitor connection**

36.2 Features

The Real Time Clock (RTC) module provides a battery backed-up date and time keeping device. Three interrupt features are available: time of day alarm with once a second to once a month range, periodic rates of 122 us to 500 ms, and end of update cycle notification. Seconds, minutes, hours, days, day of week, month, and year are counted.

The hour is represented in twelve or twenty-four hour format, and data can be represented in BCD or binary format. The design is meant to be functionally compatible with the Motorola MS146818B. The time keeping comes from a 32.768 kHz oscillating source, which is divided to achieve an update every second. The lower 14 bytes on the lower RAM block have very specific functions. The first ten are for time and date information. The next four (0Ah to 0Dh) are registers, which configure and report RTC functions. A host-initiated write takes precedence over a hardware update in the event of a collision.

36.2.1 Update Cycles

An update cycle occurs once a second, if the B.SET bit is not asserted and the divide chain is properly configured. During this procedure, the stored time and date are incremented, overflow checked, a matching alarm condition is checked, and the time and date are rewritten to the RAM locations. The update cycle starts at least 488 us after A.UIP is asserted, and the entire cycle does not take more than 1984 us to complete. The time and date RAM locations (00h to 09h) are disconnected from the external bus during this time.

36.3 Interrupts

The real-time clock interrupt is internally routed within the SoC both to the I/O APIC and the 8259. It is mapped to interrupt vector 8. This interrupt does not leave the SoC, nor is it shared with any other interrupt. IRQ8# from the ILB_LPC_SERIRQ stream is ignored. However, the High Performance Event Timers can also be mapped to IRQ8#; in this case, the RTC interrupt is blocked.

36.3.1 Lockable RAM Ranges

The RTC battery-backed RAM supports two 8-byte ranges that can be locked: the RC.UL and RC.LL register bits. When the locking bits are set, the corresponding range in the RAM is not readable or writable. A write cycle to those locations will have no effect. A read cycle to those locations will not return the location’s actual value (resultant value is undefined).

Once a range is locked, the range can be unlocked only by a hard reset, which will invoke the BIOS and allow it to re-lock the RAM range.

36.3.2 Clearing Battery-Backed RTC CMOS RAM

Clearing CMOS RAM in an SoC-based platform can be done by using a jumper on ILB_RTC_TEST# or a GPI. Implementations should not attempt to clear CMOS by using a jumper to pull RTC_VCC low.

Note: The entire Extended Bank and bytes 0Eh-7Fh of the Standard Bank will be cleared.

36.3.2.1 Using ILB_RTC_TEST# to Clear the RTC CMOS RAM

A jumper on ILB_RTC_TEST# can be used to clear CMOS values. When ILB_RTC_TEST# is low, the GEN_PMCON1.RPS register bit will be set. BIOS can monitor the state of this bit, and manually clear the RTC CMOS array once the system is booted. The normal position will cause ILB_RTC_TEST# to be pulled up through a weak pull-up resistor. This ILB_RTC_TEST# jumper technique allows the jumper to be moved and then replaced—all while the system is powered off. Then, once booted, the GEN_PMCON1.RPS bit can be detected in the set state.

36.3.3 Using a GPI to Clear CMOS

A jumper on a GPI can also be used to clear CMOS values. BIOS should detect the setting of this GPI on system boot-up, and manually clear the CMOS array.

Note: The GPI strap technique to clear CMOS requires multiple steps to implement. The system is booted with the jumper in new position, then powered back down. The jumper is replaced back to the normal position, then the system is rebooted again.

Warning: Do not implement a jumper on RTC_VCC to clear CMOS.

36.3.4 Clearing Battery Backed RTC Registers

Clearing Battery Backed RTC Registers in an SoC based platform can be done by using a jumper on ILB_RTC_RST#. Implementations should not attempt to clear the registers by using a jumper to pull RTC_VCC low. A jumper on ILB_RTC_RST# pulled to ground can be used to reset the state of those Battery Backed RTC Register configurations bit that reside in the RTC power well to their default state. Table 328 shows which bits are set to their default state when ILB_RTC_RST# is asserted low.

Table 328. Register Bits Reset by ILB_RTC_RST# Assertion (Sheet 1 of 2)

Register Bit	Bit(s)	Default State
RCRB_GENERAL_CONTROL.TS	1	xb
GEN_PMCON1.PME_B0_S5_DIS	15	0b

36.5 Register Map

36.6 IO Mapped Registers

The RTC internal registers and RAM is organized as two banks of 128 bytes each, called the standard and extended banks.

Note: It is not possible to disable the extended bank.

The first 14 bytes of the standard bank contain the RTC time and date information along with four registers, A - D, that are used for configuration of the RTC. The extended bank contains a full 128 bytes of battery backed SRAM. All data movement between the host CPU and the RTC is done through registers mapped to the standard I/O space.

Note: Registers reg_RTC_IR_type and reg_RTC_TR_type are used for data movement to and from the standard bank. Registers reg_RTC_RIR_type and reg_RTC_RTR_type are used for data movement to and from the extended bank. All of these registers have alias I/O locations, as indicated in Table 329.

Table 329. I/O Registers Alias Locations

Register	Original I/O Location	Alias I/O Location
reg_RTC_IR_type	70h	74h
reg_RTC_TR_type	71h	75h
reg_RTC_RIR_type	72h	76h
reg_RTC_RTR_type	73h	77h

36.7 Indexed Registers

The RTC contains indexed registers that are accessed via the reg_RTC_IR_type and reg_RTC_TR_type registers.

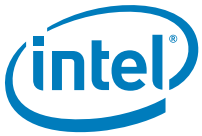

Table 330. RTC Indexed Registers

Start	End	Name
00h	00h	Seconds
01h	01h	Seconds Alarm
02h	02h	Minutes
03h	03h	Minutes Alarm
04h	04h	Hours
05h	05h	Hours Alarm
06h	06h	Day of Week
07h	07h	Day of Month
08h	08h	Month

36.8.1 IR (reg_RTC_IR_type)—Offset 70h

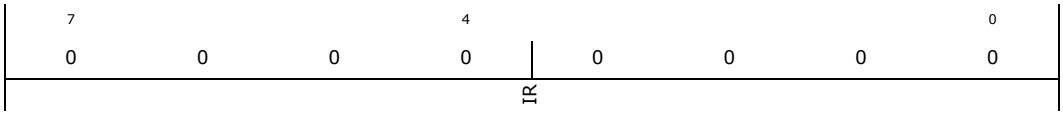
Indexed Registers

Access Method

Type: I/O Register
(Size: 8 bits)

reg_RTC_IR_type: 70h

Default: 00h



Bit Range	Default & Access	Description
7:0	X RW	**IR:** Real-Time Clock (Standard RAM) Index Register Note: Writes to 72h, 74h, and 76h do not affect the NMI enable (bit 7 of 70h)

36.8.2 TR (reg_RTC_TR_type)—Offset 71h

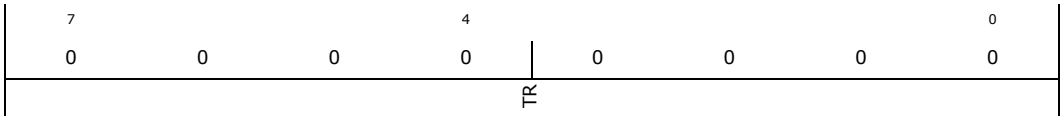
Target Registers

Access Method

Type: I/O Register
(Size: 8 bits)

reg_RTC_TR_type: 71h

Default: 00h



Bit Range	Default & Access	Description
7:0	X RW	**TR:** Real-Time Clock (Standard RAM) Target Register

36.8.3 RIR (reg_RTC_RIR_type)—Offset 72h

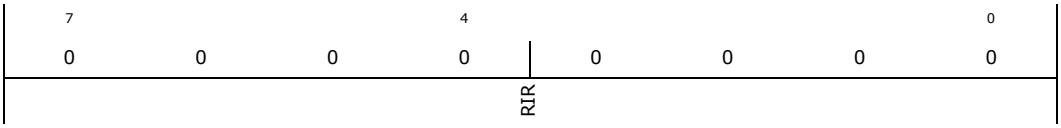
Extended RAM Index Register

Access Method

Type: I/O Register
(Size: 8 bits)

reg_RTC_RIR_type: 72h

Default: 00h



Bit Range	Default & Access	Description
7:0	X RW	**RIR:** Extended RAM Index Register

36.8.4 RTR (reg_RTC_RTR_type)—Offset 73h

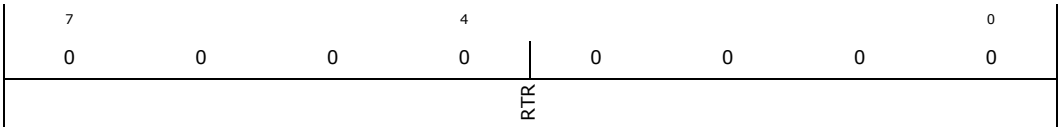
Extended RAM Target Register

Access Method

Type: I/O Register
(Size: 8 bits)

reg_RTC_RTR_type: 73h

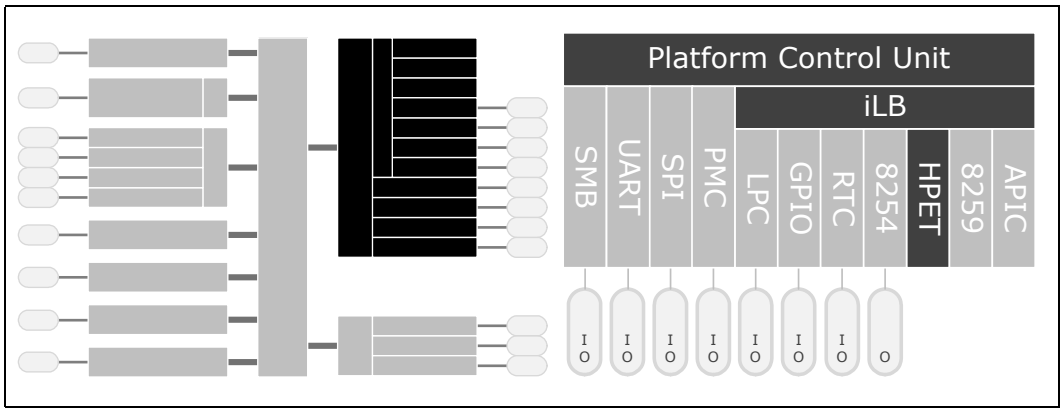
Default: 00h



Bit Range	Default & Access	Description
7:0	X RW	**RTR:** Extended RAM Target Register

37 PCU – iLB – 8254 Timers

The 8254 contains three counters which have fixed uses including system timer and speaker tone. The reference clock for the counters (1.19318 MHz) is generated from a 14.318 MHz clock divided by 12.



37.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

Table 332. 8254 Signals

Signal Name	Direction Plat. Power	Description
ILB_8254_SPKR	O V1P8S	**Speaker:** The signal drives an external speaker driver device, which in turn drives the system speaker. Upon PMC_PLTRST#, its output state is 0. *This signal is muxed and may be used by other functions.*

37.2 Features

37.2.1 Counter 0, System Timer

This counter functions as the system timer by controlling the state of IRQ0 and is programmed for Mode 3 operation. The counter produces a square wave with a period equal to the product of the counter period (838 ns) and the initial count value. The counter loads the initial count value one counter period after software writes the count value to the counter I/O address. The counter initially asserts IRQ0 and decrements the count value by two each counter period. The counter negates IRQ0 when the count value reaches 0. It then reloads the initial count value and again decrements the initial count value by two each counter period. The counter then asserts IRQ0 when the count value reaches 0, reloads the initial count value, and repeats the cycle, alternately asserting and negating IRQ0.

37.2.2 Counter 1, Refresh Request Signal

This counter is programmed for Mode 2 operation and impacts the period of the NSC.RTS register bit. Programming the counter to anything other than Mode 2 results in undefined behavior.

37.2.3 Counter 2, Speaker Tone

This counter provides the speaker tone and is typically programmed for Mode 3 operation. The counter provides a speaker frequency equal to the counter clock frequency (1.193 MHz) divided by the initial count value. The speaker must be enabled by a write to the NSC.SDE register bit.

37.3 Use

37.3.1 Timer Programming

The counter/timers are programmed in the following fashion:

1. Write a control word to select a counter.
2. Write an initial count for that counter.
3. Load the least and/or most significant bytes (as required by Control Word Bits 5, 4) of the 16-bit counter.
4. Repeat with other counters.

Only two conventions need to be observed when programming the counters. First, for each counter, the control word must be written before the initial count is written. Second, the initial count must follow the count format specified in the control word (least significant byte only, most significant byte only, or least significant byte and then most significant byte).

A new initial count may be written to a counter at any time without affecting the counter's programmed mode. Counting is affected as described in the mode definitions. The new count must follow the programmed count format.

If a counter is programmed to read/write two-byte counts, the following precaution applies: A program must not transfer control between writing the first and second byte to another routine which also writes into that same counter. Otherwise, the counter will be loaded with an incorrect count.

The Control Word Register at port 43h controls the operation of all three counters. Several commands are available:

- **Control Word Command.** Specifies which counter to read or write, the operating mode, and the count format (binary or BCD).
- **Counter Latch Command.** Latches the current count so that it can be read by the system. The countdown process continues.
- **Read Back Command.** Reads the count value, programmed mode, the current state of the OUT pins, and the state of the Null Count Flag of the selected counter.

Table 333 lists the six operating modes for the interval counters.

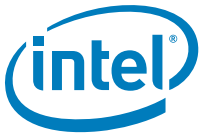
Table 333. Counter Operating Modes

Mode	Function	Description
0	Out signal on end of count (=0)	Output is 0. When count goes to 0, output goes to 1 and stays at 1 until counter is reprogrammed.
1	Hardware re-triggerable one-shot	Output is 0. When count goes to 0, output goes to 1 for one clock time.
2	Rate generator (divide by n counter)	Output is 1. Output goes to 0 for one clock time, then back to 1 and counter is reloaded.
3	Square wave output	Output is 1. Output goes to 0 when counter rolls over, and counter is reloaded. Output goes to 1 when counter rolls over, and counter is reloaded, etc.
4	Software triggered strobe	Output is 1. Output goes to 0 when count expires for one clock time.
5	Hardware triggered strobe	Output is 1. Output goes to 0 when count expires for one clock time.

37.3.2 Reading from the Interval Timer

It is often desirable to read the value of a counter without disturbing the count in progress. There are three methods for reading the counters: a simple read operation, counter Latch command, and the Read-Back command. Each is explained below.

With the simple read and counter latch command methods, the count must be read according to the programmed format; specifically, if the counter is programmed for two byte counts, two bytes must be read. The two bytes do not have to be read one right after the other. Read, write, or programming operations for other counters may be inserted between them.



37.3.2.1 Simple Read

The first method is to perform a simple read operation. The counter is selected through Port 40h (Counter 0), 41h (Counter 1), or 42h (Counter 2).

Note: Performing a direct read from the counter does not return a determinate value, because the counting process is asynchronous to read operations. However, in the case of Counter 2, the count can be stopped by writing 0b to the NSC.TC2E register bit.

37.3.2.2 Counter Latch Command

The Counter Latch command, written to Port 43h, latches the count of a specific counter at the time the command is received. This command is used to ensure that the count read from the counter is accurate, particularly when reading a two-byte count. The count value is then read from each counter's Count register as was programmed by the Control register.

The count is held in the latch until it is read or the counter is reprogrammed. The count is then unlatched. This allows reading the contents of the counters on the fly without affecting counting in progress. Multiple Counter Latch Commands may be used to latch more than one counter. Counter Latch commands do not affect the programmed mode of the counter in any way.

If a counter is latched and then, some time later, latched again before the count is read, the second Counter Latch command is ignored. The count read is the count at the time the first Counter Latch command was issued.

37.3.2.3 Read Back Command

The Read Back command, written to Port 43h, latches the count value, programmed mode, and current states of the OUT pin and Null Count flag of the selected counter or counters. The value of the counter and its status may then be read by I/O access to the counter address.

The Read Back command may be used to latch multiple counter outputs at one time. This single command is functionally equivalent to several counter latch commands, one for each counter latched. Each counter's latched count is held until it is read or reprogrammed. Once read, a counter is unlatched. The other counters remain latched until they are read. If multiple count Read Back commands are issued to the same counter without reading the count, all but the first are ignored.

The Read Back command may additionally be used to latch status information of selected counters. The status of a counter is accessed by a read from that counter's I/O port address. If multiple counter status latch operations are performed without reading the status, all but the first are ignored.

Both count and status of the selected counters may be latched simultaneously. This is functionally the same as issuing two consecutive, separate Read Back commands. If multiple count and/or status Read Back commands are issued to the same counters without any intervening reads, all but the first are ignored.

If both count and status of a counter are latched, the first read operation from that counter returns the latched status, regardless of which was latched first. The next one or two reads, depending on whether the counter is programmed for one or two type counts, returns the latched count. Subsequent reads return unlatched count.

37.4 Register Map

37.5 IO Mapped Registers

The IO ports listed in Table 334 have multiple register functions depending on the current programmed state of the 8254. The port numbers referenced in the register descriptions following Table 334 is one possible combination but not the only one.

Table 334. Register Aliases

Port	Alias	Register Name	Default Value	Access
40h	50h	Counter 0 Interval Time Status Byte Format (C0TS)	0xxxxxxxb	RO
		Counter 0 Counter Access Port Register (C0AP)	Undefined	RW
41h	51h	Counter 1 Interval Time Status Byte Format (C1TS)	0xxxxxxxb	RO
		Counter 1 Counter Access Port Register (C1AP)	Undefined	RW
42h	52h	Counter 2 Interval Time Status Byte Format (C2TS)	0xxxxxxxb	RO
		Counter 2 Counter Access Port Register (C2AP)	Undefined	RW
43h	-	Timer Control Word Register (TCW)	Undefined	WO
		Read Back Command (RBC)	xxxxxxx0b	WO

0	X RO	**CT:** Countdown Type: 0 for binary countdown or a 1 for binary coded decimal (BCD) countdown.

37.6.4 TCW—Offset 43h

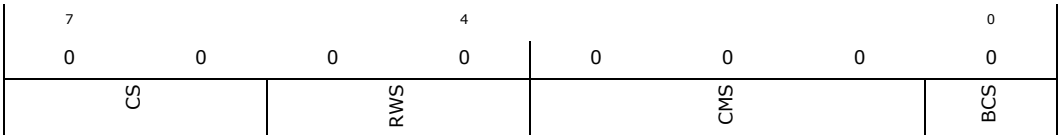
Timer Control Word Register. This register is programmed prior to any counter being accessed to specify counter modes. Following reset, the control words for each register are undefined and each counter output is 0. Each timer must be programmed to bring it into a known state.

Access Method

Type: I/O Register
(Size: 8 bits)

TCW: 43h

Default: 00h



Bit Range	Default & Access	Description
7:6	X WO	**CS:** Counter Select (CS): The Counter Selection bits select the counter the control word acts upon as shown below. The Read Back Command is selected when bits[7:6] are both 1 00 Counter 0 select 01 Counter 1 select 10 Counter 2 select 11 Read Back Command
5:4	X WO	**RWS:** Read/Write Select RWS): The counter programming is done through the counter port (40h for counter 0, 41h for counter 1, and 42h for counter 2) 00 Counter Latch Command 01 Read/Write Least Significant Byte (LSB) 10 Read/Write Most Significant Byte (MSB) 11 Read/Write LSB then MSB
3:1	X WO	**CMS:** Counter Mode Selection (CMS): Selects one of six modes of operation for the selected counter. 000 = Out signal on end of count (=0) 001 = Hardware retriggerable one-shot x10 = Rate generator (divide by n counter) x11 = Square wave output 100 = Software triggered strobe 101 = Hardware triggered strobe
0	X WO	**BCS:** Binary/BCD Countdown Select (BCS): 0 Binary countdown is used. The largest possible binary count is 216 1 Binary coded decimal (BCD) count is used. The largest possible BCD count is 104

37.6.5 C0AP—Offset 50h

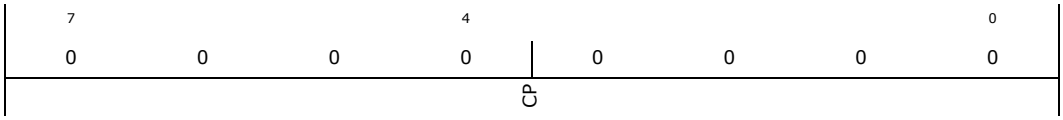
Counter 0 Counter Access Port Register

Access Method

Type: I/O Register
(Size: 8 bits)

C0AP: 50h

Default: 00h



Bit Range	Default & Access	Description
7:0	X RW	**CP:** Counter Port: Each counter port address is used to program the 16-bit Count Register. The order of programming, either LSB only, MSB only, or LSB then MSB, is defined with the Interval Counter Control Register at port 43h. The counter port is also used to read the current count from the Count Register, and return the status of the counter programming following a Read Back Command.

37.6.6 C1AP—Offset 51h

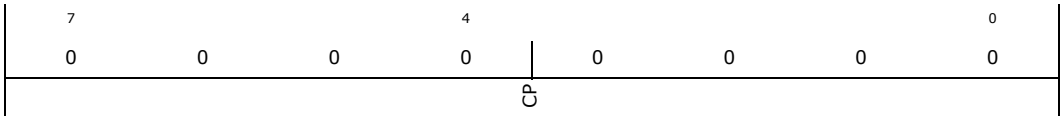
Counter 1 Counter Access Port Register

Access Method

Type: I/O Register
(Size: 8 bits)

C1AP: 51h

Default: 00h



Bit Range	Default & Access	Description
7:0	X RW	**CP:** Counter Port: Each counter port address is used to program the 16-bit Count Register. The order of programming, either LSB only, MSB only, or LSB then MSB, is defined with the Interval Counter Control Register at port 43h. The counter port is also used to read the current count from the Count Register, and return the status of the counter programming following a Read Back Command.

37.6.7 C2AP—Offset 52h

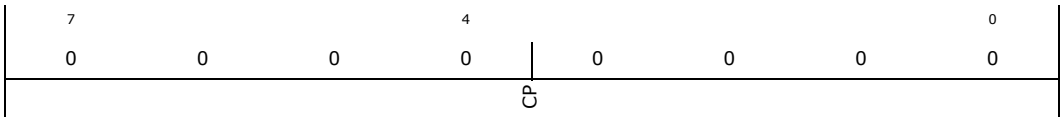
Counter 2 Counter Access Port Register

Access Method

Type: I/O Register
(Size: 8 bits)

C2AP: 52h

Default: 00h



Bit Range	Default & Access	Description
7:0	X RW	**CP:** Counter Port: Each counter port address is used to program the 16-bit Count Register. The order of programming, either LSB only, MSB only, or LSB then MSB, is defined with the Interval Counter Control Register at port 43h. The counter port is also used to read the current count from the Count Register, and return the status of the counter programming following a Read Back Command.

37.6.8 NSC—Offset 61h

NMI Status and Control

Access Method

Type: I/O Register
(Size: 8 bits)

NSC: 61h

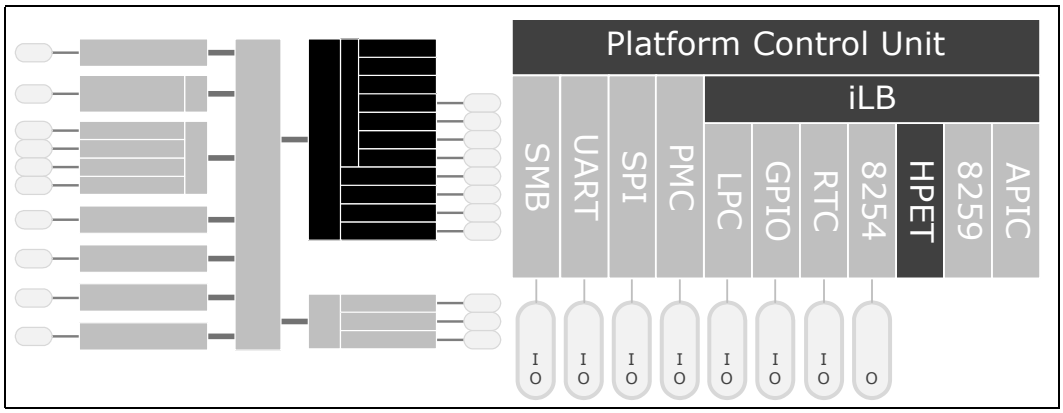
Default: 20h

7			4				0
0	0	1	0	0	0	0	0
SNS	INS	T2S	RTS	INE	SNE	SDE	TC2E

Bit Range	Default & Access	Description
7	0b RO	**SNS:** SERR# NMI Status (SNS): Set on errors from a PCIe port or internal functions that generate SERR#. SNE in this register must be cleared in order for this bit to be set. To reset the interrupt, set bit 2 to 1 and then set it to 0.
6	0b RO	**INS:** IOCHK NMI Status (INS): Set when SERIRQ asserts IOCHK# and INE in this register is cleared. To reset the interrupt, set bit 3 to 1 and then set it to 0.
5	1b RO	**RTS (T2S):** Timer Counter 2 Status (T2S): Reflects the current state of the 8254 counter 2 outputs. Counter 2 must be programmed for this bit to have a determinate value.
4	0b RO	**RTS:** Refresh Cycle Toggle Status (RTS): Reflects the current state of 8254 counter 1
3	X RW	**INE:** IOCHK NMI Enable (INE): When set, IOCHK# NMIs are disabled. When cleared, IOCHK# NMIs are enabled.
2	0b RW	**SNE:** SERR# NMI Enable (SNE): When set, SERR# NMIs are disabled. When cleared, SERR# NMIs are enabled.
1	0b RW	**SDE:** Speaker Data Enable (SDE): When this bit is a 0, the SPKR output is a 0. When this bit is a 1, the SPKR output is equivalent to the Counter 2 OUT signal value.
0	0b RW	**TC2E:** Timer Counter 2 Enable (TC2E): When cleared, counter 2 counting is disabled. When set, counting is enabled.

38 PCU – iLB – High Precision Event Timer (HPET)

This function provides a set of timers that to be used by the operating system for timing events. One timer block is implemented, containing one counter and three timers.



38.1 Features

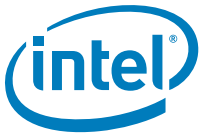
38.1.1 Non-Periodic Mode - All Timers

This mode can be thought of as creating a one-shot. When a timer is set up for non-periodic mode, it generates an interrupt when the value in the main counter matches the value in the timer's comparator register. As timers 1 and 2 are 32-bit, they will generate another interrupt when the main counter wraps.

T0CV cannot be programmed reliably by a single 64-bit write in a 32-bit environment unless only the periodic rate is being changed. If T0CV needs to be re-initialized, the following algorithm is performed:

1. Set T0C.TVS
2. Set T0CV[31:0]
3. Set T0C.TVS
4. Set T0CV[63:32]

Every timer is required to support the non-periodic mode of operation.



38.1.2 Periodic Mode - Timer 0 only

When set up for periodic mode, when the main counter value matches the value in T0CV, an interrupt is generated (if enabled). Hardware then increases T0CV by the last value written to T0CV. During run-time, T0CV can be read to find out when the next periodic interrupt will be generated. Software is expected to remember the last value written to T0CV.

Example: if the value written to T0CV is 00000123h, then

- An interrupt will be generated when the main counter reaches 00000123h.
- T0CV will then be adjusted to 00000246h.
- Another interrupt will be generated when the main counter reaches 00000246h.
- T0CV will then be adjusted to 00000369h.

When the incremented value is greater than the maximum value possible for T0CV, the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h.

If software wants to change the periodic rate, it writes a new value to T0CV. When the timer's comparator matches, the new value is added to derive the next matching point. If software resets the main counter, the value in the comparator's value register must also be reset by setting T0C.TVS. To avoid race conditions, this should be done with the main counter halted. The following usage model is expected:

1. Software clears GCFG.EN to prevent any interrupts.
2. Software clears the main counter by writing a value of 00h to it.
3. Software sets T0C.TVS.
4. Software writes the new value in T0CV.
5. Software sets GCFG.EN to enable interrupts.

38.1.2.1 Interrupts

If each timer has a unique interrupt and the timer has been configured for edge-triggered mode, then there are no specific steps required. If configured to level-triggered mode, then its interrupt must be cleared by software by writing a '1' back to the bit position for the interrupt to be cleared.

Interrupts associated with the various timers have several interrupt mapping options. Software should mask GCFG.LRE when reprogramming HPET interrupt routing to avoid spurious interrupts.

38.1.2.2 Mapping Option #1: Legacy Option (GCFG.LRE set)

This forces the following mapping:

Table 336. 8254 Interrupt Mapping

Timer	8259 Mapping	APIC Mapping	Comment
0	IRQ0	IRQ2	The 8254 timer will not cause any interrupts
1	IRQ8	IRQ8	RTC will not cause any interrupts.
2	T2C.IR	T2C.IRC	

38.1.2.3 Mapping Option #2: Standard Option (GCFG.LRE cleared)

Each timer has its own routing control. The interrupts can be routed to various interrupts in the I/O APIC. T[2:0]C.IRC indicates which interrupts are valid options for routing. If a timer is set for edge-triggered mode, the timers should not be shared with any other interrupts.

38.5.1 GCID (HPET_GCID)—Offset FED00000h

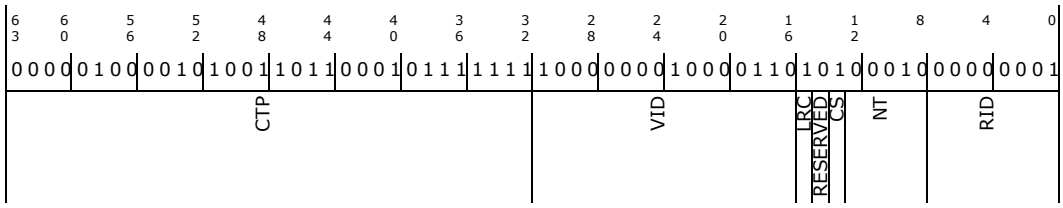
General Capabilities and ID

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

HPET_GCID: FED00000h

Default: 0429B17F8086A201h



Bit Range	Default & Access	Description
63:32	0429B17Fh RO	**CTP:** Counter Tick Period (CTP): Indicates a period of 69.841279ns, (14.1318 MHz clock period)
31:16	8086h RO	**VID:** Vendor ID (VID): Value of 8086h indicates Intel.
15	1b RO	**LRC:** Legacy Rout Capable (LRC): Indicates support for Legacy Interrupt Rout.
14	0b RO	**RESERVED:** Reserved.
13	1b RO	**CS:** Counter Size (CS): This bit is set to indicate that the main counter is 64 bits wide.

Bit Range	Default & Access	Description
12:8	02h RO	**NT:** Number of Timers (NT): Indicates that 3 timers are supported.
7:0	01h RO	**RID:** Revision ID (RID): Indicates that revision 1.0 of the specification is implemented.

38.5.2 GCFG (HPET_GCFG)—Offset FED00010h

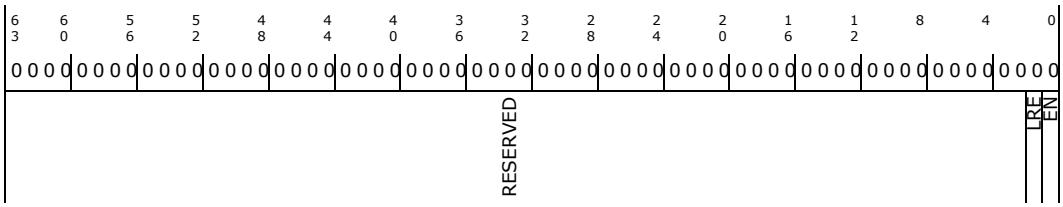
General Configuration

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

HPET_GCFG: FED00010h

Default: 0000000000000000h



Bit Range	Default & Access	Description
63:2	0b RO	**RESERVED:** Reserved.
1	0b RW	**LRE:** Legacy Rout Enable (LRE): When set, interrupts will be routed as follows: Timer 0 will be routed to IRQ0 in 8259 or IRQ2 in the I/O APIC Timer 1 will be routed to IRQ8 in 8259 and I/O APIC Timer 2 will be routed as per the routing in T2C When set, the T[1:0]C.IR will have no impact for timers 0 and 1.
0	0b RW	**EN:** Overall Enable (EN): When set, the timers can generate interrupts. When cleared, the main counter will halt and no interrupts will be caused by any timer. For level-triggered interrupts, if an interrupt is pending when this bit is cleared, the GIS.Tx will not be cleared.

38.5.3 GIS (HPET_GIS)—Offset FED00020h

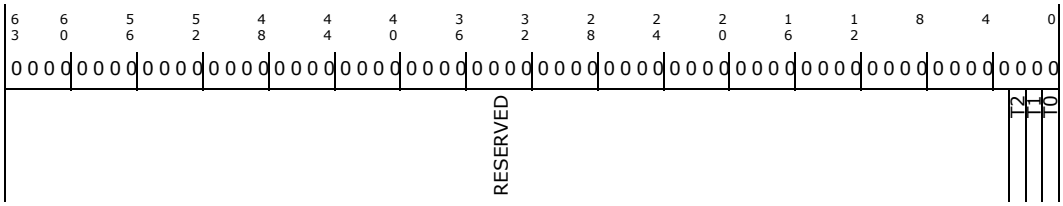
General Interrupt Status

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

HPET_GIS: FED00020h

Default: 0000000000000000h



Bit Range	Default & Access	Description
63:3	0b RO	**RESERVED:** Reserved.
2	0b RW	**T2:** Timer 2 Status (T2): Same functionality as T0, for timer 2.
1	0b RW	**T1:** Timer 1 Status (T1): Same functionality as T0, for timer 1.
0	0b RW	**T0:** Timer 0 Status (T0): In edge triggered mode, this bit always reads as 0. In level triggered mode, this bit is set when an interrupt is active.

38.5.4 MCV (HPET_MCV)—Offset FED000F0h

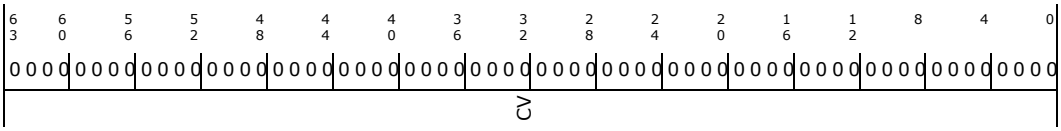
Main Counter Value

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

HPET_MCV: FED000F0h

Default: 0000000000000000h



Bit Range	Default & Access	Description
63:0	0b RW	**CV:** Counter Value (CV): Reads return the current value of the counter. Writes load the new value to the counter. Timers 1 and 2 return 0 for the upper 32-bits of this register.

38.5.5 T0C (HPET_T0C)—Offset FED00100h

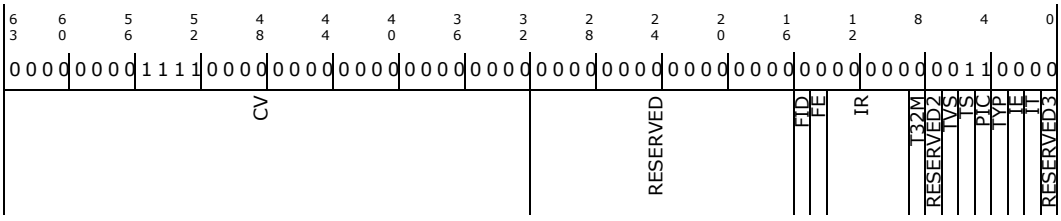
Timer 0 Config and Capabilities

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

HPET_T0C: FED00100h

Default: 00F0000000000030h



Bit Range	Default & Access	Description
63:32	00f00000h RO	**IRC (CV):** Interrupt Rout Capability (IRC): Indicates I/OxAPIC interrupts the timer can use: Timer 0,1: 00f00000h. Indicates support for IRQ20, 21, 22, 23 Timer 2: 00f00800h. Indicates support for IRQ11, 20, 21, 22, and 23

Bit Range	Default & Access	Description
31:16	0h RO	**RESERVED:** Reserved.
15	0b RO	**FID:** FSB Interrupt Delivery (FID): Not supported
14	0b RO	**FE:** FSB Enable (FE): Not supported, since FID is not supported.
13:9	0b RW	**IR:** Interrupt Rout (IR): Indicates the routing for the interrupt to the IOxAPIC. If the value is not supported by this prarticular timer, the value read back will not match what is written. If GCFG.LRE is set, then Timers 0 and 1 have a fixed routing, and this field has no effect.
8	0b RW	**T32M:** Timer 32-bit Mode (T32M): When set, this bit forces a 64-bit timer to behave as a 32-bit timer. For timer 0, this bit will be read/write and default to 0. For timers 1 and 2, this bit is read only '0'.
7	0b RO	**RESERVED (RESERVED2):** Timer 32-bit Mode (T32M): When set, this bit forces a 64-bit timer to behave as a 32-bit timer. For timer 0, this bit will be read/write and default to 0. For timers 1 and 2, this bit is read only '0'.
6	0b RW	**TVS:** Timer Value Set (TVS): This bit will return 0 when read. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1 and 2.
5	1b RO	**TS:** Timer Size (TS): 1 = 64-bits, 0 = 32-bits. Set for timer 0. Cleared for timers 1 and 2.
4	1b RO	**PIC:** Periodic Interrupt Capable (PIC): When set, hardware supports a periodic mode for this timer's interrupt. This bit is set for timer 0, and cleared for timers 1 and 2.
3	0b RW	**TYP:** Timer Type (TYP): If PIC is set, this bit is read/write, and can be used to enable the timer to generate a periodic interrupt. This bit is RW for timer 0, and RO for timers 1 and 2.
2	0b RW	**IE:** Interrupt Enable (IE): When set, enables the timer to cause an interrupt when it times out. When cleared, the timer count and generates status bits, but will not cause an interrupt.
1	0b RW	**IT:** Timer Interrupt Type (IT): When cleared, interrupt is edge triggered. When set, interrupt is level triggered and will be held active until it is cleared by writing 1 to GIS.Tn. If another interrupt occurs before the interrupt is cleared, the interrupt remains active.
0	0b RO	**RESERVED (RESERVED3):** Reserved.

38.5.6 T0CV_L (HPET_T0CV_L)—Offset FED00108h

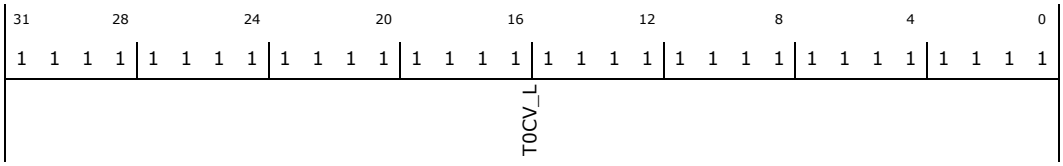
Lower Timer 0 Comperator Value

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

HPET_T0CV_L: FED00108h

Default: FFFFFFFFh



Bit Range	Default & Access	Description
31:0	FFFFFFFFh RW	**T0CV_L:** Lower Timer 0 Comperator Value

38.5.7 T0CV_U (HPET_T0CV_U)—Offset FED0010Ch

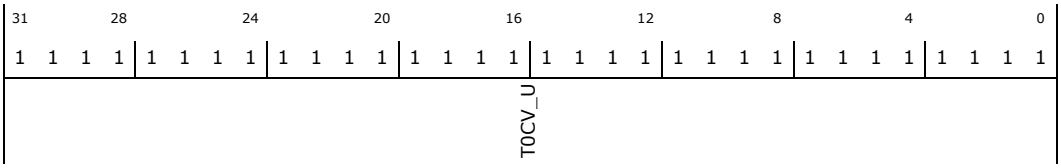
Upper Timer 0 Comperator Value

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

HPET_T0CV_U: FED0010Ch

Default: FFFFFFFFh



Bit Range	Default & Access	Description
31:0	FFFFFFFFh RW	**T0CV_U:** Upper Timer 0 Comperator Value

38.5.8 T1C (HPET_T1C)—Offset FED00120h

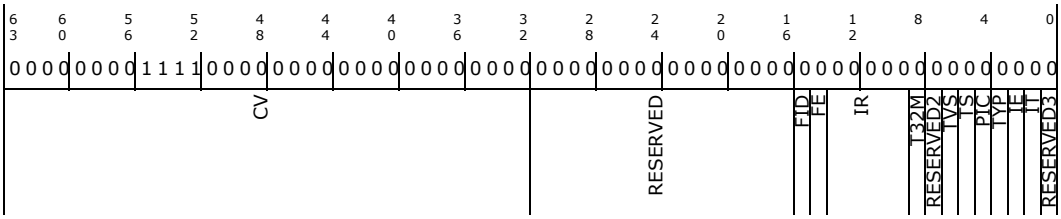
Timer 1 Config and Capabilities

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

HPET_T1C: FED00120h

Default: 00F0000000000000h



Bit Range	Default & Access	Description
63:32	00f00000h RO	**IRC (CV):** Interrupt Rout Capability (IRC): Indicates I/OxAPIC interrupts the timer can use: Timer 0,1: 00f00000h. Indicates support for IRQ20, 21, 22, 23 Timer 2: 00f00800h. Indicates support for IRQ11, 20, 21, 22, and 23
31:16	0h RO	**RESERVED:** Reserved.
15	0b RO	**FID:** FSB Interrupt Delivery (FID): Not supported

Bit Range	Default & Access	Description
14	0b RO	**FE:** FSB Enable (FE): Not supported, since FID is not supported.
13:9	0b RW	**IR:** Interrupt Rout (IR): Indicates the routing for the interrupt to the IOxAPIC. If the value is not supported by this prarticular timer, the value read back will not match what is written. If GCFG.LRE is set, then Timers 0 and 1 have a fixed routing, and this field has no effect.
8	0b RO	**T32M:** Timer 32-bit Mode (T32M): When set, this bit forces a 64-bit timer to behave as a 32-bit timer. For timer 0, this bit will be read/write and default to 0. For timers 1 and 2, this bit is read only '0'.
7	0b RO	**RESERVED (RESERVED2):** Timer 32-bit Mode (T32M): When set, this bit forces a 64-bit timer to behave as a 32-bit timer. For timer 0, this bit will be read/write and default to 0. For timers 1 and 2, this bit is read only '0'.
6	0b RO	**TVS:** Timer Value Set (TVS): This bit will return 0 when read. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1 and 2.
5	0b RO	**TS:** Timer Size (TS): 1 = 64-bits, 0 = 32-bits. Set for timer 0. Cleared for timers 1 and 2.
4	0b RO	**PIC:** Periodic Interrupt Capable (PIC): When set, hardware supports a periodic mode for this timer's interrupt. This bit is set for timer 0, and cleared for timers 1 and 2.
3	0b RO	**TYP:** Timer Type (TYP): If PIC is set, this bit is read/write, and can be used to enable the timer to generate a periodic interrupt. This bit is RW for timer 0, and RO for timers 1 and 2.
2	0b RW	**IE:** Interrupt Enable (IE): When set, enables the timer to cause an interrupt when it times out. When cleared, the timer count and generates status bits, but will not cause an interrupt.
1	0b RW	**IT:** Timer Interrupt Type (IT): When cleared, interrupt is edge triggered. When set, interrupt is level triggered and will be held active until it is cleared by writing 1 to GIS.Tn. If another interrupt occurs before the interrupt is cleared, the interrupt remains active.
0	0b RO	**RESERVED (RESERVED3):** Reserved.

38.5.9 T1CV (HPET_T1CV)—Offset FED00128h

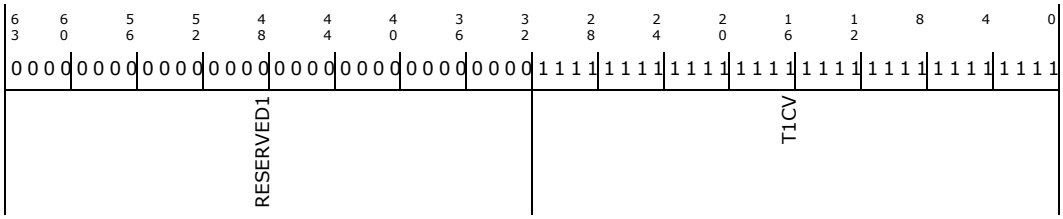
Timer 1 Comperator Value

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

HPET_T1CV: FED00128h

Default: 00000000FFFFFFFFh



Bit Range	Default & Access	Description
63:32	0b RO	**RESERVED (RESERVED1):** Reserved.

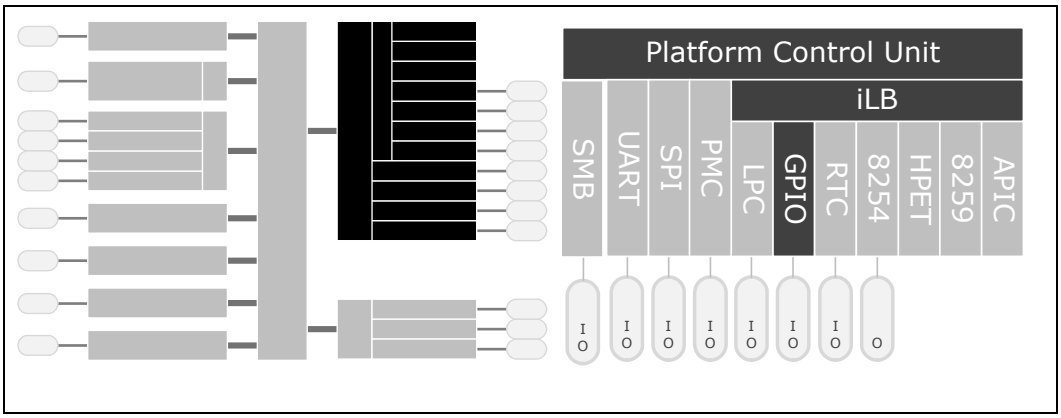
39 PCU – iLB – GPIO

102 GPIOs are available for use during the S0 ACPI state, and 44 are available for use from S5 to S0 (SUS). Most of these GPIOs can be used as legacy GPIOs through IO registers.



39.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane
- **Description**: A brief explanation of the signal's function

Table 338. GPIO Signals

Signal Name	Direction Plat. Power	Description
GPIO_S0_SC[101:0]	I/O Varies	These GPIO pins are powered and active in S0 only. Many of these are multiplexed with other functions and may have different default pin names.
GPIO_S5[43:0]	I/O Varies	These GPIO pins are powered and active in S5-S0 (SUS). Many of these are multiplexed with other functions and may have different default pin names. Some are used as straps.

39.2 Features

GPIOs can generate general purpose events (GPEs) on rising and/or falling edges.

39.3 Legacy Use

Each GPIO has six registers that control how it is used, or report its status:

- Use Select
- I/O Select
- GPIO Level
- Trigger Positive Edge
- Trigger Negative Edge
- Trigger Status

The Use Select register selects a GPIO pin as a GPIO, or leaves it as its programmed function. This register must be set for all other registers to affect the GPIO.

The I/O Select register determines the direction of the GPIO.

The Trigger Positive Edge and Trigger Negative Edge registers enable general purpose events on a rising and falling edge respectively. This only applies to GPIOs set as input.

The Trigger Status register is used by software to determine if the GPIO triggered a GPE. This only applies to GPIOs set as input and with one or both of the Trigger modes enabled.

Additionally, there is one additional register for each S5 GPIO:

- Wake Enable

This register allows S5 GPIOs to trigger a wake event based on the Trigger registers' settings.

39.4 Memory Mapped Use

Each GPIO has two registers that control how it is used, or report its status:

- Pad Configuration (PCONF0)
- Pad Value (PAD_VAL)

Note: These registers are also implemented for the available Virtual GPIOs (vGPIOs).

The Pad Configuration register has the following functions:

- Configure the function of the pin as a GPIO or mulitplexed native functions
- Configure pull resistors
- Configure electrical behavior
- Configure edge detection
- Configure interrupt handling

Note: The PCONF0 register is valid irrespective of whether or not the pin is conifgured as a GPIO

The Pad Value register has the following functions:

- Reads the GPIO value, when configured as a GPI
- Writes the GPIO value, when configured as a GPO
- Enables/disables input and output capabilities

Note: The Pad Value register is only valid when the pin is configured as a GPIO in the Pad Configuration register.

Additionally, there are a number of general configuration registers that control groups of GPIOs or report their status. These include:

- IRQ Status (IRQ_TS)
- Direct IRQ Multiplexer (DIRECT_IRQ)

The IRQ Status register indicates if an IRQ associated with a GPIO has been triggered.

The Direct IRQ Multiplexer register allows for a selection of GPIOs to be assigned a dedicated APIC interrupt.

The GPIO South CORE and GPIO South SUS families have 16 dedicated IRQ outputs for each. Each of these 16 has a mux with an 8 bit select that can pick which of the input pads are mapped to that direct IRQ (the pad would still need to be programmed). Refer to the Intel Bios Writers Guide. This programming is done with the Direct IRQ 0 - 3 registers for SCORE and SSUS domains listed in the GPIO Family Register section.

The 16 GPSCORE direct IRQs are mapped to `IOAPIC_IRQ [66:51]`.

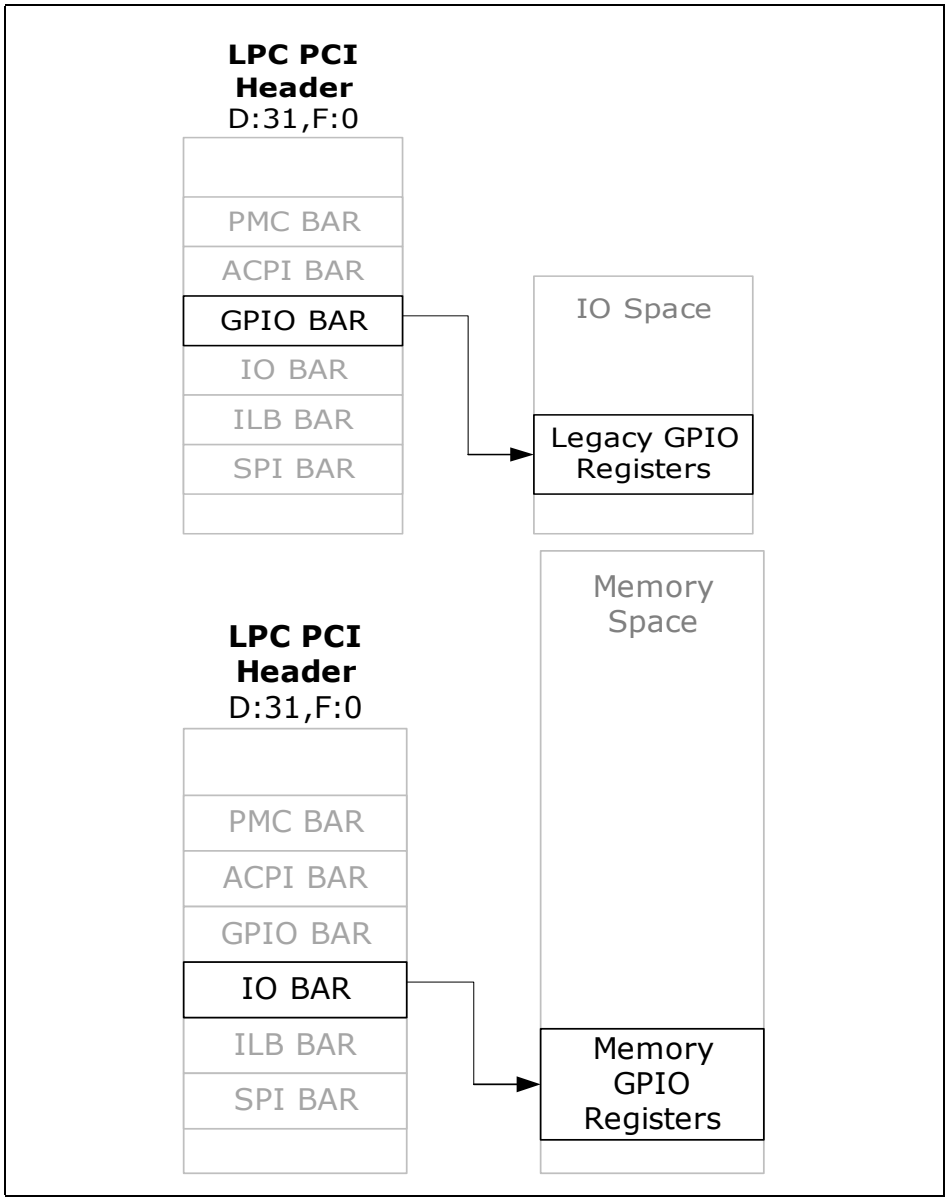
The 16 GPSSUS direct IRQs are mapped to `IOAPIC_IRQ [82:67]`.

For example:

1. Programming GPSCORE Direct IRQ 0 [dirq0] = 4 will map GPIO_S0_SC[004]/ pCIE_CLKREQ[1#] to IRQ51.
2. Programming GPSCORE Direct IRQ 0 [dirq1] = 8 will map GPIO_S0_SC[008]/ I2S0_CLK to IRQ52.

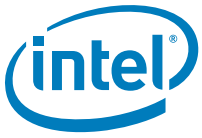
39.5 Register Map

Figure 137.SIO - I2C Register Map



39.6 GPIO Registers

Registers are broken into two groups: memory mapped and legacy IO registers. Memory mapped registers are used by BIOS and firmware to select the configurable function of the GPIO and setup analog states needed for that function's operation. They



are named based on the pin/ball name. Legacy IO registers are the more traditional GPIO control/status type, and are used when the function selected is a traditional GPIO (direction, level, use registers). They are numbered based on the GPIO number.

Each group is further broken down into SCORE (internal partition naming) and SSUS. SCORE are for the GPIO's named GPIO_S0_SC[xxx], while SSUS are for the GPIO's named GPIO_S5[xx].

Note: All GPIO registers must be accessed as double words. Unpredictable results will occur otherwise.

Note: All memory mapped GPIO *_PAD_VAL's must set Ienenb = 0 in order to read the pad_val of the GPIO. This applies to RO GPIO's as well.

Note: vGPIO's are virtual GPIO's for use by software to generate interrupts. They are not tied to physical pins.

Note: When a GPIO is selected via the IO USE_SEL, Memory accesses are denied (pconf0, pconf1 and pad_val).

39.7.1 South Core Use Select 1 (cfio_ioreg_SC_USE_SEL_31_0_)—Offset 0h

Access via PCU proxy, the register is setting the corresponding GPIO to be selected and to be changed to IO access instead of the default Memory access. Bit 0 will set GPIO[0], and bit 1 will set GPIO[1] and so on. The default of IO GPIO pad is input so pull must be activated in the pad pconf0 register.

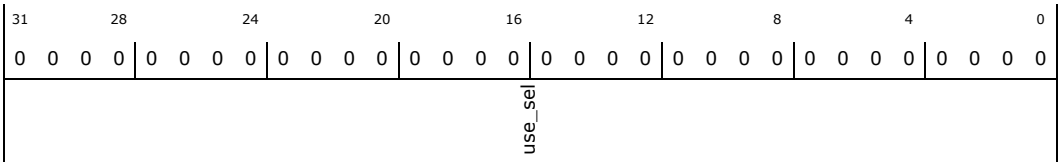
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE] + 0h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000 00000000 00000000 00000b RW	**Use Select (use_sel):** bit 31 - SDMMC2_D3_CD_B bit 30 - SDMMC2_D2 bit 29 - SDMMC2_D1 bit 28 - SDMMC2_D0 bit 27 - SDMMC2_CLK bit 26 - MMC1_RESET_B bit 25 - SDMMC1_CMD bit 24 - MMC1_D7 bit 23 - MMC1_D6 bit 22 - MMC1_D5 bit 21 - MMC1_D4_SD_WE bit 20 - SDMMC1_D3_CD_B bit 19 - SDMMC1_D2 bit 18 - SDMMC1_D1 bit 17 - SDMMC1_D0 bit 16 - SDMMC1_CLK bit 15 - HDA_DOCKENB bit 14 - HDA_DOCKRSTB bit 13 - HDA_SDI1 bit 12 - HDA_SDI0 bit 11 - HDA_SDO bit 10 - HDA_CLK bit 9 - HDA_SYNC bit 8 - HDA_RSTB bit 7 - PCIE_CLKREQ4B bit 6 - PCIE_CLKREQ3B bit 5 - PCIE_CLKREQ2B bit 4 - PCIE_CLKREQ1B bit 3 - PCIE_CLKREQ0B bit 2 - SATA_LEDN bit 1 - SATA_GP1 bit 0 - SATA_GP0

39.7.2 South Core Io Select 1 (cfio_ioreg_SC_IO_SEL_31_0_)—Offset 4h

Access via PCU proxy, define the Input Output Select: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO_USE_SEL register) is programmed as an input. When set to 0, the GPIO signal is programmed as an output - Only the 8 lsb are used in VLV. Default values will be read as 0 if IO is not used

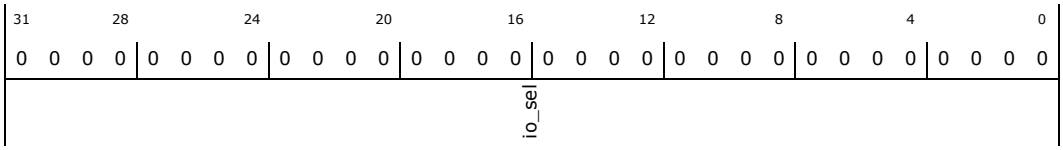
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE] + 4h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000000000000000000000000000b RW	**Io Select (io_sel):** bit 31 - SDMMC2_D3_CD_B bit 30 - SDMMC2_D2 bit 29 - SDMMC2_D1 bit 28 - SDMMC2_D0 bit 27 - SDMMC2_CLK bit 26 - MMC1_RESET_B bit 25 - SDMMC1_CMD bit 24 - MMC1_D7 bit 23 - MMC1_D6 bit 22 - MMC1_D5 bit 21 - MMC1_D4_SD_WE bit 20 - SDMMC1_D3_CD_B bit 19 - SDMMC1_D2 bit 18 - SDMMC1_D1 bit 17 - SDMMC1_D0 bit 16 - SDMMC1_CLK bit 15 - HDA_DOCKENB bit 14 - HDA_DOCKRSTB bit 13 - HDA_SDI1 bit 12 - HDA_SDI0 bit 11 - HDA_SDO bit 10 - HDA_CLK bit 9 - HDA_SYNC bit 8 - HDA_RSTB bit 7 - PCIE_CLKREQ4B bit 6 - PCIE_CLKREQ3B bit 5 - PCIE_CLKREQ2B bit 4 - PCIE_CLKREQ1B bit 3 - PCIE_CLKREQ0B bit 2 - SATA_LEDN bit 1 - SATA_GP1 bit 0 - SATA_GP0

39.7.3 South Core Gpio Level 1 (cfio_ioreg_SC_GP_LVL_31_0_)—Offset 8h

Access via PCU proxy, the registers are implemented as dual read/write with dedicated storage for write. Write value will be stored in the write register, while read is coming from the pad directly. If GPIO(n) is programmed to be an output (via the corresponding bit in the GP_IO_SEL register), then the corresponding GP_LVL(n) write register value will drive a high or low value on the output pin. 1 = high, 0 = low. - Only the 8 lsb are used in VLV

Access Method

Type: I/O Register (Size: 32 bits)

39.7.6 South Core Trigger Status 1 (cfio_ioreg_SC_TS_31_0_)—Offset 14h

Access via PCU proxy, when set to a 1, the corresponding GPIO (if enabled in the GPIO_USE_SEL register) if enabled as input via IO_SEL(n), triggered an GPE or SMI. This will be set if a 0 to 1 transition occurred and TPE(n) was set, or a 1 to 0 transition occurred and TNE(n) was set. If both TPE(n) and TNE(n) are set, then this bit will be set on both a 0 to 1 and a 1 to 0 transition. This bit will not be set if the GPIO is configured as an output. - Only the 8 lsb are used in VLV and it cannot be tested by the host

Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE] + 14h

GBASE Type: PCI Configuration Register (Size: 32 bits)

31:0	00000000000000000000000000000000b RW	**Use Select (use_sel):** bit 31 - PWM1 bit 30 - PWM0 bit 29 - I2C_NFC_SCL bit 28 - I2C_NFC_SDA bit 27 - I2C6_SCL bit 26 - I2C6_SDA bit 25 - I2C5_SCL bit 24 - I2C5_SDA bit 23 - I2C4_SCL bit 22 - I2C4_SDA bit 21 - I2C3_SCL bit 20 - I2C3_SDA bit 19 - I2C2_SCL bit 18 - I2C2_SDA bit 17 - I2C1_SCL bit 16 - I2C1_SDA bit 15 - I2C0_SCL bit 14 - I2C0_SDA bit 13 - UART2_CTS_B bit 12 - UART2_RTS_B bit 11 - UART2_TXD bit 10 - UART2_RXD bit 9 - UART1_CTS_B bit 8 - UART1_RTS_B bit 7 - UART1_TXD bit 6 - UART1_RXD bit 5 - SPI1_CLK bit 4 - SPI1_MOSI bit 3 - SPI1_MISO bit 2 - SPI1_CS0_B bit 1 - GP_SSP_2_TXD bit 0 - GP_SSP_2_RXD

39.7.14 South Core Io Select 3 (cfio_ioreg_SC_IO_SEL_95_64_)—Offset 44h

Access via PCU proxy, it defines Input Output Select: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO_USE_SEL register) is programmed as an input. When set to 0, the GPIO signal is programmed as an output - Only the 8 lsb are used in VLV. Default values will be read as 0 if IO is not used

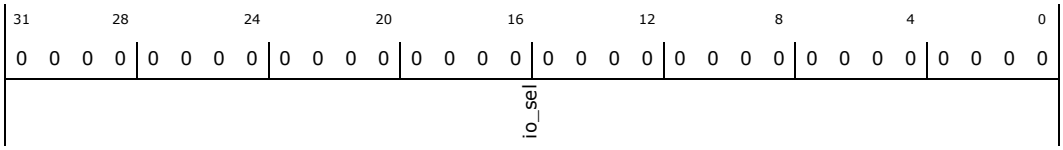
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE] + 44h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000 00000000 00000000 00000b RW	**Io Select (io_sel):** bit 31 - PWM1 bit 30 - PWM0 bit 29 - I2C_NFC_SCL bit 28 - I2C_NFC_SDA bit 27 - I2C6_SCL bit 26 - I2C6_SDA bit 25 - I2C5_SCL bit 24 - I2C5_SDA bit 23 - I2C4_SCL bit 22 - I2C4_SDA bit 21 - I2C3_SCL bit 20 - I2C3_SDA bit 19 - I2C2_SCL bit 18 - I2C2_SDA bit 17 - I2C1_SCL bit 16 - I2C1_SDA bit 15 - I2C0_SCL bit 14 - I2C0_SDA bit 13 - UART2_CTS_B bit 12 - UART2_RTS_B bit 11 - UART2_TXD bit 10 - UART2_RXD bit 9 - UART1_CTS_B bit 8 - UART1_RTS_B bit 7 - UART1_TXD bit 6 - UART1_RXD bit 5 - SPI1_CLK bit 4 - SPI1_MOSI bit 3 - SPI1_MISO bit 2 - SPI1_CS0_B bit 1 - GP_SSP_2_TXD bit 0 - GP_SSP_2_RXD

39.7.15 South Core Gpio Level 3 (cfio_ioreg_SC_GP_LVL_95_64_)—Offset 48h

This registers are implemented as dual read/write with dedicated storage for write. Write value will be stored in the write register, while read is coming from the pad directly. If GPIO(n) is programmed to be an output (via the corresponding bit in the GP_IO_SEL register), then the corresponding GP_LVL(n) write register value will drive a high or low value on the output pin. 1 = high, 0 = low. - Only the 8 lsb are used in VLV

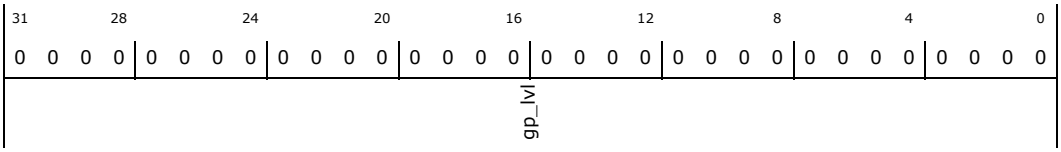
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE] + 48h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000 00000000 00000000 00000b RW	**Gpio Level (gp_lvl):** bit 31 - PWM1 bit 30 - PWM0 bit 29 - I2C_NFC_SCL bit 28 - I2C_NFC_SDA bit 27 - I2C6_SCL bit 26 - I2C6_SDA bit 25 - I2C5_SCL bit 24 - I2C5_SDA bit 23 - I2C4_SCL bit 22 - I2C4_SDA bit 21 - I2C3_SCL bit 20 - I2C3_SDA bit 19 - I2C2_SCL bit 18 - I2C2_SDA bit 17 - I2C1_SCL bit 16 - I2C1_SDA bit 15 - I2C0_SCL bit 14 - I2C0_SDA bit 13 - UART2_CTS_B bit 12 - UART2_RTS_B bit 11 - UART2_TXD bit 10 - UART2_RXD bit 9 - UART1_CTS_B bit 8 - UART1_RTS_B bit 7 - UART1_TXD bit 6 - UART1_RXD bit 5 - SPI1_CLK bit 4 - SPI1_MOSI bit 3 - SPI1_MISO bit 2 - SPI1_CS0_B bit 1 - GP_SSP_2_TXD bit 0 - GP_SSP_2_RXD

39.7.16 South Core Trigger Positive Edge Enable 3 (cfio_ioreg_SC_TPE_95_64_)—Offset 4Ch

Access via PCU proxy, the register trigger Positive Edge Enable: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO_USE_SEL register) will case an GPE or SMI when a 0 to 1 transition occurs. When set to 0, the GPIO signal is not enabled to trigger an GPE or SMI on a 0 to 1 transition. - Only the 8 lsb are used in VLV

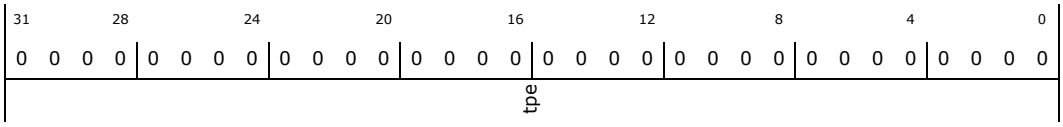
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE] + 4Ch

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000 00000000 00000000 00000b RW	**Tpe (tpe):** bit 31 - PWM1 bit 30 - PWM0 bit 29 - I2C_NFC_SCL bit 28 - I2C_NFC_SDA bit 27 - I2C6_SCL bit 26 - I2C6_SDA bit 25 - I2C5_SCL bit 24 - I2C5_SDA bit 23 - I2C4_SCL bit 22 - I2C4_SDA bit 21 - I2C3_SCL bit 20 - I2C3_SDA bit 19 - I2C2_SCL bit 18 - I2C2_SDA bit 17 - I2C1_SCL bit 16 - I2C1_SDA bit 15 - I2C0_SCL bit 14 - I2C0_SDA bit 13 - UART2_CTS_B bit 12 - UART2_RTS_B bit 11 - UART2_TXD bit 10 - UART2_RXD bit 9 - UART1_CTS_B bit 8 - UART1_RTS_B bit 7 - UART1_TXD bit 6 - UART1_RXD bit 5 - SPI1_CLK bit 4 - SPI1_MOSI bit 3 - SPI1_MISO bit 2 - SPI1_CS0_B bit 1 - GP_SSP_2_TXD bit 0 - GP_SSP_2_RXD

39.7.17 South Core Trigger Negative Enable 3 (cfio_ioreg_SC_TNE_95_64_)—Offset 50h

Access via PCU proxy, the register trigger Negative Edge Enable: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO_USE_SEL register) will case an GPE or SMI when a 1 to 0 transition occurs. When set to 0, the GPIO signal is not enabled to trigger an GPE or SMI on a 1 to 0 transition. - Only the 8 lsb are used in VLV

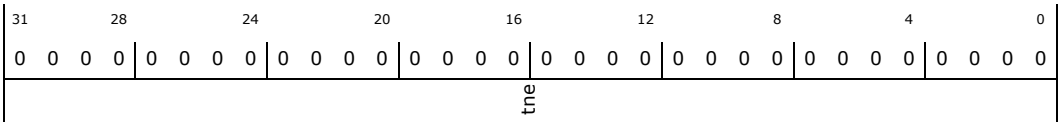
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE] + 50h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000 00000000 00000000 00000b RW	**Tne (tne):** bit 31 - PWM1 bit 30 - PWM0 bit 29 - I2C_NFC_SCL bit 28 - I2C_NFC_SDA bit 27 - I2C6_SCL bit 26 - I2C6_SDA bit 25 - I2C5_SCL bit 24 - I2C5_SDA bit 23 - I2C4_SCL bit 22 - I2C4_SDA bit 21 - I2C3_SCL bit 20 - I2C3_SDA bit 19 - I2C2_SCL bit 18 - I2C2_SDA bit 17 - I2C1_SCL bit 16 - I2C1_SDA bit 15 - I2C0_SCL bit 14 - I2C0_SDA bit 13 - UART2_CTS_B bit 12 - UART2_RTS_B bit 11 - UART2_TXD bit 10 - UART2_RXD bit 9 - UART1_CTS_B bit 8 - UART1_RTS_B bit 7 - UART1_TXD bit 6 - UART1_RXD bit 5 - SPI1_CLK bit 4 - SPI1_MOSI bit 3 - SPI1_MISO bit 2 - SPI1_CS0_B bit 1 - GP_SSP_2_TXD bit 0 - GP_SSP_2_RXD

39.7.18 South Core Trigger Status 3 (cfio_ioreg_SC_TS_95_64_)—Offset 54h

When set to a 1, the corresponding GPIO (if enabled in the GPIO_USE_SEL register) if enabled as input via IO_SEL(n), triggered an GPE or SMI. This will be set if a 0 to 1 transition occurred and TPE(n) was set, or a 1 to 0 transition occurred and TNE(n) was set. If both TPE(n) and TNE(n) are set, then this bit will be set on both a 0 to 1 and a 1 to 0 transition. This bit will not be set if the GPIO is configured as an output. - Only the 8 lsb are used in VLV

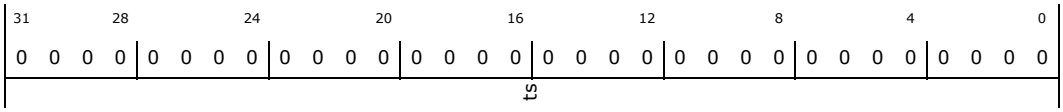
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE] + 54h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000 00000000 00000000 00000b WOC	**ts:** bit 31 - PWM1 bit 30 - PWM0 bit 29 - I2C_NFC_SCL bit 28 - I2C_NFC_SDA bit 27 - I2C6_SCL bit 26 - I2C6_SDA bit 25 - I2C5_SCL bit 24 - I2C5_SDA bit 23 - I2C4_SCL bit 22 - I2C4_SDA bit 21 - I2C3_SCL bit 20 - I2C3_SDA bit 19 - I2C2_SCL bit 18 - I2C2_SDA bit 17 - I2C1_SCL bit 16 - I2C1_SDA bit 15 - I2C0_SCL bit 14 - I2C0_SDA bit 13 - UART2_CTS_B bit 12 - UART2_RTS_B bit 11 - UART2_TXD bit 10 - UART2_RXD bit 9 - UART1_CTS_B bit 8 - UART1_RTS_B bit 7 - UART1_TXD bit 6 - UART1_RXD bit 5 - SPI1_CLK bit 4 - SPI1_MOSI bit 3 - SPI1_MISO bit 2 - SPI1_CS0_B bit 1 - GP_SSP_2_TXD bit 0 - GP_SSP_2_RXD

39.7.19 South Core Use Select 4 (cfio_ioreg_SC_USE_SEL_127_96_)—Offset 60h

Access via PCU proxy, the register is setting the corresponding GPIO to be selected and to be changed to IO access instead of the default Memory access. Bit 0 will set GPIO[0], and bit 1 will set GPIO[1] and so on. The default of IO GPIO pad is input so pull must be activated in the pad pconf0 register.

Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE] + 60h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h

39.8.1 Uart1 Rts B Pad Configuration (cfio_regs_pad_uart1_rts_b_PCONF0)—Offset 0h

PADs Memory space configuration register

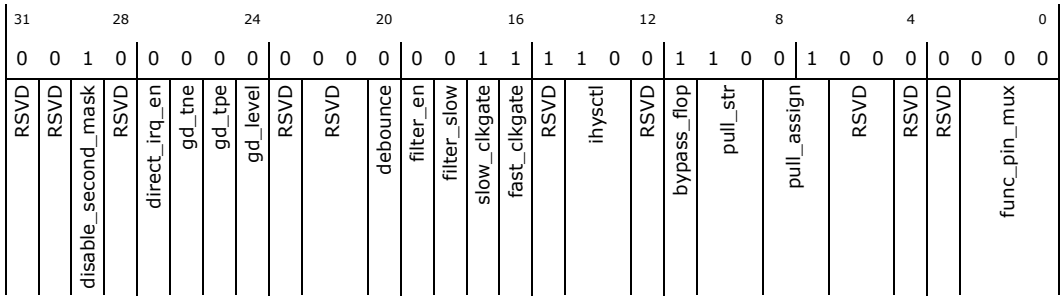
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 0h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003CC80h



Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	**Reserved (RSVD):** Reserved.
30	0b RO	**Reserved (RSVD):** Reserved.
29	1b RW	**Disable Second Mask (disable_second_mask):** Reserved as one
28	0b RO	**Reserved (RSVD):** Reserved.
27	0b RW	**Direct Irq En (direct_irq_en):** If this bit is set, interrupt will use direct wire and not shared. This bit should be cleared if io access mode is selected for this pad
26	0b RW	**Gd Tne (gd_tne):** Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect falling edge. For level interrupt mode it will enable active low level irq
25	0b RW	**Gd Tpe (gd_tpe):** Positive edge detect for general detect event. 0 - No rising edge detect. 1 - Detect rising edge. For level interrupt mode it will enable active high level irq
24	0b RW	**Gd Level (gd_level):** When this bit is set a level irq will be choose and not edge irq
23	0b RO	**Reserved (RSVD):** Reserved.
22:21	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
20	0b RW	**Debounce (debounce):** Enabling the debouncer for this pad. Debounce time will be according to the community setting at the debounce control register
19	0b RW	**Filter En (filter_en):** Enabling the glitch filter.
18	0b RW	**Filter Slow (filter_slow):** Switchg to slow mode glitch filter, using 32KHz clock with 62.5us glitch window filter.
17	1b RW	**Slow Clkgate (slow_clkgate):** Reserved as 1
16	1b RW	**Fast Clkgate (fast_clkgate):** Reserved as 1
15	1b RO	**Reserved (RSVD):** Reserved.
14:13	10b RW	**Ihysctl (ihysctl):** Hysteresis control. 00: min vil(V) - 0.61254 max vih(V) - 1.19637 min vil(%) - 36.9 max vih(%) - 63.9 min hysteresis(V) - 0.25232 01: min vil(V) - 0.6391 max vih(V) - 1.19637 min vil(%) - 38.5 max vih(%) - 63.9 min hysteresis(V) - 0.21912 10: min vil(V) - 0.61254 max vih(V) - 1.16991 min vil(%) - 36.9 max vih(%) - 62.3 min hysteresis(V) - 0.22244 11: min vil(V) - 0.6391 max vih(V) - 1.16991 min vil(%) - 38.5 max vih(%) - 62.3 min hysteresis(V) - 0.18924
12	0b RO	**Reserved (RSVD):** Reserved.
11	1b RO	**Bypass Flop (bypass_flop):** Reserved as 1
10:9	10b RW	**Pull Str (pull_str):** Pull strength: 00 - 2K 01 - reserved 10 - 20K 11 - reserved
8:7	01b RW	**Pull Assign (pull_assign):** Pull assignment is only applicable when pad is in input mode. 00 - Non pull 01 - Pull up 10 - Pull down 11 - reserved

Bit Range	Default & Access	Field Name (ID): Description
6:5	00b RO	**Reserved (RSVD):** Reserved.
4	0b RO	**Reserved (RSVD):** Reserved.
3	0b RO	**Reserved (RSVD):** Reserved.
2:0	000b RW	**Func Pin Mux (func_pin_mux):** Func_Pin_Mux: Functional Pin Muxing Default function is always 0. These 3 bits are setting the memory function. function 0 is GPIOC_72 function 1 is UART1_RTS_B

39.8.2 Uart1 Rts B Pad Value (cfio_regs_pad_uart1_rts_b_PAD_VAL)—Offset 8h

PADs Memory space Value register

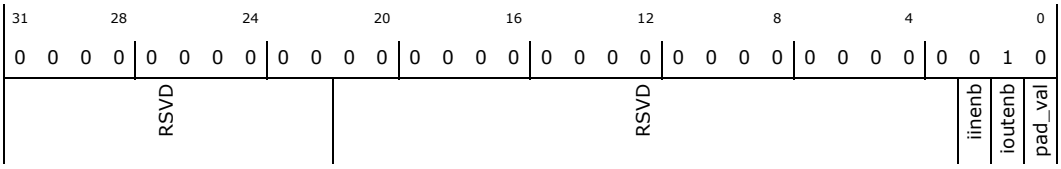
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 8h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved.
21:3	0h RO	**Reserved (RSVD):** Reserved.
2	0b RW	**Iinenb (iinenb):** input disable. 0 - input enabled 1 - input disabled. This bit must be cleared if output readback is required
1	1b RW	**Ioutenb (ioutenb):** output disable. 0 - output enabled 1 - output disabled.

Bit Range	Default & Access	Field Name (ID): Description
0	0b RW	**Pad Val (pad_val):** Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.8.3 Uart1 Txd Pad Configuration (cfio_regs_pad_uart1_txd_PCONF0)—Offset 10h

PADs Memory space configuration register

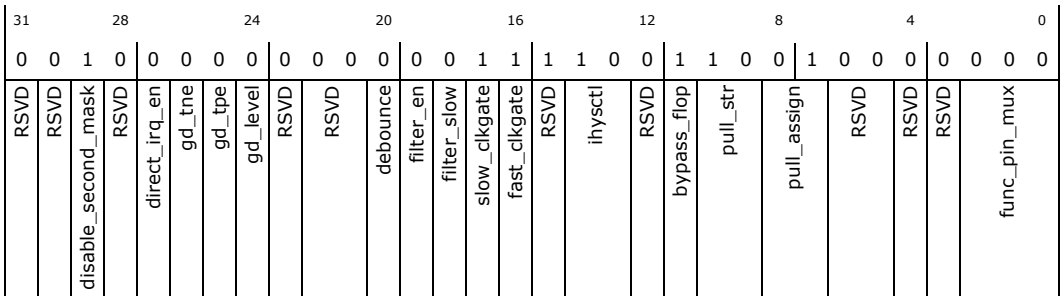
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 10h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003CC80h



Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	**Reserved (RSVD):** Reserved.
30	0b RO	**Reserved (RSVD):** Reserved.
29	1b RW	**Disable Second Mask (disable_second_mask):** Reserved as one
28	0b RO	**Reserved (RSVD):** Reserved.
27	0b RW	**Direct Irq En (direct_irq_en):** If this bit is set, interrupt will use direct wire and not shared. This bit should be cleared if io access mode is selected for this pad
26	0b RW	**Gd Tne (gd_tne):** Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect falling edge. For level interrupt mode it will enable active low level irq

Bit Range	Default & Access	Field Name (ID): Description
25	0b RW	**Gd Tpe (gd_tpe):** Positive edge detect for general detect event. 0 - No rising edge detect. 1 - Detect rising edge. For level interrupt mode it will enable active high level irq

PADs Memory space Value register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

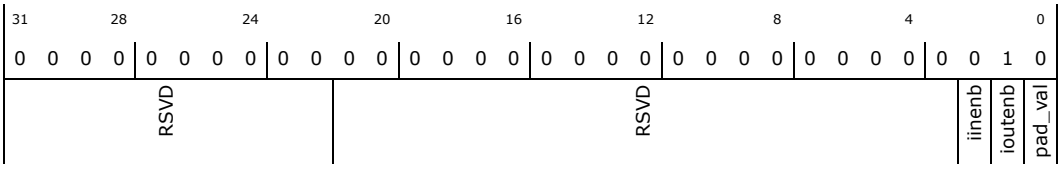
Offset: [IOBASE] + 208h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
21:3	0h RO	**Reserved (RSVD):** Reserved.
2	0b RW	**Iinenb (iinenb):** input disable. 0 - input enabled 1 - input disabled. This bit must be cleared if output readback is required
1	1b RW	**Ioutenb (ioutenb):** output disable. 0 - output enabled 1 - output disabled.
0	0b RW	**Pad Val (pad_val):** Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.8.67 I2c0 Sda Pad Configuration (cfio_regs_pad_i2c0_sda_PCONF0)—Offset 210h

PADs Memory space configuration register

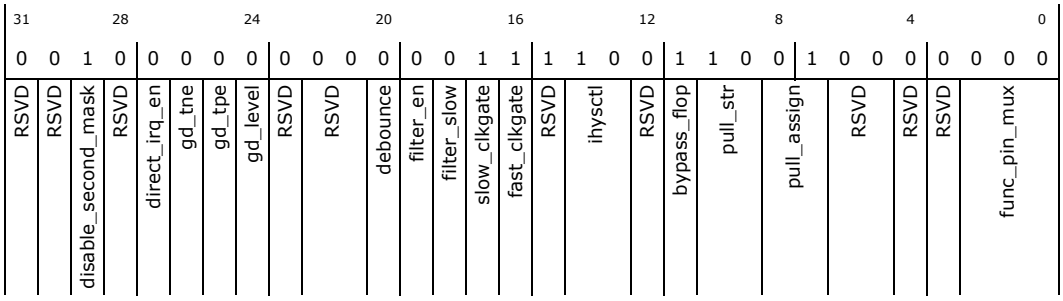
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 210h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003CC80h



Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	**Reserved (RSVD):** Reserved.
30	0b RO	**Reserved (RSVD):** Reserved.
29	1b RW	**Disable Second Mask (disable_second_mask):** Reserved as one

Bit Range	Default & Access	Field Name (ID): Description
28	0b RO	**Reserved (RSVD):** Reserved.
27	0b RW	**Direct Irq En (direct_irq_en):** If this bit is set, interrupt will use direct wire and not shared. This bit should be cleared if io access mode is selected for this pad
26	0b RW	**Gd Tne (gd_tne):** Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect falling edge. For level interrupt mode it will enable active low level irq
25	0b RW	**Gd Tpe (gd_tpe):** Positive edge detect for general detect event. 0 - No rising edge detect. 1 - Detect rising edge. For level interrupt mode it will enable active high level irq
24	0b RW	**Gd Level (gd_level):** When this bit is set a level irq will be choose and not edge irq
23	0b RO	**Reserved (RSVD):** Reserved.
22:21	0h RO	**Reserved (RSVD):** Reserved.
20	0b RW	**Debounce (debounce):** Enabling the debouncer for this pad. Debounce time will be according to the community setting at the debounce control register
19	0b RW	**Filter En (filter_en):** Enabling the glitch filter.
18	0b RW	**Filter Slow (filter_slow):** Switchg to slow mode glitch filter, using 32KHz clock with 62.5us glitch window filter.
17	1b RW	**Slow Clkgate (slow_clkgate):** Reserved as 1
16	1b RW	**Fast Clkgate (fast_clkgate):** Reserved as 1
15	1b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
14:13	10b RW	**Ihysctl (ihysctl):** Hysteresis control. 00: min vil(V) - 0.61254 max vih(V) - 1.19637 min vil(%) - 36.9 max vih(%) - 63.9 min hysteresis(V) - 0.25232 01: min vil(V) - 0.6391 max vih(V) - 1.19637 min vil(%) - 38.5 max vih(%) - 63.9 min hysteresis(V) - 0.21912 10: min vil(V) - 0.61254 max vih(V) - 1.16991 min vil(%) - 36.9 max vih(%) - 62.3 min hysteresis(V) - 0.22244 11: min vil(V) - 0.6391 max vih(V) - 1.16991 min vil(%) - 38.5 max vih(%) - 62.3 min hysteresis(V) - 0.18924

These 3 bits are setting the memory function. function 0 is GPIOC_9 function 1 is GP_SSP_0_I2S_FS For this function, software should make sure it changes the default pull from down to up. pull assign field, bits [8:7] should be set to 2'b01 function 2 is HDA_SYNC For this function, software should make sure it changes the default pull from down to up. pull assign field, bits [8:7] should be set to 2'b01

39.8.76 Hda Sync Pad Value (cfio_regs_pad_hda_sync_PAD_VAL)—Offset 258h

PADs Memory space Value register

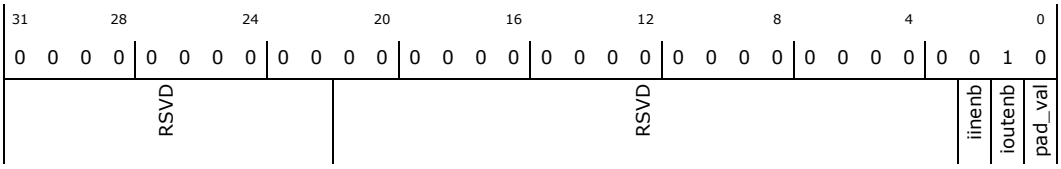
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 258h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved.
21:3	0h RO	**Reserved (RSVD):** Reserved.
2	0b RW	**Iinenb (iinenb):** input disable. 0 - input enabled 1 - input disabled. This bit must be cleared if output readback is required
1	1b RW	**Ioutenb (ioutenb):** output disable. 0 - output enabled 1 - output disabled.
0	0b RW	**Pad Val (pad_val):** Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.8.77 Hda Sdo Pad Configuration (cfio_regs_pad_hda_sdo_PCONF0)—Offset 260h

PADs Memory space configuration register

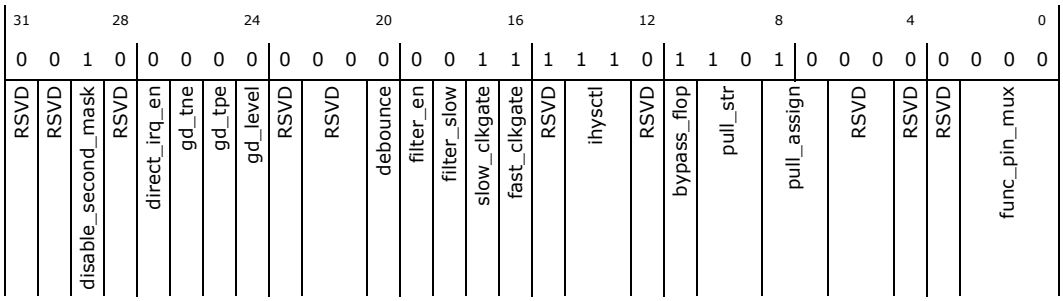
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 260h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003ED00h



Bit Range	Default & Access	Field Name (ID): Description

39.8.86 Sdmmc3 D3 Pad Value (cfio_regs_pad_sdmmc3_d3_PAD_VAL)—Offset 2A8h

PADs Memory space Value register

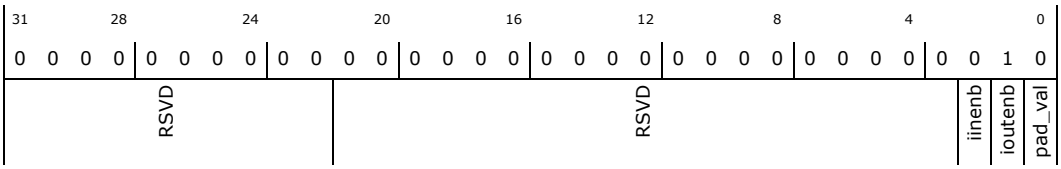
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 2A8h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved.
21:3	0h RO	**Reserved (RSVD):** Reserved.
2	0b RW	**Iinenb (iinenb):** input disable. 0 - input enabled 1 - input disabled. This bit must be cleared if output readback is required
1	1b RW	**Ioutenb (ioutenb):** output disable. 0 - output enabled 1 - output disabled.
0	0b RW	**Pad Val (pad_val):** Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.8.87 Sdmmc3 Clk Pad Configuration (cfio_regs_pad_sdmmc3_clk_PCONF0)—Offset 2B0h

PADs Memory space configuration register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 2B0h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 20038D00h

Type: Memory Mapped I/O Register (Size: 32 bits)

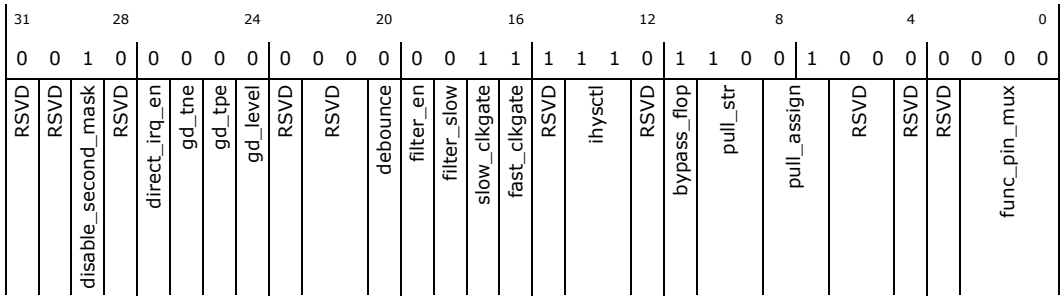
Offset: [IOBASE] + 300h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003EC80h



Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	**Reserved (RSVD):** Reserved.
30	0b RO	**Reserved (RSVD):** Reserved.
29	1b RW	**Disable Second Mask (disable_second_mask):** Reserved as one
28	0b RO	**Reserved (RSVD):** Reserved.
27	0b RW	**Direct Irq En (direct_irq_en):** If this bit is set, interrupt will use direct wire and not shared. This bit should be cleared if io access mode is selected for this pad
26	0b RW	**Gd Tne (gd_tne):** Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect falling edge. For level interrupt mode it will enable active low level irq
25	0b RW	**Gd Tpe (gd_tpe):** Positive edge detect for general detect event. 0 - No rising edge detect. 1 - Detect rising edge. For level interrupt mode it will enable active high level irq
24	0b RW	**Gd Level (gd_level):** When this bit is set a level irq will be choose and not edge irq
23	0b RO	**Reserved (RSVD):** Reserved.
22:21	0h RO	**Reserved (RSVD):** Reserved.
20	0b RW	**Debounce (debounce):** Enabling the debouncer for this pad. Debounce time will be according to the community setting at the debounce control register
19	0b RW	**Filter En (filter_en):** Enabling the glitch filter.
18	0b RW	**Filter Slow (filter_slow):** Switchg to slow mode glitch filter, using 32KHz clock with 62.5us glitch window filter.
17	1b RW	**Slow Clkgate (slow_clkgate):** Reserved as 1

Bit Range	Default & Access	Field Name (ID): Description
16	1b RW	**Fast Clkgate (fast_clkgate):** Reserved as 1
15	1b RO	**Reserved (RSVD):** Reserved.
14:13	11b RW	**Ihysctl (ihysctl):** Hysteresis control. 00: min vil(V) - 0.61254 max vih(V) - 1.19637 min vil(%) - 36.9 max vih(%) - 63.9 min hysteresis(V) - 0.25232 01: min vil(V) - 0.6391 max vih(V) - 1.19637 min vil(%) - 38.5 max vih(%) - 63.9 min hysteresis(V) - 0.21912 10: min vil(V) - 0.61254 max vih(V) - 1.16991 min vil(%) - 36.9 max vih(%) - 62.3 min hysteresis(V) - 0.22244 11: min vil(V) - 0.6391 max vih(V) - 1.16991 min vil(%) - 38.5 max vih(%) - 62.3 min hysteresis(V) - 0.18924
12	0b RO	**Reserved (RSVD):** Reserved.
11	1b RO	**Bypass Flop (bypass_flop):** Reserved as 1
10:9	10b RW	**Pull Str (pull_str):** Pull strength: 00 - 2K 01 - reserved 10 - 20K 11 - reserved
8:7	01b RW	**Pull Assign (pull_assign):** Pull assignment is only applicable when pad is in input mode. 00 - Non pull 01 - Pull up 10 - Pull down 11 - reserved
6:5	00b RO	**Reserved (RSVD):** Reserved.
4	0b RO	**Reserved (RSVD):** Reserved.
3	0b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2:0	000b RW	**Func Pin Mux (func_pin_mux):** Func_Pin_Mux: Functional Pin Muxing Default function is always 0. These 3 bits are setting the memory function. function 0 is GPIOC_32 function 1 is SDMMC2_CMD

39.8.99 Sdmmc2 Cmd Pad Value (cfio_regs_pad_sdmmc2_cmd_PAD_VAL)—Offset 308h

PADs Memory space Value register

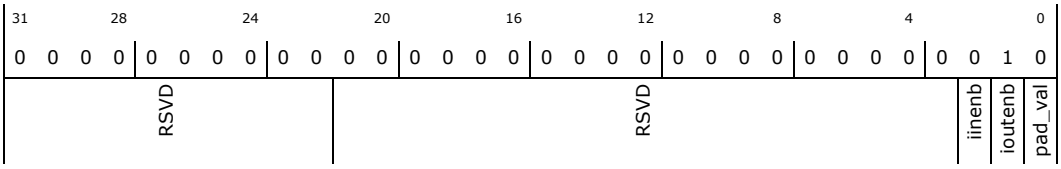
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 308h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved.
21:3	0h RO	**Reserved (RSVD):** Reserved.
2	0b RW	**Iinenb (iinenb):** input disable. 0 - input enabled 1 - input disabled. This bit must be cleared if output readback is required
1	1b RW	**Ioutenb (ioutenb):** output disable. 0 - output enabled 1 - output disabled.
0	0b RW	**Pad Val (pad_val):** Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.8.100 Sdmmc2 D3 Cd B Pad Configuration (cfio_regs_pad_sdmmc2_d3_cd_b_PCONF0)—Offset 310h

PADs Memory space configuration register

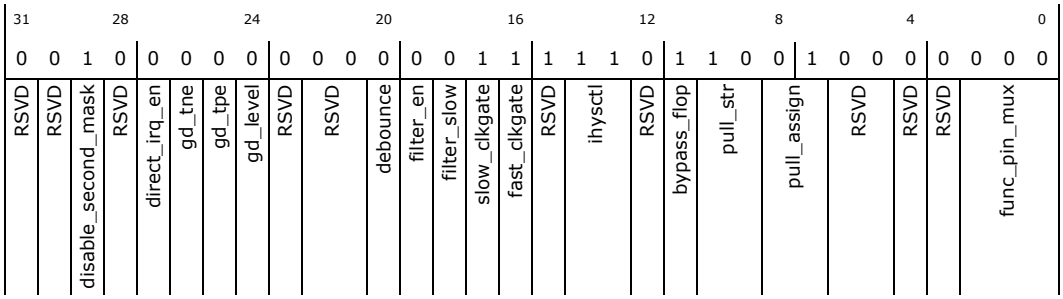
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 310h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003EC80h



Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	**Reserved (RSVD):** Reserved.
30	0b RO	**Reserved (RSVD):** Reserved.
29	1b RW	**Disable Second Mask (disable_second_mask):** Reserved as one
28	0b RO	**Reserved (RSVD):** Reserved.
27	0b RW	**Direct Irq En (direct_irq_en):** If this bit is set, interrupt will use direct wire and not shared. This bit should be cleared if io access mode is selected for this pad
26	0b RW	**Gd Tne (gd_tne):** Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect falling edge. For level interrupt mode it will enable active low level irq
25	0b RW	**Gd Tpe (gd_tpe):** Positive edge detect for general detect event. 0 - No rising edge detect. 1 - Detect rising edge. For level interrupt mode it will enable active high level irq
24	0b RW	**Gd Level (gd_level):** When this bit is set a level irq will be choose and not edge irq
23	0b RO	**Reserved (RSVD):** Reserved.
22:21	0h RO	**Reserved (RSVD):** Reserved.
20	0b RW	**Debounce (debounce):** Enabling the debouncer for this pad. Debounce time will be according to the community setting at the debounce control register
19	0b RW	**Filter En (filter_en):** Enabling the glitch filter.

Bit Range	Default & Access	Field Name (ID): Description
18	0b RW	**Filter Slow (filter_slow):** Switchg to slow mode glitch filter, using 32KHz clock with 62.5us glitch window filter.

39.8.108 Sdmmc2 D2 Pad Value (cfio_regs_pad_sdmmc2_d2_PAD_VAL)—Offset 348h

PADs Memory space Value register

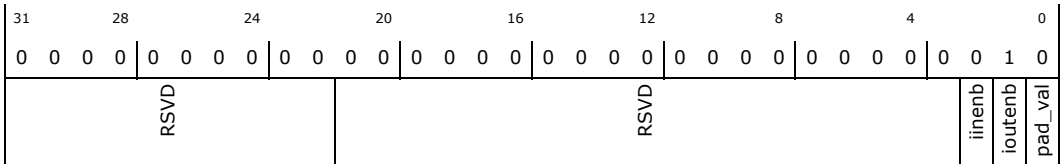
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 348h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved.
21:3	0h RO	**Reserved (RSVD):** Reserved.
2	0b RW	**Iinenb (iinenb):** input disable. 0 - input enabled 1 - input disabled. This bit must be cleared if output readback is required
1	1b RW	**Ioutenb (ioutenb):** output disable. 0 - output enabled 1 - output disabled.
0	0b RW	**Pad Val (pad_val):** Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.8.109 Sdmmc2 D0 Pad Configuration (cfio_regs_pad_sdmmc2_d0_PCONF0)—Offset 350h

PADs Memory space configuration register

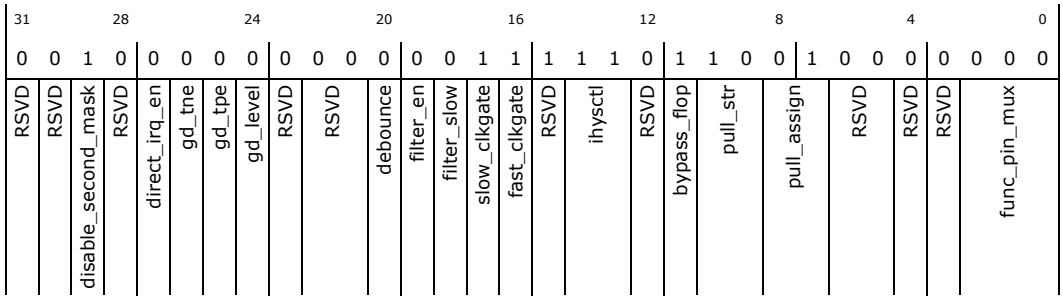
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 350h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003EC80h



Bit Range	Default & Access	Field Name (ID): Description

Type: Memory Mapped I/O Register (Size: 32 bits)

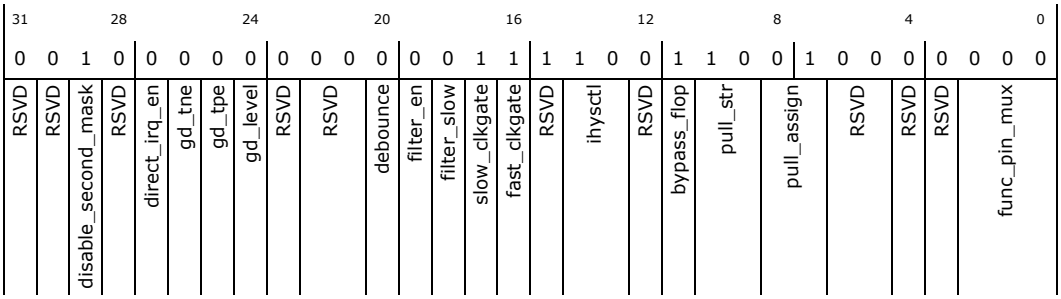
Offset: [IOBASE] + 580h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003CC80h



Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	**Reserved (RSVD):** Reserved.
30	0b RO	**Reserved (RSVD):** Reserved.
29	1b RW	**Disable Second Mask (disable_second_mask):** Reserved as one
28	0b RO	**Reserved (RSVD):** Reserved.
27	0b RW	**Direct Irq En (direct_irq_en):** If this bit is set, interrupt will use direct wire and not shared. This bit should be cleared if io access mode is selected for this pad
26	0b RW	**Gd Tne (gd_tne):** Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect falling edge. For level interrupt mode it will enable active low level irq
25	0b RW	**Gd Tpe (gd_tpe):** Positive edge detect for general detect event. 0 - No rising edge detect. 1 - Detect rising edge. For level interrupt mode it will enable active high level irq
24	0b RW	**Gd Level (gd_level):** When this bit is set a level irq will be choose and not edge irq
23	0b RO	**Reserved (RSVD):** Reserved.
22:21	0h RO	**Reserved (RSVD):** Reserved.
20	0b RW	**Debounce (debounce):** Enabling the debouncer for this pad. Debounce time will be according to the community setting at the debounce control register
19	0b RW	**Filter En (filter_en):** Enabling the glitch filter.

Bit Range	Default & Access	Field Name (ID): Description
18	0b RW	**Filter Slow (filter_slow):** Switchg to slow mode glitch filter, using 32KHz clock with 62.5us glitch window filter.
17	1b RW	**Slow Clkgate (slow_clkgate):** Reserved as 1
16	1b RW	**Fast Clkgate (fast_clkgate):** Reserved as 1
15	1b RO	**Reserved (RSVD):** Reserved.
14:13	10b RW	**Ihysctl (ihysctl):** Hysteresis control. 00: min vil(V) - 0.61254 max vih(V) - 1.19637 min vil(%) - 36.9 max vih(%) - 63.9 min hysteresis(V) - 0.25232 01: min vil(V) - 0.6391 max vih(V) - 1.19637 min vil(%) - 38.5 max vih(%) - 63.9 min hysteresis(V) - 0.21912 10: min vil(V) - 0.61254 max vih(V) - 1.16991 min vil(%) - 36.9 max vih(%) - 62.3 min hysteresis(V) - 0.22244 11: min vil(V) - 0.6391 max vih(V) - 1.16991 min vil(%) - 38.5 max vih(%) - 62.3 min hysteresis(V) - 0.18924
12	0b RO	**Reserved (RSVD):** Reserved.
11	1b RO	**Bypass Flop (bypass_flop):** Reserved as 1
10:9	10b RW	**Pull Str (pull_str):** Pull strength: 00 - 2K 01 - reserved 10 - 20K 11 - reserved
8:7	01b RW	**Pull Assign (pull_assign):** Pull assignment is only applicable when pad is in input mode. 00 - Non pull 01 - Pull up 10 - Pull down 11 - reserved
6:5	00b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	0b RO	**Reserved (RSVD):** Reserved.
3	0b RO	**Reserved (RSVD):** Reserved.
2:0	000b RW	**Func Pin Mux (func_pin_mux):** Func_Pin_Mux: Functional Pin Muxing Default function is always 0. These 3 bits are setting the memory function. function 0 is GPIOC_52 function 1 is SMB_CLK

39.8.183 Smb Clk Pad Value (cfio_regs_pad_smb_clk_PAD_VAL)—Offset 588h

PADs Memory space Value register

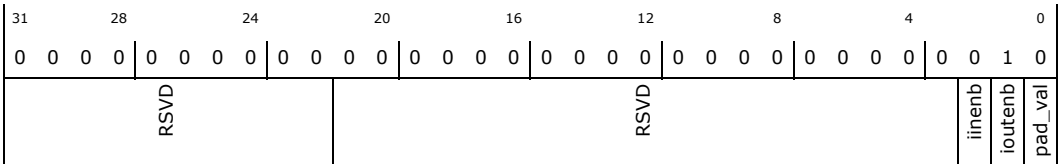
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 588h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved.
21:3	0h RO	**Reserved (RSVD):** Reserved.
2	0b RW	**Iinenb (iinenb):** input disable. 0 - input enabled 1 - input disabled. This bit must be cleared if output readback is required
1	1b RW	**Ioutenb (ioutenb):** output disable. 0 - output enabled 1 - output disabled.
0	0b RW	**Pad Val (pad_val):** Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.8.184 Sata Gp1 Pad Configuration (cfio_regs_pad_sata_gp1_PCONF0)—Offset 590h

PADs Memory space configuration register

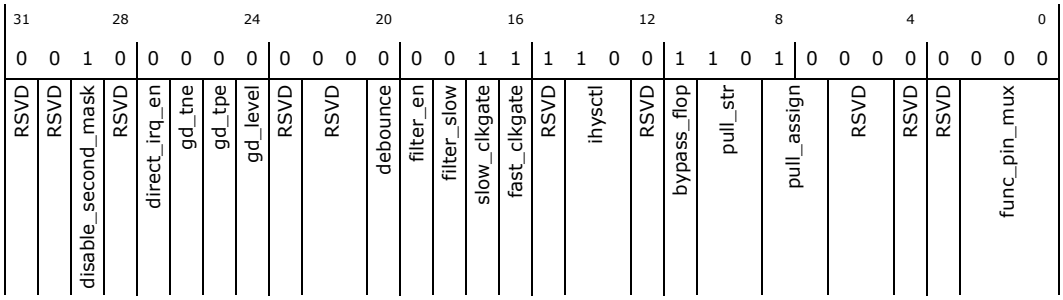
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 590h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003CD00h



Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	**Reserved (RSVD):** Reserved.
30	0b RO	**Reserved (RSVD):** Reserved.
29	1b RW	**Disable Second Mask (disable_second_mask):** Reserved as one
28	0b RO	**Reserved (RSVD):** Reserved.
27	0b RW	**Direct Irq En (direct_irq_en):** If this bit is set, interrupt will use direct wire and not shared. This bit should be cleared if io access mode is selected for this pad
26	0b RW	**Gd Tne (gd_tne):** Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect falling edge. For level interrupt mode it will enable active low level irq
25	0b RW	**Gd Tpe (gd_tpe):** Positive edge detect for general detect event. 0 - No rising edge detect. 1 - Detect rising edge. For level interrupt mode it will enable active high level irq
24	0b RW	**Gd Level (gd_level):** When this bit is set a level irq will be choose and not edge irq
23	0b RO	**Reserved (RSVD):** Reserved.
22:21	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
20	0b RW	**Debounce (debounce):** Enabling the debouncer for this pad. Debounce time will be according to the community setting at the debounce control register
19	0b RW	**Filter En (filter_en):** Enabling the glitch filter.
18	0b RW	**Filter Slow (filter_slow):** Switchg to slow mode glitch filter, using 32KHz clock with 62.5us glitch window filter.
17	1b RW	**Slow Clkgate (slow_clkgate):** Reserved as 1
16	1b RW	**Fast Clkgate (fast_clkgate):** Reserved as 1
15	1b RO	**Reserved (RSVD):** Reserved.
14:13	10b RW	**Ihysctl (ihysctl):** Hysteresis control. 00: min vil(V) - 0.61254 max vih(V) - 1.19637 min vil(%) - 36.9 max vih(%) - 63.9 min hysteresis(V) - 0.25232 01: min vil(V) - 0.6391 max vih(V) - 1.19637 min vil(%) - 38.5 max vih(%) - 63.9 min hysteresis(V) - 0.21912 10: min vil(V) - 0.61254 max vih(V) - 1.16991 min vil(%) - 36.9 max vih(%) - 62.3 min hysteresis(V) - 0.22244 11: min vil(V) - 0.6391 max vih(V) - 1.16991 min vil(%) - 38.5 max vih(%) - 62.3 min hysteresis(V) - 0.18924
12	0b RO	**Reserved (RSVD):** Reserved.
11	1b RO	**Bypass Flop (bypass_flop):** Reserved as 1
10:9	10b RW	**Pull Str (pull_str):** Pull strength: 00 - 2K 01 - reserved 10 - 20K 11 - reserved
8:7	10b RW	**Pull Assign (pull_assign):** Pull assignment is only applicable when pad is in input mode. 00 - Non pull 01 - Pull up 10 - Pull down 11 - reserved

39.8.222 Vgpio 0 Pad Value (cfio_regs_pad_vgpio_0_PAD_VAL)—Offset 6B8h

PADs Memory space Value register

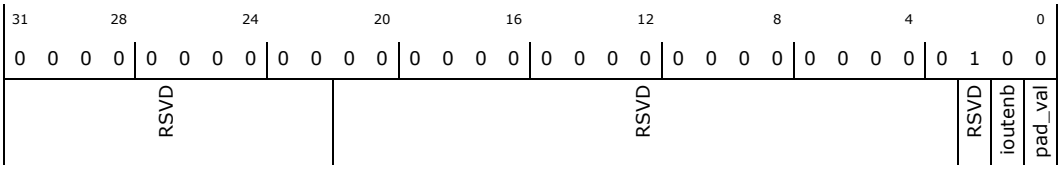
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 6B8h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000004h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved.
21:3	0h RO	**Reserved (RSVD):** Reserved.
2	1b RO	**Reserved (RSVD):** Reserved.
1	0b RW	**Ioutenb (ioutenb):** output disable. 0 - output enabled 1 - output disabled.
0	0b RW	**Pad Val (pad_val):** Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.8.223 Vgpio 1 Pad Configuration (cfio_regs_pad_vgpio_1_PCONF0)—Offset 6C0h

PADs Memory space configuration register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 6C0h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 20038800h

0	0b RW	**Pad Val (pad_val):** Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.8.235 Vgpio 7 Pad Configuration (cfio_regs_pad_vgpio_7_PCONF0)—Offset 720h

PADs Memory space configuration register

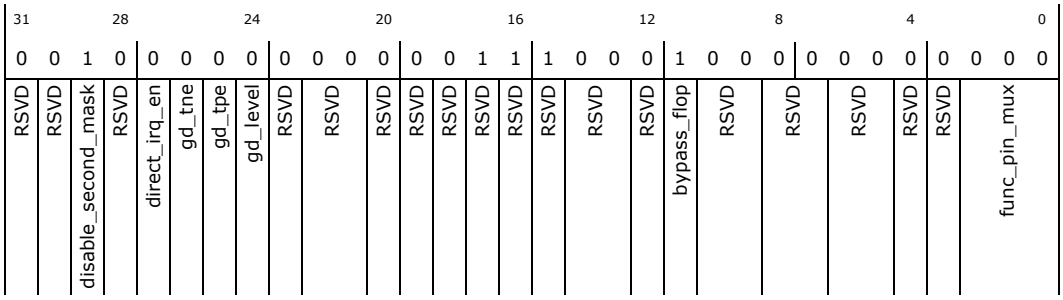
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 720h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 20038800h



Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	**Reserved (RSVD):** Reserved.
30	0b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
29	1b RW	**Disable Second Mask (disable_second_mask):** Reserved as one
28	0b RO	**Reserved (RSVD):** Reserved.
27	0b RW	**Direct Irq En (direct_irq_en):** If this bit is set, interrupt will use direct wire and not shared. This bit should be cleared if io access mode is selected for this pad
26	0b RW	**Gd Tne (gd_tne):** Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect falling edge. For level interrupt mode it will enable active low level irq
25	0b RW	**Gd Tpe (gd_tpe):** Positive edge detect for general detect event. 0 - No rising edge detect. 1 - Detect rising edge. For level interrupt mode it will enable active high level irq
24	0b RW	**Gd Level (gd_level):** When this bit is set a level irq will be choose and not edge irq
23	0b RO	**Reserved (RSVD):** Reserved.
22:21	0h RO	**Reserved (RSVD):** Reserved.

Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.8.261 Vgpio 20 Pad Configuration (cfio_regs_pad_vgpio_20_PCONF0)—Offset 7F0h

PADs Memory space configuration register

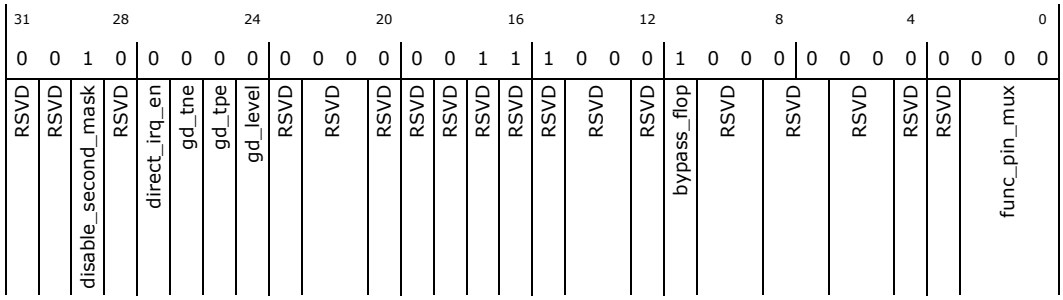
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 7F0h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 20038800h



Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	**Reserved (RSVD):** Reserved.
30	0b RO	**Reserved (RSVD):** Reserved.
29	1b RW	**Disable Second Mask (disable_second_mask):** Reserved as one
28	0b RO	**Reserved (RSVD):** Reserved.
27	0b RW	**Direct Irq En (direct_irq_en):** If this bit is set, interrupt will use direct wire and not shared. This bit should be cleared if io access mode is selected for this pad
26	0b RW	**Gd Tne (gd_tne):** Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect falling edge. For level interrupt mode it will enable active low level irq
25	0b RW	**Gd Tpe (gd_tpe):** Positive edge detect for general detect event. 0 - No rising edge detect. 1 - Detect rising edge. For level interrupt mode it will enable active high level irq
24	0b RW	**Gd Level (gd_level):** When this bit is set a level irq will be choose and not edge irq
23	0b RO	**Reserved (RSVD):** Reserved.
22:21	0h RO	**Reserved (RSVD):** Reserved.
20	0b RO	**Reserved (RSVD):** Reserved.
19	0b RO	**Reserved (RSVD):** Reserved.
18	0b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
17	1b RO	**Slow Clkgate (slow_clkgate):** Reserved as 1 **Reserved (RSVD):** Reserved.
16	1b RO	**Fast Clkgate (fast_clkgate):** Reserved as 1 **Reserved (RSVD):** Reserved.
15	1b RO	**Reserved (RSVD):** Reserved.
14:13	00b RO	**Reserved (RSVD):** Reserved.
12	0b RO	**Reserved (RSVD):** Reserved.
11	1b RO	**Bypass Flop (bypass_flop):** Reserved as 1
10:9	00b RO	**Reserved (RSVD):** Reserved.
8:7	00b RO	**Reserved (RSVD):** Reserved.
6:5	00b RO	**Reserved (RSVD):** Reserved.
4	0b RO	**Reserved (RSVD):** Reserved.
3	0b RO	**Reserved (RSVD):** Reserved.
2:0	000b RW	**Func Pin Mux (func_pin_mux):** Func_Pin_Mux: Functional Pin Muxing Default function is always 0. These 3 bits are setting the memory function.

39.8.262 Vgpio 20 Pad Value (cfio_regs_pad_vgpio_20_PAD_VAL)—Offset 7F8h

PADs Memory space Value register

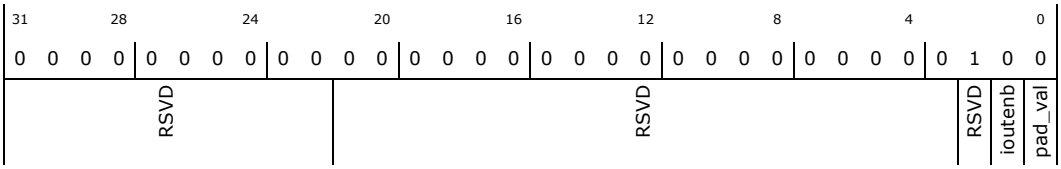
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 7F8h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000004h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved.
21:3	0h RO	**Reserved (RSVD):** Reserved.
2	1b RO	**Reserved (RSVD):** Reserved.
1	0b RW	**Ioutenb (ioutenb):** output disable. 0 - output enabled 1 - output disabled.
0	0b RW	**Pad Val (pad_val):** Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.8.263 TS0 SCORE Interrupt Status 0 (cfio_regs_REG_TS0_SCORE_IRQ_TS_0)—Offset 800h

IRQ TS 0 status register

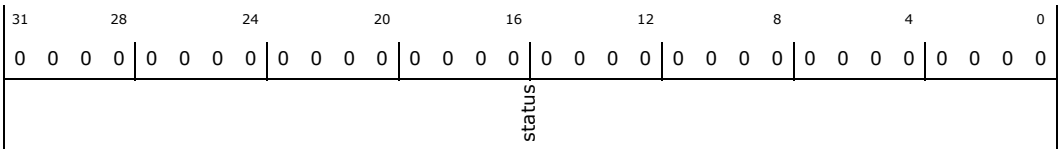
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 800h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RWOC	**Status (status):** Trigger IRQ Status: Write one to clear. This status is reflecting IRQ in MMIO access mode only Bellow is the given list of gpio number and pads, the irq status refers to bit 31 - SDMMC2_D3_CD_B bit 30 - SDMMC2_D2 bit 29 - SDMMC2_D1 bit 28 - SDMMC2_D0 bit 27 - SDMMC2_CLK bit 26 - MMC1_RESET_B bit 25 - SDMMC1_CMD bit 24 - MMC1_D7 bit 23 - MMC1_D6 bit 22 - MMC1_D5 bit 21 - MMC1_D4_SD_WE bit 20 - SDMMC1_D3_CD_B bit 19 - SDMMC1_D2 bit 18 - SDMMC1_D1 bit 17 - SDMMC1_D0 bit 16 - SDMMC1_CLK bit 15 - HDA_DOCKENB bit 14 - HDA_DOCKRSTB bit 13 - HDA_SDI1 bit 12 - HDA_SDI0 bit 11 - HDA_SDO bit 10 - HDA_CLK bit 9 - HDA_SYNC bit 8 - HDA_RSTB bit 7 - PCIE_CLKREQ4B bit 6 - PCIE_CLKREQ3B bit 5 - PCIE_CLKREQ2B bit 4 - PCIE_CLKREQ1B bit 3 - PCIE_CLKREQ0B bit 2 - SATA_LEDN bit 1 - SATA_GP1 bit 0 - SATA_GP0

39.8.264 TS1 SCORE Interrupt Status 1 (cfio_regs_REG_TS1_SCORE_IRQ_TS_1)—Offset 804h

IRQ TS 1 status register

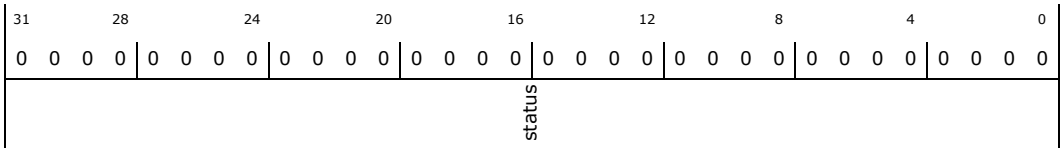
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 804h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RWOC	**Status (status):** Trigger IRQ Status: Write one to clear. This status is reflecting IRQ in MMIO access mode only Bellow is the given list of gpio number and pads, the irq status refers to bit 31 - GP_SSP_2_FS bit 30 - GP_SSP_2_CLK bit 29 - MHSI_CAREADY bit 28 - MHSI_CAFLAG bit 27 - MHSI_CADATA bit 26 - MHSI_ACWAKE bit 25 - MHSI_ACREADY bit 24 - MHSI_ACFLAG bit 23 - MHSI_ACDATA bit 22 - SPKR bit 21 - SMB_ALERTB bit 20 - SMB_CLK bit 19 - SMB_DATA bit 18 - ILB_SERIRQ bit 17 - LPC_CLKRUNB bit 16 - LPC_CLKOUT1 bit 15 - LPC_CLKOUT0 bit 14 - LPC_FRAMEB bit 13 - LPC_AD3 bit 12 - LPC_AD2 bit 11 - LPC_AD1 bit 10 - LPC_AD0 bit 9 - SDMMC3_PWR_EN_B bit 8 - SDMMC3_1P8_EN bit 7 - SDMMC3_CMD bit 6 - SDMMC3_CD_B bit 5 - SDMMC3_D3 bit 4 - SDMMC3_D2 bit 3 - SDMMC3_D1 bit 2 - SDMMC3_D0 bit 1 - SDMMC3_CLK bit 0 - SDMMC2_CMD

39.8.265 TS2 SCORE Interrupt Status 2 (cfio_regs_REG_TS2_SCORE_IRQ_TS_2)—Offset 808h

IRQ TS 2 status register

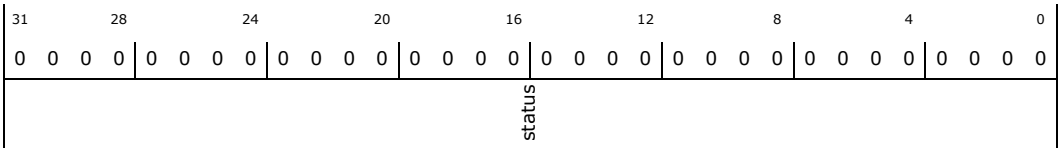
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 808h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RWOC	**Status (status):** Trigger IRQ Status: Write one to clear. This status is reflecting IRQ in MMIO access mode only Bellow is the given list of gpio number and pads, the irq status refers to bit 31 - PWM1 bit 30 - PWM0 bit 29 - I2C_NFC_SCL bit 28 - I2C_NFC_SDA bit 27 - I2C6_SCL bit 26 - I2C6_SDA bit 25 - I2C5_SCL bit 24 - I2C5_SDA bit 23 - I2C4_SCL bit 22 - I2C4_SDA bit 21 - I2C3_SCL bit 20 - I2C3_SDA bit 19 - I2C2_SCL bit 18 - I2C2_SDA bit 17 - I2C1_SCL bit 16 - I2C1_SDA bit 15 - I2C0_SCL bit 14 - I2C0_SDA bit 13 - UART2_CTS_B bit 12 - UART2_RTS_B bit 11 - UART2_TXD bit 10 - UART2_RXD bit 9 - UART1_CTS_B bit 8 - UART1_RTS_B bit 7 - UART1_TXD bit 6 - UART1_RXD bit 5 - SPI1_CLK bit 4 - SPI1_MOSI bit 3 - SPI1_MISO bit 2 - SPI1_CS0_B bit 1 - GP_SSP_2_TXD bit 0 - GP_SSP_2_RXD

39.8.266 TS3 SCORE Interrupt Status 3 (cfio_regs_REG_TS3_SCORE_IRQ_TS_3)—Offset 80Ch

IRQ TS 3 status register

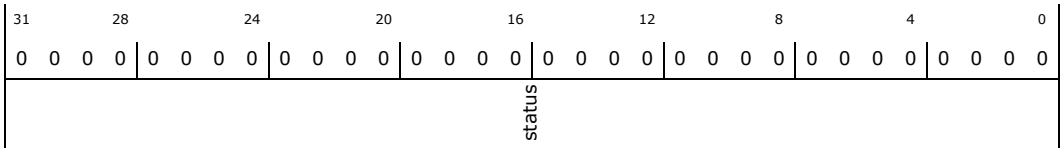
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 80Ch

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RWOC	**Status (status):** Trigger IRQ Status: Write one to clear. This status is reflecting IRQ in MMIO access mode only Bellow is the given list of gpio number and pads, the irq status refers to bit 5 - PLT_CLK5 bit 4 - PLT_CLK4 bit 3 - PLT_CLK3 bit 2 - PLT_CLK2 bit 1 - PLT_CLK1 bit 0 - PLT_CLK0

39.8.267 C71p1cfiomvscoreaza Compensation Configuration (cfio_regs_fam_c71p1cfiomvscoreaza_FAM_RCOMP_CFG)—Offset 810h

FAMs Memory space Value register

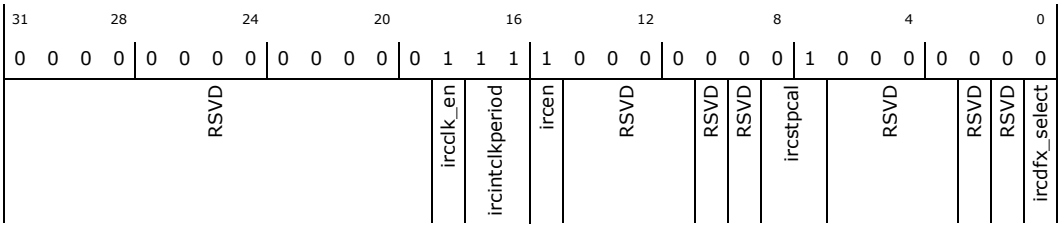
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 810h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00078080h



Bit Range	Default & Access	Field Name (ID): Description
31:19	0000h RO	**Reserved (RSVD):** Reserved.
18	1b RW	**Ircclk En (ircclk_en):** This is enabling the rcomp clock. When rcomp clock is gated, rcomp reset is forced too, so when it is ungated again it will compensate

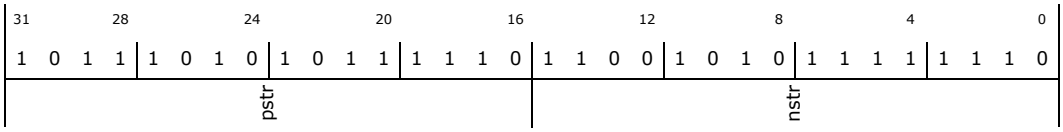
Default: BABECAFEh



Bit Range	Default & Access	Field Name (ID): Description
31:16	babeh RO	**Pstr (pstr):** positive strength - for cfiohvio buffers, only the 2 lsb bits will be used
15:0	cafeh RO	**Nstr (nstr):** negetive strength - for cfiohvio buffers, only the 3 lsb bits will be used

39.8.282 Mmc3 Strength Group (cfio_regs_mmc3_STRENGTH)—Offset 86Ch

P and N strength register

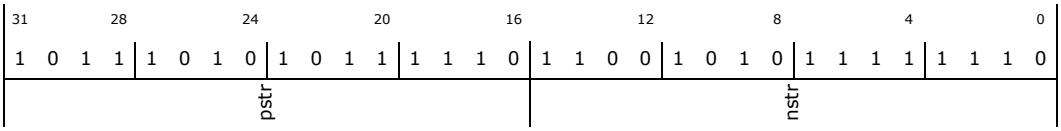
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 86Ch

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: BABECAFEh



Bit Range	Default & Access	Field Name (ID): Description
31:16	babeh RO	**Pstr (pstr):** positive strength - for cfiohvio buffers, only the 2 lsb bits will be used
15:0	cafeh RO	**Nstr (nstr):** negetive strength - for cfiohvio buffers, only the 3 lsb bits will be used

39.8.283 Mvt Mmc3 Strength Group (cfio_regs_mvt_mmc3_STRENGTH)—Offset 870h

P and N strength register

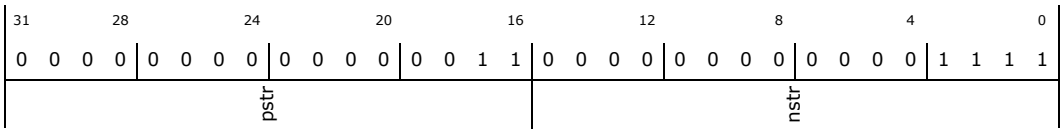
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 870h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 0003000Fh



Bit Range	Default & Access	Field Name (ID): Description
31:16	0003h RW	**Pstr (pstr):** positive strength - for cfiohvio buffers, only the 2 lsb bits will be used
15:0	000Fh RW	**Nstr (nstr):** negetive strength - for cfiohvio buffers, only the 3 lsb bits will be used

39.8.284 Mvt Rcomp Strength Group (cfio_regs_mvt_rcomp_STRENGTH)—Offset 874h

P and N strength register

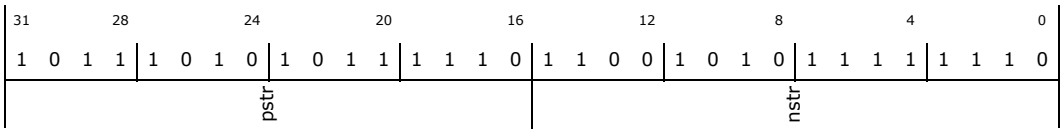
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 874h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: BABECAFEh



Bit Range	Default & Access	Field Name (ID): Description
31:16	babeh RO	**Pstr (pstr):** positive strength - for cfiohvio buffers, only the 2 lsb bits will be used
15:0	cafeh RO	**Nstr (nstr):** negetive strength - for cfiohvio buffers, only the 3 lsb bits will be used

39.8.285 Nfc Strength Group (cfio_regs_nfc_STRENGTH)—Offset 878h

P and N strength register

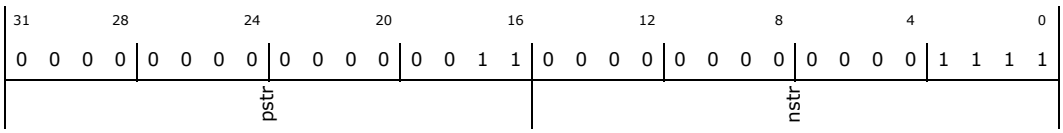
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 878h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 0003000Fh



Bit Range	Default & Access	Field Name (ID): Description
31:16	0003h RW	**Pstr (pstr):** positive strength - for cfiohvio buffers, only the 2 lsb bits will be used
15:0	000Fh RW	**Nstr (nstr):** negetive strength - for cfiohvio buffers, only the 3 lsb bits will be used

39.8.286 Pltclk Strength Group (cfio_regs_pltclk_STRENGTH)—Offset 87Ch

P and N strength register

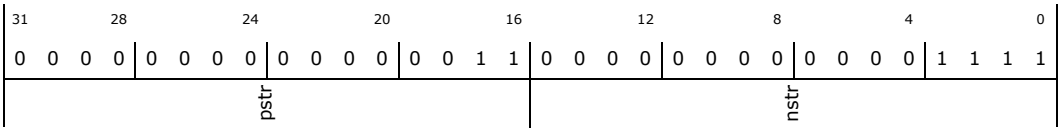
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 87Ch

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 0003000Fh



Bit Range	Default & Access	Field Name (ID): Description
31:16	0003h RW	**Pstr (pstr):** positive strength - for cfiohvio buffers, only the 2 lsb bits will be used
15:0	000Fh RW	**Nstr (nstr):** negetive strength - for cfiohvio buffers, only the 3 lsb bits will be used

39.8.287 Pwm Strength Group (cfio_regs_pwm_STRENGTH)—Offset 880h

P and N strength register

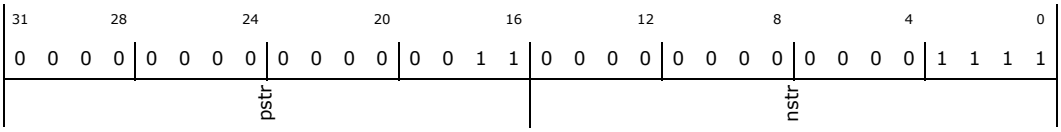
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 880h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 0003000Fh



Bit Range	Default & Access	Field Name (ID): Description
31:16	0003h RW	**Pstr (pstr):** positive strength - for cfiohvio buffers, only the 2 lsb bits will be used

Bit Range	Default & Access	Field Name (ID): Description
15:0	000Fh RW	**Nstr (nstr):** negetive strength - for cfiohvio buffers, only the 3 lsb bits will be used

39.8.288 Sata Strength Group (cfio_regs_sata_STRENGTH)—Offset 884h

P and N strength register

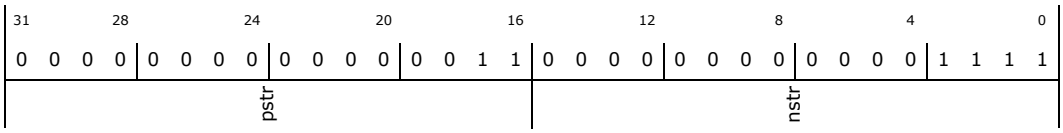
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 884h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 0003000Fh



Bit Range	Default & Access	Field Name (ID): Description
31:16	0003h RW	**Pstr (pstr):** positive strength - for cfiohvio buffers, only the 2 lsb bits will be used
15:0	000Fh RW	**Nstr (nstr):** negetive strength - for cfiohvio buffers, only the 3 lsb bits will be used

39.8.289 Smb Strength Group (cfio_regs_smb_STRENGTH)—Offset 888h

P and N strength register

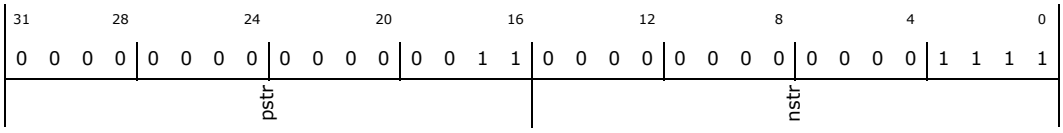
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 888h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 0003000Fh



Bit Range	Default & Access	Field Name (ID): Description
31:16	0003h RW	**Pstr (pstr):** positive strength - for cfiohvio buffers, only the 2 lsb bits will be used
15:0	000Fh RW	**Nstr (nstr):** negetive strength - for cfiohvio buffers, only the 3 lsb bits will be used

39.8.290 Spi Strength Group (cfio_regs_spi_STRENGTH)—Offset 88Ch

P and N strength register

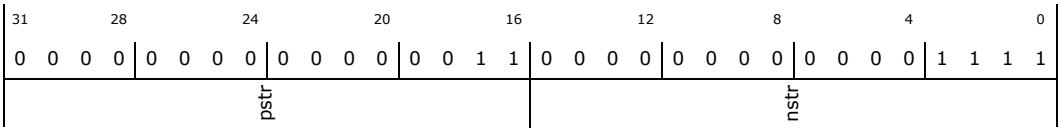
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 88Ch

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 0003000Fh



Bit Range	Default & Access	Field Name (ID): Description
31:16	0003h RW	**Pstr (pstr):** positive strength - for cfiohvio buffers, only the 2 lsb bits will be used
15:0	000Fh RW	**Nstr (nstr):** negetive strength - for cfiohvio buffers, only the 3 lsb bits will be used

39.8.291 Spkr Strength Group (cfio_regs_spkr_STRENGTH)—Offset 890h

P and N strength register

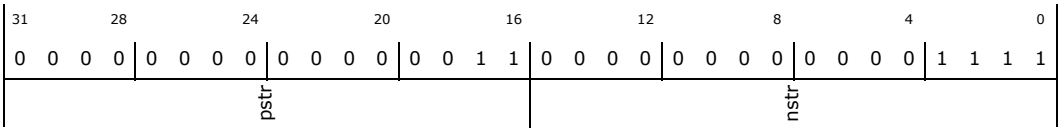
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 890h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 0003000Fh



Bit Range	Default & Access	Field Name (ID): Description
31:16	0003h RW	**Pstr (pstr):** positive strength - for cfiohvio buffers, only the 2 lsb bits will be used
15:0	000Fh RW	**Nstr (nstr):** negetive strength - for cfiohvio buffers, only the 3 lsb bits will be used

39.8.292 Ssp Strength Group (cfio_regs_ssp_STRENGTH)—Offset 894h

P and N strength register

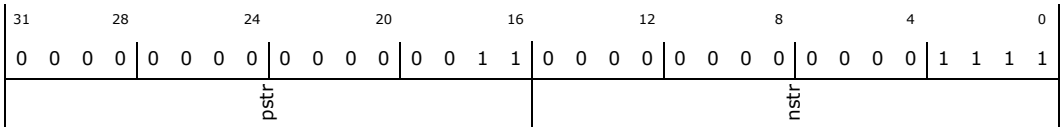
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 894h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 0003000Fh



Bit Range	Default & Access	Field Name (ID): Description
31:16	0003h RW	**Pstr (pstr):** positive strength - for cfiohvio buffers, only the 2 lsb bits will be used
15:0	000Fh RW	**Nstr (nstr):** negetive strength - for cfiohvio buffers, only the 3 lsb bits will be used

39.8.293 Uart1 Strength Group (cfio_regs_uart1_STRENGTH)—Offset 898h

P and N strength register

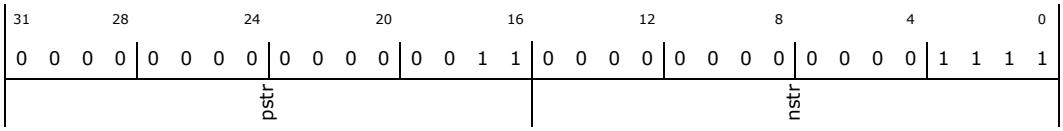
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 898h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 0003000Fh



Bit Range	Default & Access	Field Name (ID): Description
31:16	0003h RW	**Pstr (pstr):** positive strength - for cfiohvio buffers, only the 2 lsb bits will be used
15:0	000Fh RW	**Nstr (nstr):** negetive strength - for cfiohvio buffers, only the 3 lsb bits will be used

39.8.294 WR PATH SCORE Master Delay Line Write Address (cfio_regs_DLL_WR_PATH_SCORE_MDL_WRITE_PATH_C_F_ADDR)—Offset 950h

Master delay line write path values

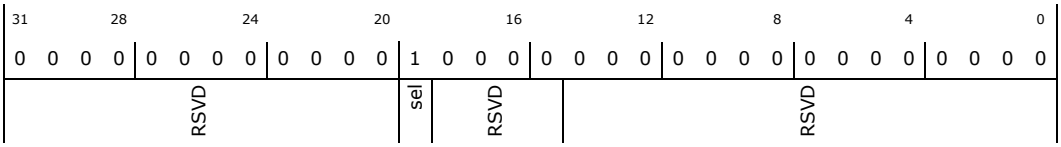
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 950h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00080000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RO	**Reserved (RSVD):** Reserved.
19	1b RW	**Sel (sel):** 0 - Enable Master DLL tuning 1 - Disable Master DLL tuning.
18:15	0000b RO	**Reserved (RSVD):** Reserved.
14:0	0h RO	**Reserved (RSVD):** Reserved.

39.8.295 WR PATH1 MUX SCORE Delay Line Write Multiplexer 1 (cfio_regs_DLL_WR_PATH1_MUX_SCORE_DLL_WRITE_PATH1_MUX)—Offset 954h

Master delay line write path mux values

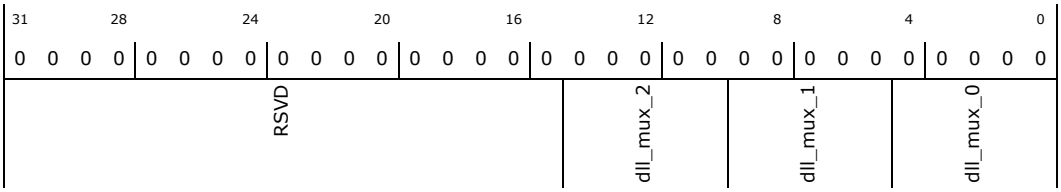
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 954h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
14:10	0h RW	**Dll Mux 2 (dll_mux_2):** SD-Card TX Slave DLL tap select for DDR Mode. Adjusts TX Clk to Data spacing in 250ps steps. Valid values are 0 to 10011 (0 to 19 for 0 to 5ns range). Recommended value is 3.5ns (5'b01101).
9:5	0h RW	**Dll Mux 1 (dll_mux_1):** SDIO TX Slave DLL tap select for DDR Mode. Adjusts TX Clk to Data spacing in 250ps steps. Valid values are 0 to 10011 (0 to 19 for 0 to 5ns range). Recommended value is 3.5ns (5'b01101).
4:0	0h RW	**Dll Mux 0 (dll_mux_0):** eMMC TX Slave DLL tap select for DDR Mode. Adjusts TX Clk to Data spacing in 250ps steps. Valid values are 0 to 10011 (0 to 19 for 0 to 5ns range). Recommended value is 3.5ns (5'b01101).

39.8.296 WR PATH2 MUX SCORE Delay Line Write Multiplexer 2 (cfio_regs_DLL_WR_PATH2_MUX_SCORE_DLL_WRITE_PATH2_MUX)—Offset 958h

Master delay line write path mux values

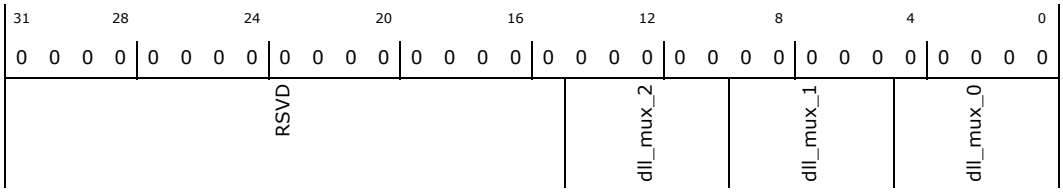
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 958h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD):** Reserved.
14:10	0h RW	**Dll Mux 2 (dll_mux_2):** SD-Card TX Slave DLL tap select for HS Mode. Adjusts TX Clk to Data spacing in 250ps steps. Valid values are 0 to 10011 (0 to 19 for 0 to 5ns range). Recommended value is 3.5ns (5'b01101).
9:5	0h RW	**Dll Mux 1 (dll_mux_1):** SDIO TX Slave DLL tap select for HS Mode. Adjusts TX Clk to Data spacing in 250ps steps. Valid values are 0 to 10011 (0 to 19 for 0 to 5ns range). Recommended value is 3.5ns (5'b01101).
4:0	0h RW	**Dll Mux 0 (dll_mux_0):** eMMC TX Slave DLL tap select for HS Mode. Adjusts TX Clk to Data spacing in 250ps steps. Valid values are 0 to 10011 (0 to 19 for 0 to 5ns range). Recommended value is 3.5ns (5'b01101).

39.8.297 WR PATH3 MUX SCORE Delay Line Write Multiplexer 3 (cfio_regs_DLL_WR_PATH3_MUX_SCORE_DLL_WRITE_PATH3_MUX)—Offset 95Ch

Master delay line write path mux values

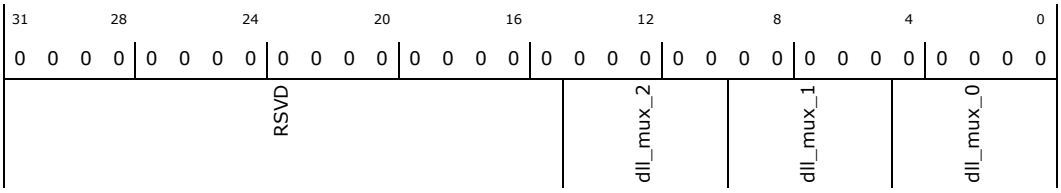
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 95Ch

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD):** Reserved.
14:10	0h RW	**Dll Mux 2 (dll_mux_2):** SD-Card TX Slave DLL tap select for FS Mode. Adjusts TX Clk to Data spacing in 250ps steps. Valid values are 0 to 10011 (0 to 19 for 0 to 5ns range). Recommended value is 3.5ns (5'b01101).
9:5	0h RW	**Dll Mux 1 (dll_mux_1):** SDIO TX Slave DLL tap select for FS Mode. Adjusts TX Clk to Data spacing in 250ps steps. Valid values are 0 to 10011 (0 to 19 for 0 to 5ns range). Recommended value is 3.5ns (5'b01101).
4:0	0h RW	**Dll Mux 0 (dll_mux_0):** eMMC TX Slave DLL tap select for FS Mode. Adjusts TX Clk to Data spacing in 250ps steps. Valid values are 0 to 10011 (0 to 19 for 0 to 5ns range). Recommended value is 3.5ns (5'b01101).

39.8.298 CTRL SCORE Master Delay Line Fsm Control (cfio_regs_DLL_CTRL_SCORE_MDL_FSM_CTRL)—Offset 970h

Master delay line fsm controller

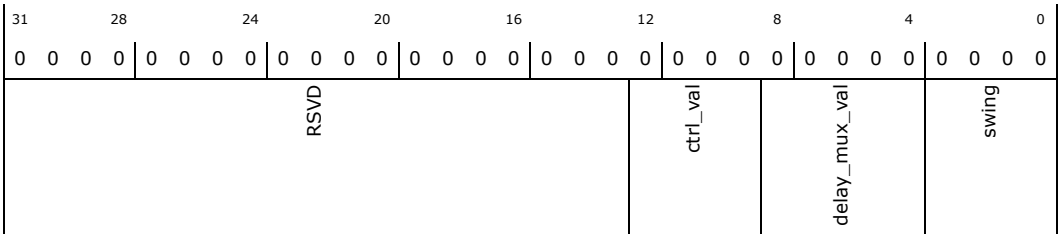
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 970h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved (RSVD):** Reserved.
12:9	0b RW	**Ctrl Val (ctrl_val):** fsm control value bit 3: Local Reset 2: Enable FSM 1: Reseved for debug 0: recalibrate
8:4	00000b RW	**Delay Mux Val (delay_mux_val):** fsm delay mux value to select how many delay cells master dll should use to lock on 5ns. If value is too low, DLL might not succeed to lock. Recomended value is 19 (highest posible), to allow smallest margin.
3:0	0000b RW	**Swing (swing):** number of swings untill the lock in the fsm (from the cfio register). Recomended value 3.

39.8.299 DIRECT IRQ0 SCORE Direct Interrupt Multiplexer 0 (cfio_regs_REG_DIRECT_IRQ0_SCORE_DIRECT_IRQ_0)—Offset 980h

Direct irq select register for irq 0 - 3.

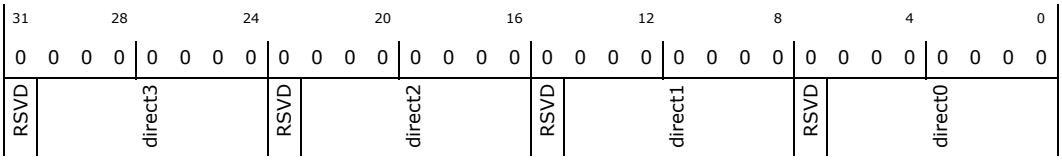
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 980h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	**Reserved (RSVD):** Reserved.
30:24	0000000b RW	**Direct3 (direct3):** Selects the 3rd direct irq.

6:0	0000000b RW	**Direct12 (direct12):** Selects the 12th direct irq. S

39.8.303 E Emmc 4.5 max high speed mux (cfio_regs_SCORE_EMMC_45_HSMAX)—Offset 9A4h

Setting the DLL mux when highest speed is selected

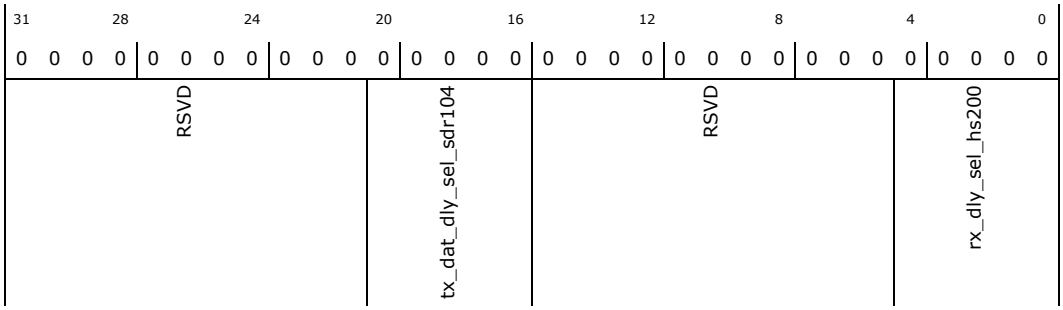
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 9A4h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD):** Reserved.
20:16	0b RW	**Tx Dat Dly Sel Sdr104 (tx_dat_dly_sel_sdr104):** Set the tx delay for sdr104 for eMMC 4.5 clock. Recommended value is 1.5ns (5'b00101).
15:5	0h RO	**Reserved (RSVD):** Reserved.
4:0	0b RW	**Rx Dly Sel Hs200 (rx_dly_sel_hs200):** Set the rx delay for hs200 for eMMC 4.5 clock. Recommended value is 1.5ns (5'b00101).

39.8.304 E Emmc 4.5 sdr50 speed mux (cfio_regs_SCORE_EMMC_45_SDR50)—Offset 9A8h

Setting the DLL mux when sdr50 speed is selected

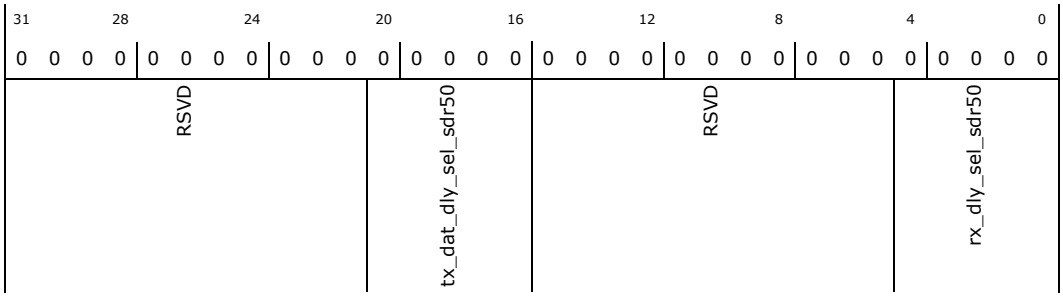
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 9A8h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
20:16	0b RW	**Tx Dat Dly Sel Sdr50 (tx_dat_dly_sel_sdr50):** Set the tx delay for sdr50 for eMMC 4.5 clock. Recommended value is 3.5ns (5'b01101).
15:5	0h RO	**Reserved (RSVD):** Reserved.
4:0	0b RW	**Rx Dly Sel Sdr50 (rx_dly_sel_sdr50):** Set the rx delay for sdr50 for eMMC 4.5 clock. Recommended value is 3.5ns (5'b01101).

39.8.305 E Emmc 4.5 ddr50 speed mux (cfio_regs_SCORE_EMMC_45_DDR50)—Offset 9ACh

Setting the DLL mux when ddr50 speed is selected and 1.8v is used

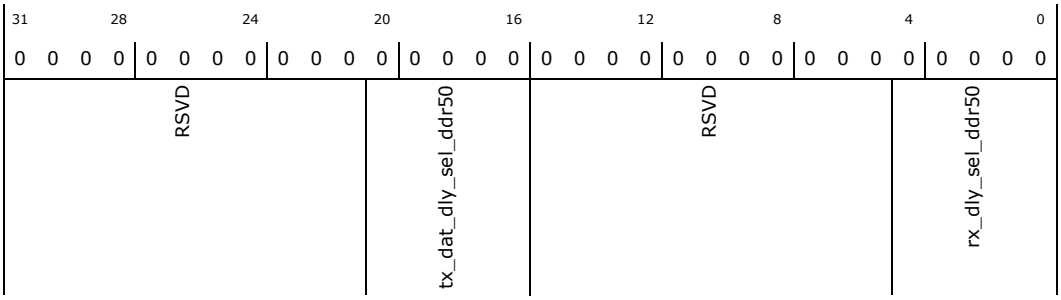
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 9ACh

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD):** Reserved.
20:16	0b RW	**Tx Dat Dly Sel Ddr50 (tx_dat_dly_sel_ddr50):** Set the tx delay for ddr50 for eMMC 4.5 clock. Recommended value is 3.5ns (5'b01101).
15:5	0h RO	**Reserved (RSVD):** Reserved.
4:0	0b RW	**Rx Dly Sel Ddr50 (rx_dly_sel_ddr50):** Set the rx delay for ddr50 for eMMC 4.5 clock. Recommended value is 3.5ns (5'b01101).

39.8.306 E Emmc 4.5 hs speed mux (cfio_regs_SCORE_EMMC_45_HS)—Offset 9B0h

Setting the DLL mux when 1. hs speed is selected or 2. ddr 50 and 1.8V Signaling Enable is set to 0. The SDMCC1 IO will still use 1.8V.

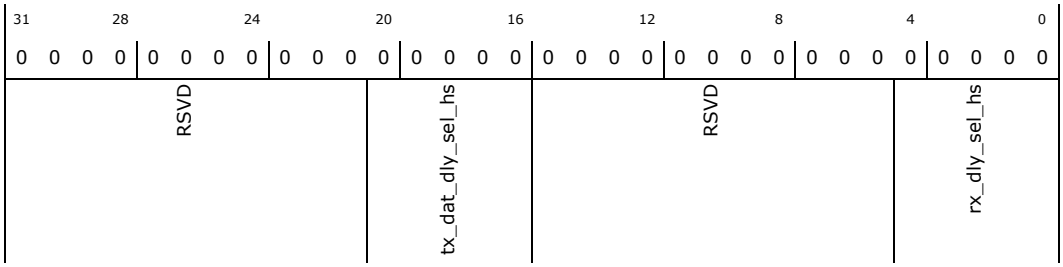
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 9B0h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD):** Reserved.
20:16	0b RW	**Tx Dat Dly Sel Hs (tx_dat_dly_sel_hs):** Set the tx delay for hs for eMMC 4.5 clock. Recommended value is 3.5ns (5'b01101).
15:5	0h RO	**Reserved (RSVD):** Reserved.
4:0	0b RW	**Rx Dly Sel Hs (rx_dly_sel_hs):** Set the rx delay for hs for eMMC 4.5 clock. Recommended value is 3.5ns (5'b01101).

39.8.307 E Emmc 4.5 norm speed mux (cfio_regs_SCORE_EMMC_45_NORM)—Offset 9B4h

Setting the DLL mux when norm speed is selected

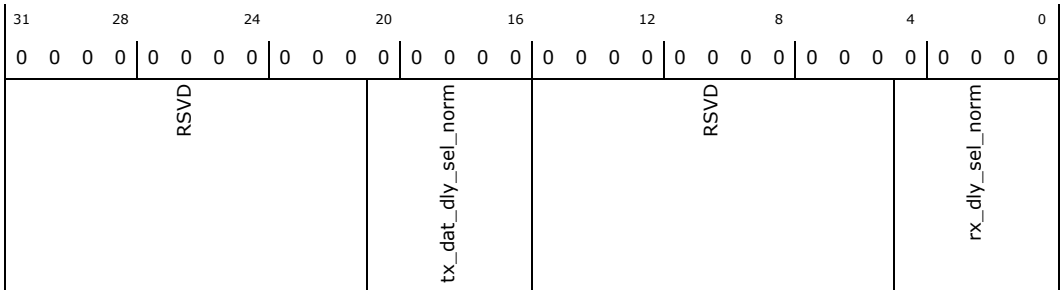
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 9B4h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD):** Reserved.
20:16	0b RW	**Tx Dat Dly Sel Norm (tx_dat_dly_sel_norm):** Set the tx delay for norm for eMMC 4.5 clock. Recommended value is 3.5ns (5'b01101).
15:5	0h RO	**Reserved (RSVD):** Reserved.
4:0	0b RW	**Rx Dly Sel Norm (rx_dly_sel_norm):** Set the rx delay for norm for eMMC 4.5 clock. Recommended value is 3.5ns (5'b01101).

39.8.308 E Special configuration bits (cfio_regs_SCORE_SPECIAL_BITS)—Offset 9C0h

The register is holding enable bits for last minutes features, like Mipi hsi active and SDcard input disable when power down

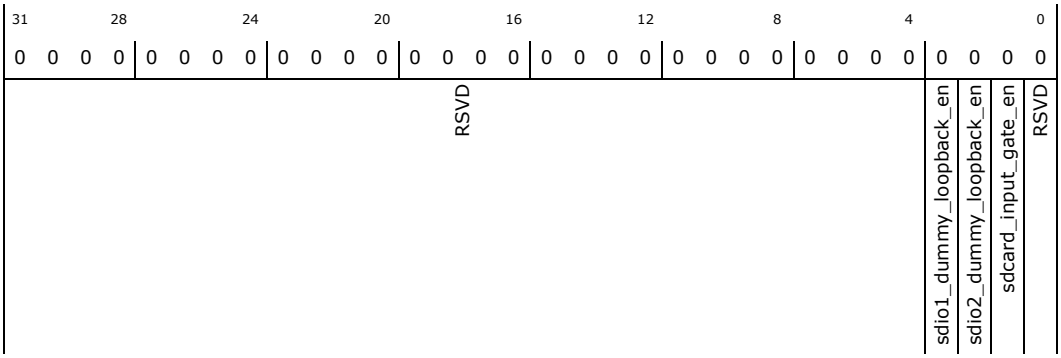
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 9C0h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD):** Reserved.
3	0b RW	**Sdio1 Dummy Loopback En (sdio1_dummy_loopback_en):** Enable dummy pad loopback to avoid board reflection, for eMMC (4.4.1 and 4.5)
2	0b RW	**Sdio2 Dummy Loopback En (sdio2_dummy_loopback_en):** Enable dummy pad loopback to avoid board reflection, for sdio

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW	**Sdcard Input Gate En (sdcard_input_gate_en):** Enable input disable when sd card power is down. Affect SD card input pads only SDMMC3_D0 SDMMC3_D1 SDMMC3_D2 SDMMC3_D3 SDMMC3_CMD
0	0b RO	**Reserved (RSVD):** Reserved.

39.8.309 E Debounce Control (cfio_regs_SCORE_DEBOUNCE_CTRL)—Offset 9D0h

The register is controlling the community debounce

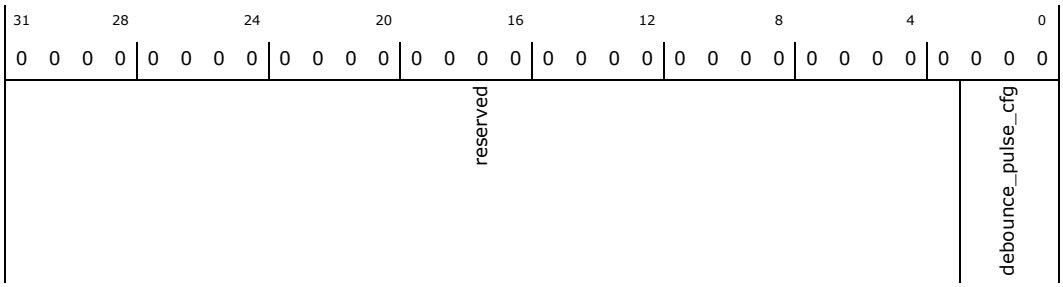
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 9D0h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (reserved):** reserved
2:0	0h RW	**Debounce Pulse Cfg (debounce_pulse_cfg):** This will divide the rtc clock, for generating the pulse of the debounce. When all cleared, pulse will be always high. 3'b001 375us debounce 3'b010 750us debounce 3'b011 1.5ms debounce 3'b100 3ms debounce 3'b101 6ms debounce 3'b110 12ms debounce 3'b111 24ms debounce Recomended values are between 3 to 12 ms

39.8.310 E eMMC 4.5 TAP select register (cfio_regs_SCORE_TAP_SEL_REG)—Offset 9F4h

The register is controlling the community debounce

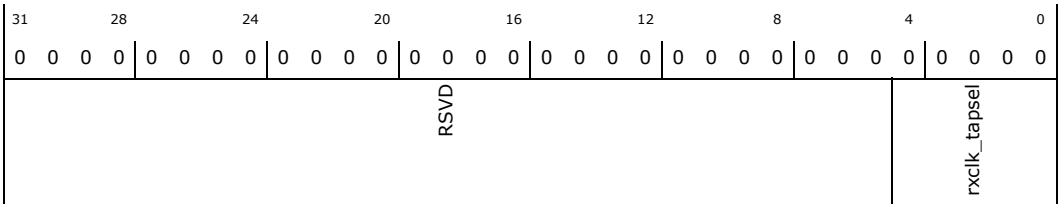
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE] + 9F4h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved (RSVD):** Reserved.
4:0	0h RO	**Rxclk Tapsel (rxclk_tapsel):** This is the actual tap select value for the rx clock of eMMC 4.5

39.9 PCU iLB GPIO S5 IO Addressed Registers

Table 341. Summary of PCU iLB GPIO S5 IO Registers—GBASE + 80h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"Sus Use Select 1 (cfio_ioreg_SUS_USE_SEL_31_0_)—Offset 0h" on page 5059	00000000h
4–7h	4	"Sus Io Select 1 (cfio_ioreg_SUS_IO_SEL_31_0_)—Offset 4h" on page 5060	00000000h
8–Bh	4	"Sus Gpio Level 1 (cfio_ioreg_SUS_GP_LVL_31_0_)—Offset 8h" on page 5061	00000000h
C–Fh	4	"Sus Trigger Positive Edge Enable 1 (cfio_ioreg_SUS_TPE_31_0_)—Offset Ch" on page 5062	00000000h
10–13h	4	"Sus Trigger Negative Edge Enable 1 (cfio_ioreg_SUS_TNE_31_0_)—Offset 10h" on page 5063	00000000h
14–17h	4	"Sus Trigger Status 1 (cfio_ioreg_SUS_TS_31_0_)—Offset 14h" on page 5063	00000000h
18–1Bh	4	"Sus Wake Enable 1 (cfio_ioreg_SUS_WAKE_EN_31_0_)—Offset 18h" on page 5065	00000000h
20–23h	4	"Sus Use Select 2 (cfio_ioreg_SUS_USE_SEL_43_32_)—Offset 20h" on page 5066	00000000h
24–27h	4	"Sus Io Select 2 (cfio_ioreg_SUS_IO_SEL_43_32_)—Offset 24h" on page 5066	00000000h
28–2Bh	4	"Sus Gpio Level 2 (cfio_ioreg_SUS_GP_LVL_43_32_)—Offset 28h" on page 5067	00000000h
2C–2Fh	4	"Sus Trigger Positive Edge Enable 2 (cfio_ioreg_SUS_TPE_43_32_)—Offset 2Ch" on page 5068	00000000h
30–33h	4	"Sus Trigger Negative Edge Enable 2 (cfio_ioreg_SUS_TNE_43_32_)—Offset 30h" on page 5069	00000000h
34–37h	4	"Sus Trigger Status (cfio_ioreg_SUS_TS_43_32_)—Offset 34h" on page 5070	00000000h
38–3Bh	4	"Sus Wake Enable 2 (cfio_ioreg_SUS_WAKE_EN_43_32_)—Offset 38h" on page 5071	00000000h

39.9.1 Sus Use Select 1 (cfio_ioreg_SUS_USE_SEL_31_0_)—Offset 0h

Access via PCU Proxy, the register is setting the corresponding GPIO to be selected and to be changed to IO access instead of the default Memory access. Bit 0 will set GPIO[0], and bit 1 will set GPIO[1] and so on. The default of IO GPIO pad is input so pull must be activated in the pad pconf0 register.

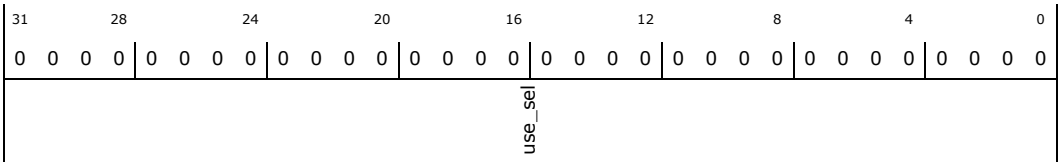
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE + 80h] + 0h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Use Select (use_sel):** bit 31 - USB_ULPI_0_CLK bit 30 - GPIO_DFX8 bit 29 - GPIO_DFX7 bit 28 - GPIO_DFX6 bit 27 - GPIO_DFX5 bit 26 - GPIO_DFX4 bit 25 - GPIO_DFX3 bit 24 - GPIO_DFX2 bit 23 - GPIO_DFX1 bit 22 - GPIO_DFX0 bit 21 - SPI_CS1_B bit 20 - USB_OC1_B bit 19 - USB_OC0_B bit 18 - SUS_STAT_B bit 17 - PMU_WAKE_LAN_B bit 16 - PMU_PWRBTN_B bit 15 - PMU_WAKE_B bit 14 - PMU_SLP_LAN_B bit 13 - PMU_SLP_S0IX_B bit 12 - PMU_SUSCLK bit 11 - SUSPWRDNACK bit 10 - SEC_GPIO_SUS10 bit 9 - SEC_GPIO_SUS9 bit 8 - SEC_GPIO_SUS8 bit 7 - GPIO_SUS7 bit 6 - GPIO_SUS6 bit 5 - GPIO_SUS5 bit 4 - GPIO_SUS4 bit 3 - GPIO_SUS3 bit 2 - GPIO_SUS2 bit 1 - GPIO_SUS1 bit 0 - GPIO_SUS0

39.9.2 Sus Io Select 1 (cfio_ioreg_SUS_IO_SEL_31_0_)—Offset 4h

Access via PCU Proxy, it defines Input Output Select: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO_USE_SEL register) is programmed as an input. When set to 0, the GPIO signal is programmed as an output - Only the 8 lsb are used in VLV. Default values will be read as 0 if IO is not used

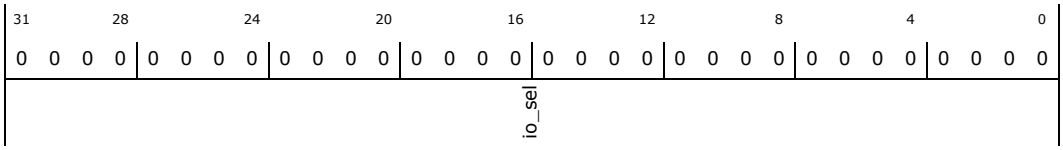
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE + 80h] + 4h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Io Select (io_sel):** bit 31 - USB_ULPI_0_CLK bit 30 - GPIO_DFX8 bit 29 - GPIO_DFX7 bit 28 - GPIO_DFX6 bit 27 - GPIO_DFX5 bit 26 - GPIO_DFX4 bit 25 - GPIO_DFX3 bit 24 - GPIO_DFX2 bit 23 - GPIO_DFX1 bit 22 - GPIO_DFX0 bit 21 - SPI_CS1_B bit 20 - USB_OC1_B bit 19 - USB_OC0_B bit 18 - SUS_STAT_B bit 17 - PMU_WAKE_LAN_B bit 16 - PMU_PWRBTN_B bit 15 - PMU_WAKE_B bit 14 - PMU_SLP_LAN_B bit 13 - PMU_SLP_S0IX_B bit 12 - PMU_SUSCLK bit 11 - SUSPWRDNACK bit 10 - SEC_GPIO_SUS10 bit 9 - SEC_GPIO_SUS9 bit 8 - SEC_GPIO_SUS8 bit 7 - GPIO_SUS7 bit 6 - GPIO_SUS6 bit 5 - GPIO_SUS5 bit 4 - GPIO_SUS4 bit 3 - GPIO_SUS3 bit 2 - GPIO_SUS2 bit 1 - GPIO_SUS1 bit 0 - GPIO_SUS0

39.9.3 Sus Gpio Level 1 (cfio_ioreg_SUS_GP_LVL_31_0_)—Offset 8h

Access via PCU Proxy, the registers are implemented as dual read/write with dedicated storage for write. Write value will be stored in the write register, while read is coming from the pad directly. If GPIO(n) is programmed to be an output (via the corresponding bit in the GP_IO_SEL register), then the corresponding GP_LVL(n) write register value will drive a high or low value on the output pin. 1 = high, 0 = low. - Only the 8 lsb are used in VLV

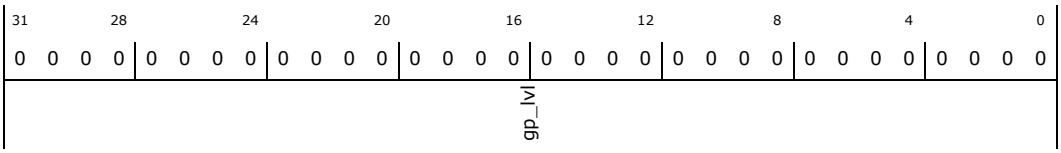
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE + 80h] + 8h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Gpio Level (gp_lvl):** bit 31 - USB_ULPI_0_CLK bit 30 - GPIO_DFX8 bit 29 - GPIO_DFX7 bit 28 - GPIO_DFX6 bit 27 - GPIO_DFX5 bit 26 - GPIO_DFX4 bit 25 - GPIO_DFX3 bit 24 - GPIO_DFX2 bit 23 - GPIO_DFX1 bit 22 - GPIO_DFX0 bit 21 - SPI_CS1_B bit 20 - USB_OC1_B bit 19 - USB_OC0_B bit 18 - SUS_STAT_B bit 17 - PMU_WAKE_LAN_B bit 16 - PMU_PWRBTN_B bit 15 - PMU_WAKE_B bit 14 - PMU_SLP_LAN_B bit 13 - PMU_SLP_S0IX_B bit 12 - PMU_SUSCLK bit 11 - SUSPWRDNACK bit 10 - SEC_GPIO_SUS10 bit 9 - SEC_GPIO_SUS9 bit 8 - SEC_GPIO_SUS8 bit 7 - GPIO_SUS7 bit 6 - GPIO_SUS6 bit 5 - GPIO_SUS5 bit 4 - GPIO_SUS4 bit 3 - GPIO_SUS3 bit 2 - GPIO_SUS2 bit 1 - GPIO_SUS1 bit 0 - GPIO_SUS0

39.9.4 Sus Trigger Positive Edge Enable 1 (cfio_ioreg_SUS_TPE_31_0_)—Offset Ch

Access via PCU Proxy, the register trigger Positive Edge Enable: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO_USE_SEL register) will case an GPE or SMI when a 0 to 1 transition occurs. When set to 0, the GPIO signal is not enabled to trigger an GPE or SMI on a 0 to 1 transition. - Only the 8 lsb are used in VLV

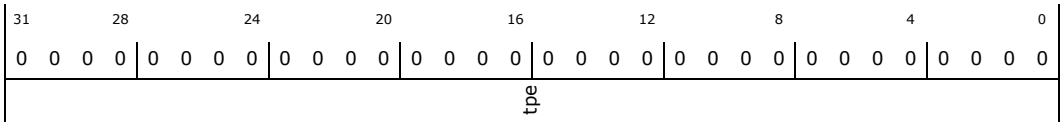
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE + 80h] + Ch

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Tpe (tpe):** bit 31 - USB_ULPI_0_CLK bit 30 - GPIO_DFX8 bit 29 - GPIO_DFX7 bit 28 - GPIO_DFX6 bit 27 - GPIO_DFX5 bit 26 - GPIO_DFX4 bit 25 - GPIO_DFX3 bit 24 - GPIO_DFX2 bit 23 - GPIO_DFX1 bit 22 - GPIO_DFX0 bit 21 - SPI_CS1_B bit 20 - USB_OC1_B bit 19 - USB_OC0_B bit 18 - SUS_STAT_B bit 17 - PMU_WAKE_LAN_B bit 16 - PMU_PWRBTN_B bit 15 - PMU_WAKE_B bit 14 - PMU_SLP_LAN_B bit 13 - PMU_SLP_S0IX_B bit 12 - PMU_SUSCLK bit 11 - SUSPWRDNACK bit 10 - SEC_GPIO_SUS10 bit 9 - SEC_GPIO_SUS9 bit 8 - SEC_GPIO_SUS8 bit 7 - GPIO_SUS7 bit 6 - GPIO_SUS6 bit 5 - GPIO_SUS5 bit 4 - GPIO_SUS4 bit 3 - GPIO_SUS3 bit 2 - GPIO_SUS2 bit 1 - GPIO_SUS1 bit 0 - GPIO_SUS0

39.9.5 Sus Trigger Negative Edge Enable 1 (cfio_ioreg_SUS_TNE_31_0_)—Offset 10h

Access via PCU Proxy, the register trigger Negative Edge Enable: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO_USE_SEL register) will case an GPE or SMI when a 1 to 0 transition occurs. When set to 0, the GPIO signal is not enabled to trigger an GPE or SMI on a 1 to 0 transition. - Only the 8 lsb are used in VLV

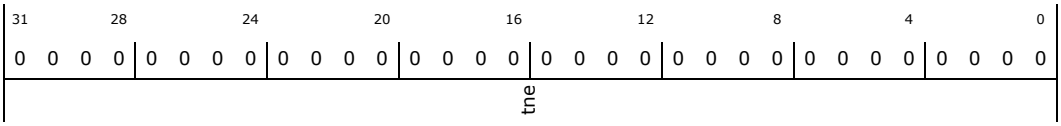
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE + 80h] + 10h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Tne (tne):** bit 31 - USB_ULPI_0_CLK bit 30 - GPIO_DFX8 bit 29 - GPIO_DFX7 bit 28 - GPIO_DFX6 bit 27 - GPIO_DFX5 bit 26 - GPIO_DFX4 bit 25 - GPIO_DFX3 bit 24 - GPIO_DFX2 bit 23 - GPIO_DFX1 bit 22 - GPIO_DFX0 bit 21 - SPI_CS1_B bit 20 - USB_OC1_B bit 19 - USB_OC0_B bit 18 - SUS_STAT_B bit 17 - PMU_WAKE_LAN_B bit 16 - PMU_PWRBTN_B bit 15 - PMU_WAKE_B bit 14 - PMU_SLP_LAN_B bit 13 - PMU_SLP_S0IX_B bit 12 - PMU_SUSCLK bit 11 - SUSPWRDNACK bit 10 - SEC_GPIO_SUS10 bit 9 - SEC_GPIO_SUS9 bit 8 - SEC_GPIO_SUS8 bit 7 - GPIO_SUS7 bit 6 - GPIO_SUS6 bit 5 - GPIO_SUS5 bit 4 - GPIO_SUS4 bit 3 - GPIO_SUS3 bit 2 - GPIO_SUS2 bit 1 - GPIO_SUS1 bit 0 - GPIO_SUS0

39.9.6 Sus Trigger Status 1 (cfio_ioreg_SUS_TS_31_0_)—Offset 14h

Access via PCU Proxy, When set to a 1, the corresponding GPIO (if enabled in the GPIO_USE_SEL register) if enabled as input via IO_SEL(n), triggered an GPE or SMI. This will be set if a 0 to 1 transition occurred and TPE(n) was set, or a 1 to 0 transition occurred and TNE(n) was set. If both TPE(n) and TNE(n) are set, then this bit will be set on both a 0 to 1 and a 1 to 0 transition. This bit will not be set if the GPIO is configured as an output. - Only the 8 lsb are used in VLV and it cannot be tested by the host

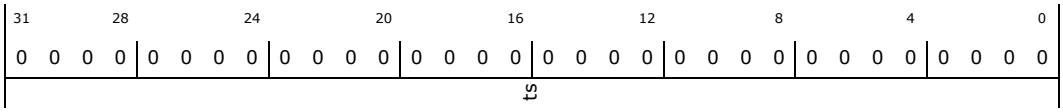
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE + 80h] + 14h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WOC	**Ts (ts):** bit 31 - USB_ULPI_0_CLK bit 30 - GPIO_DFX8 bit 29 - GPIO_DFX7 bit 28 - GPIO_DFX6 bit 27 - GPIO_DFX5 bit 26 - GPIO_DFX4 bit 25 - GPIO_DFX3 bit 24 - GPIO_DFX2 bit 23 - GPIO_DFX1 bit 22 - GPIO_DFX0 bit 21 - SPI_CS1_B bit 20 - USB_OC1_B bit 19 - USB_OC0_B bit 18 - SUS_STAT_B bit 17 - PMU_WAKE_LAN_B bit 16 - PMU_PWRBTN_B bit 15 - PMU_WAKE_B bit 14 - PMU_SLP_LAN_B bit 13 - PMU_SLP_S0IX_B bit 12 - PMU_SUSCLK bit 11 - SUSPWRDNACK bit 10 - SEC_GPIO_SUS10 bit 9 - SEC_GPIO_SUS9 bit 8 - SEC_GPIO_SUS8 bit 7 - GPIO_SUS7 bit 6 - GPIO_SUS6 bit 5 - GPIO_SUS5 bit 4 - GPIO_SUS4 bit 3 - GPIO_SUS3 bit 2 - GPIO_SUS2 bit 1 - GPIO_SUS1 bit 0 - GPIO_SUS0

39.9.7 Sus Wake Enable 1 (cfio_ioreg_SUS_WAKE_EN_31_0_)—Offset 18h

Access via PCU Proxy, Wake Enable: When set to a 1 and TS(n) is set, wake event should be initiated. - Only the 8 lsb are used in VLV

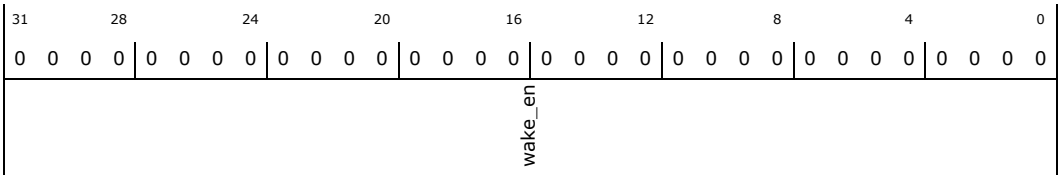
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE + 80h] + 18h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Wake Enable (wake_en):** bit 31 - USB_ULPI_0_CLK bit 30 - GPIO_DFX8 bit 29 - GPIO_DFX7 bit 28 - GPIO_DFX6 bit 27 - GPIO_DFX5 bit 26 - GPIO_DFX4 bit 25 - GPIO_DFX3 bit 24 - GPIO_DFX2 bit 23 - GPIO_DFX1 bit 22 - GPIO_DFX0 bit 21 - SPI_CS1_B bit 20 - USB_OC1_B bit 19 - USB_OC0_B bit 18 - SUS_STAT_B bit 17 - PMU_WAKE_LAN_B bit 16 - PMU_PWRBTN_B bit 15 - PMU_WAKE_B bit 14 - PMU_SLP_LAN_B bit 13 - PMU_SLP_S0IX_B bit 12 - PMU_SUSCLK bit 11 - SUSPWRDNACK bit 10 - SEC_GPIO_SUS10 bit 9 - SEC_GPIO_SUS9 bit 8 - SEC_GPIO_SUS8 bit 7 - GPIO_SUS7 bit 6 - GPIO_SUS6 bit 5 - GPIO_SUS5 bit 4 - GPIO_SUS4 bit 3 - GPIO_SUS3 bit 2 - GPIO_SUS2 bit 1 - GPIO_SUS1 bit 0 - GPIO_SUS0

39.9.8 Sus Use Select 2 (cfio_ioreg_SUS_USE_SEL_43_32_)—Offset 20h

Access via PCU Proxy, the register is setting the correspanding GPIO to be selected and to be changed to IO access instead of the default Memory access. Bit 0 will set GPIO[0], and bit 1 will set GPIO[1] and so on. The default of IO GPIO pad is input so pull must be activated in the pad pconf0 register.

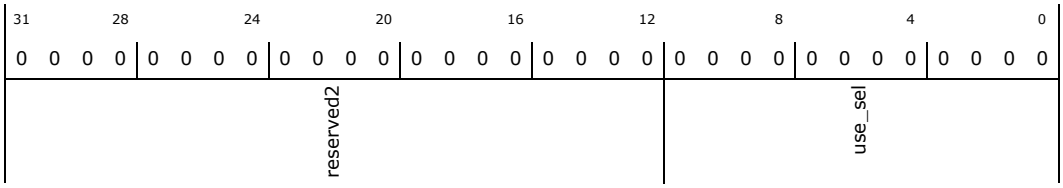
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE + 80h] + 20h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (reserved2):** Reserved.
11:0	0h RW	**Use Select (use_sel):** bit 11 - USB_ULPI_0_REFCLK bit 10 - USB_ULPI_0_STP bit 9 - USB_ULPI_0_NXT bit 8 - USB_ULPI_0_DIR bit 7 - USB_ULPI_0_DATA7 bit 6 - USB_ULPI_0_DATA6 bit 5 - USB_ULPI_0_DATA5 bit 4 - USB_ULPI_0_DATA4 bit 3 - USB_ULPI_0_DATA3 bit 2 - USB_ULPI_0_DATA2 bit 1 - USB_ULPI_0_DATA1 bit 0 - USB_ULPI_0_DATA0

39.9.9 Sus Io Select 2 (cfio_ioreg_SUS_IO_SEL_43_32_)—Offset 24h

Access via PCU Proxy, it defines Input Output Select: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO_USE_SEL register) is programmed as an input. When set to 0, the GPIO signal is programmed as an output - Only the 8 lsb are used in VLV. Default values will be read as 0 if IO is not used

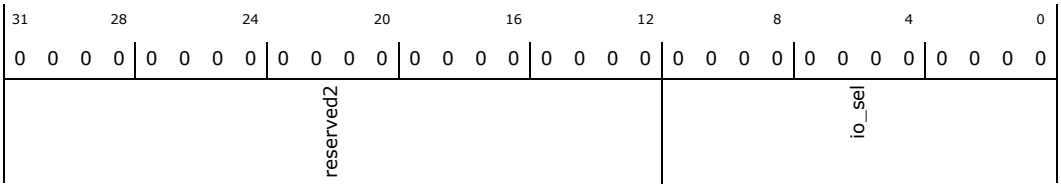
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE + 80h] + 24h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (reserved2):** Reserved.
11:0	0h RW	**Io Select (io_sel):** bit 11 - USB_ULPI_0_REFCLK bit 10 - USB_ULPI_0_STP bit 9 - USB_ULPI_0_NXT bit 8 - USB_ULPI_0_DIR bit 7 - USB_ULPI_0_DATA7 bit 6 - USB_ULPI_0_DATA6 bit 5 - USB_ULPI_0_DATA5 bit 4 - USB_ULPI_0_DATA4 bit 3 - USB_ULPI_0_DATA3 bit 2 - USB_ULPI_0_DATA2 bit 1 - USB_ULPI_0_DATA1 bit 0 - USB_ULPI_0_DATA0

39.9.10 Sus Gpio Level 2 (cfio_ioreg_SUS_GP_LVL_43_32_)—Offset 28h

This registers are implemented as dual read/write with dedicated storage for write. Write value will be stored in the write register, while read is coming from the pad directly. If GPIO(n) is programmed to be an output (via the corresponding bit in the GP_IO_SEL register), then the corresponding GP_LVL(n) write register value will drive a high or low value on the output pin. 1 = high, 0 = low. - Only the 8 lsb are used in VLV

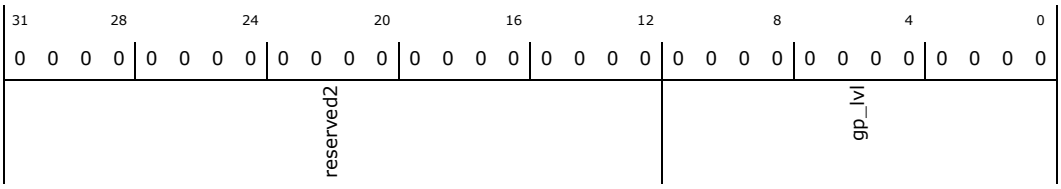
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE + 80h] + 28h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (reserved2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11:0	0h RW	**Gpio Level (gp_lvl):** bit 11 - USB_ULPI_0_REFCLK bit 10 - USB_ULPI_0_STP bit 9 - USB_ULPI_0_NXT bit 8 - USB_ULPI_0_DIR bit 7 - USB_ULPI_0_DATA7 bit 6 - USB_ULPI_0_DATA6 bit 5 - USB_ULPI_0_DATA5 bit 4 - USB_ULPI_0_DATA4 bit 3 - USB_ULPI_0_DATA3 bit 2 - USB_ULPI_0_DATA2 bit 1 - USB_ULPI_0_DATA1 bit 0 - USB_ULPI_0_DATA0

39.9.11 Sus Trigger Positive Edge Enable 2 (cfio_ioreg_SUS_TPE_43_32_)—Offset 2Ch

Access via PCU Proxy, the register trigger Positive Edge Enable: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO_USE_SEL register) will case an GPE or SMI when a 0 to 1 transition occurs. When set to 0, the GPIO signal is not enabled to trigger an GPE or SMI on a 0 to 1 transition. - Only the 8 lsb are used in VLV

Access Method

Type: I/O Register (Size: 32 bits)

39.9.12 Sus Trigger Negative Edge Enable 2 (cfio_ioreg_SUS_TNE_43_32_)—Offset 30h

Access via PCU Proxy, the register trigger Negative Edge Enable: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO_USE_SEL register) will case an GPE or SMI when a 1 to 0 transition occurs. When set to 0, the GPIO signal is not enabled to trigger an GPE or SMI on a 1 to 0 transition. - Only the 8 lsb are used in VLV

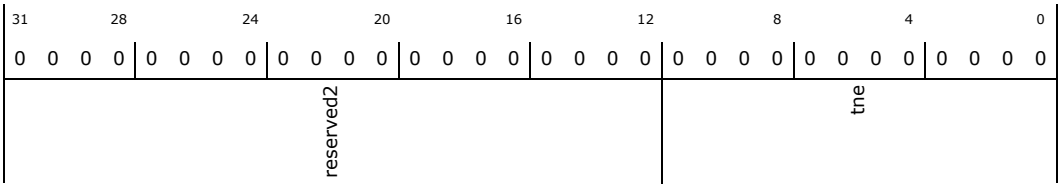
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE + 80h] + 30h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (reserved2):** Reserved.
11:0	0h RW	**Tne (tne):** bit 11 - USB_ULPI_0_REFCLK bit 10 - USB_ULPI_0_STP bit 9 - USB_ULPI_0_NXT bit 8 - USB_ULPI_0_DIR bit 7 - USB_ULPI_0_DATA7 bit 6 - USB_ULPI_0_DATA6 bit 5 - USB_ULPI_0_DATA5 bit 4 - USB_ULPI_0_DATA4 bit 3 - USB_ULPI_0_DATA3 bit 2 - USB_ULPI_0_DATA2 bit 1 - USB_ULPI_0_DATA1 bit 0 - USB_ULPI_0_DATA0

39.9.13 Sus Trigger Status (cfio_ioreg_SUS_TS_43_32_)—Offset 34h

Access via PCU Proxy, When set to a 1, the corresponding GPIO (if enabled in the GPIO_USE_SEL register) if enabled as input via IO_SEL(n), triggered an GPE or SMI. This will be set if a 0 to 1 transition occurred and TPE(n) was set, or a 1 to 0 transition occurred and TNE(n) was set. If both TPE(n) and TNE(n) are set, then this bit will be set on both a 0 to 1 and a 1 to 0 transition. This bit will not be set if the GPIO is configured as an output. - Only the 8 lsb are used in VLV

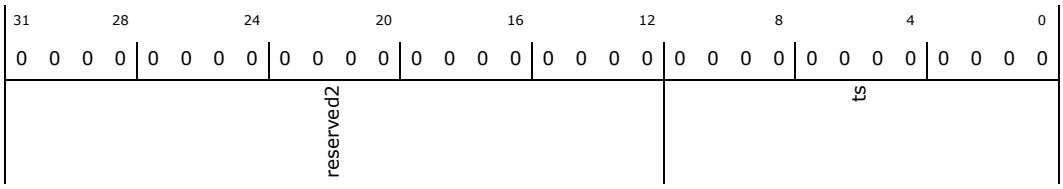
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE + 80h] + 34h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (reserved2):** Reserved.
11:0	0h WOC	**Ts (ts):** bit 11 - USB_ULPI_0_REFCLK bit 10 - USB_ULPI_0_STP bit 9 - USB_ULPI_0_NXT bit 8 - USB_ULPI_0_DIR bit 7 - USB_ULPI_0_DATA7 bit 6 - USB_ULPI_0_DATA6 bit 5 - USB_ULPI_0_DATA5 bit 4 - USB_ULPI_0_DATA4 bit 3 - USB_ULPI_0_DATA3 bit 2 - USB_ULPI_0_DATA2 bit 1 - USB_ULPI_0_DATA1 bit 0 - USB_ULPI_0_DATA0

39.9.14 Sus Wake Enable 2 (cfio_ioreg_SUS_WAKE_EN_43_32_)—Offset 38h

Access via PCU Proxy, When set to a 1 and TS(n) is set, wake event should be initiated. - Only the 8 lsb are used in VLV

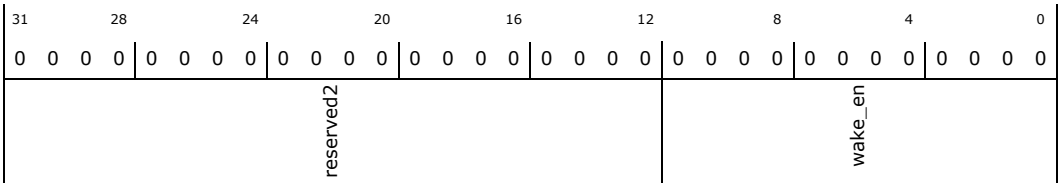
Access Method

Type: I/O Register (Size: 32 bits)

Offset: [GBASE + 80h] + 38h

GBASE Type: PCI Configuration Register (Size: 32 bits)
GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (reserved2):** Reserved.
11:0	0h RW	**Wake Enable (wake_en):** bit 11 - USB_ULPI_0_REFCLK bit 10 - USB_ULPI_0_STP bit 9 - USB_ULPI_0_NXT bit 8 - USB_ULPI_0_DIR bit 7 - USB_ULPI_0_DATA7 bit 6 - USB_ULPI_0_DATA6 bit 5 - USB_ULPI_0_DATA5 bit 4 - USB_ULPI_0_DATA4 bit 3 - USB_ULPI_0_DATA3 bit 2 - USB_ULPI_0_DATA2 bit 1 - USB_ULPI_0_DATA1 bit 0 - USB_ULPI_0_DATA0

39.10.1 Usb Oc1 B Pad Configuration (cfio_regs_pad_usb_oc1_b_PCONF0)—Offset 0h

PADs Memory space configuration register

Access Method

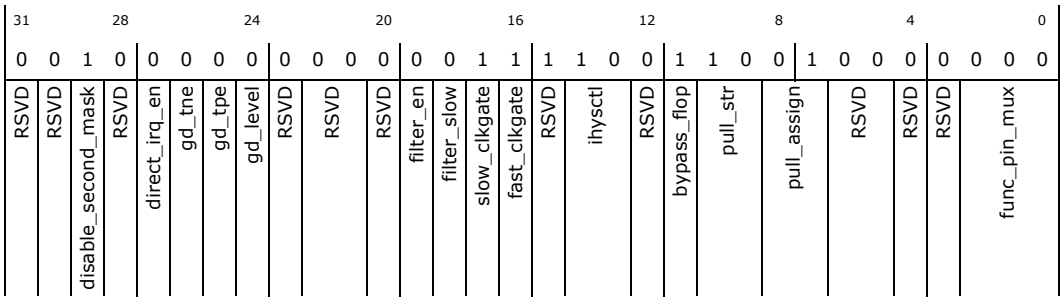
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE + 0x2000] + 0h

IOBASE + 0x2000 Type: PCI Configuration Register (Size: 32 bits)

IOBASE + 0x2000 Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003CC80h



Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	**Reserved (RSVD):** Reserved.
30	0b RO	**Reserved (RSVD):** Reserved.
29	1b RW	**Disable Second Mask (disable_second_mask):** Reserved as one
28	0b RO	**Reserved (RSVD):** Reserved.
27	0b RW	**Direct Irq En (direct_irq_en):** If this bit is set, interrupt will use direct wire and not shared. This bit should be cleared if io access mode is selected for this pad

Bit Range	Default & Access	Field Name (ID): Description
26	0b RW	**Gd Tne (gd_tne):** Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect falling edge. For level interrupt mode it will enable active low level irq
25	0b RW	**Gd Tpe (gd_tpe):** Positive edge detect for general detect event. 0 - No rising edge detect. 1 - Detect rising edge. For level interrupt mode it will enable active high level irq
24	0b RW	**Gd Level (gd_level):** When this bit is set a level irq will be choose and not edge irq
23	0b RO	**Reserved (RSVD):** Reserved.
22:21	0h RO	**Reserved (RSVD):** Reserved.
20	0b RO	**Reserved (RSVD):** Reserved.
19	0b RW	**Filter En (filter_en):** Enabling the glitch filter.
18	0b RW	**Filter Slow (filter_slow):** Switchg to slow mode glitch filter, using 32KHz clock with 62.5us glitch window filter.
17	1b RW	**Slow Clkgate (slow_clkgate):** Reserved as 1
16	1b RW	**Fast Clkgate (fast_clkgate):** Reserved as 1
15	1b RO	**Reserved (RSVD):** Reserved.
14:13	10b RW	**Ihysctl (ihysctl):** Hysteresis control. 00: min vil(V) - 0.61254 max vih(V) - 1.19637 min vil(%) - 36.9 max vih(%) - 63.9 min hysteresis(V) - 0.25232 01: min vil(V) - 0.6391 max vih(V) - 1.19637 min vil(%) - 38.5 max vih(%) - 63.9 min hysteresis(V) - 0.21912 10: min vil(V) - 0.61254 max vih(V) - 1.16991 min vil(%) - 36.9 max vih(%) - 62.3 min hysteresis(V) - 0.22244 11: min vil(V) - 0.6391 max vih(V) - 1.16991 min vil(%) - 38.5 max vih(%) - 62.3 min hysteresis(V) - 0.18924

Bit Range	Default & Access	Field Name (ID): Description
12	0b RO	**Reserved (RSVD):** Reserved.
11	1b RO	**Bypass Flop (bypass_flop):** Reserved as 1
10:9	10b RW	**Pull Str (pull_str):** Pull strength: 00 - 2K 01 - reserved 10 - 20K 11 - reserved
8:7	01b RW	**Pull Assign (pull_assign):** Pull assignment is only applicable when pad is in input mode. 00 - Non pull 01 - Pull up 10 - Pull down 11 - reserved
6:5	00b RO	**Reserved (RSVD):** Reserved.
4	0b RO	**Reserved (RSVD):** Reserved.
3	0b RO	**Reserved (RSVD):** Reserved.
2:0	000b RW	**Func Pin Mux (func_pin_mux):** Func_Pin_Mux: Functional Pin Muxing Default function is always 0. These 3 bits are setting the memory function. function 0 is USB_OC1_B function 1 is GPIOS_20

39.10.2 Usb Oc1 B Pad Value (cfio_regs_pad_usb_oc1_b_PAD_VAL)—Offset 8h

PADs Memory space Value register

Access Method

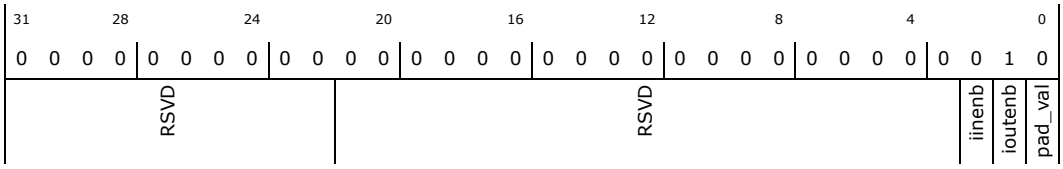
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE + 0x2000] + 8h

IOBASE + 0x2000 Type: PCI Configuration Register (Size: 32 bits)

IOBASE + 0x2000 Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved.
21:3	0h RO	**Reserved (RSVD):** Reserved.
2	0b RW	**Iinenb (iinenb):** input disable. 0 - input enabled 1 - input disabled. This bit must be cleared if output readback is required
1	1b RW	**Ioutenb (ioutenb):** output disable. 0 - output enabled 1 - output disabled.
0	0b RW	**Pad Val (pad_val):** Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.10.3 Pmu Wake B Pad Configuration (cfio_regs_pad_pmu_wake_b_PCONF0)—Offset 10h

PADs Memory space configuration register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [IOBASE + 0x2000] + 10h

40 PCU – iLB – Interrupt Decoding and Routing

The interrupt decoder is responsible for receiving interrupt messages from other devices in the SoC and decoding them for consumption by the interrupt router, the PCU – iLB – 8259 Programmable Interrupt Controllers (PIC) and/or the PCU – iLB – IO APIC.

The interrupt router is responsible for mapping each incoming interrupt to the appropriate PIRQx, for consumption by the PCU – iLB – 8259 Programmable Interrupt Controllers (PIC) and/or PCU – iLB – IO APIC.

40.1 Features

40.1.1 Interrupt Decoder

The interrupt decoder receives interrupt messages from devices in the SoC. These interrupts can be split into two primary groups:

- For consumption by the interrupt router
- For consumption by the 8259 PIC

40.1.1.1 For Consumption by the Interrupt Router

When a PCI-mapped device in the SoC asserts or de-asserts an INT[A:D] interrupt, an interrupt message is sent to the decoder. This message is decoded to indicate to the interrupt router which specific interrupt is asserted or de-asserted and which device the INT[A:D] interrupt originated from.

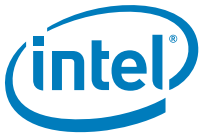
40.1.1.2 For Consumption by the 8259 PIC

When a device in the SoC asserts or de-asserts a legacy interrupt (IRQ), an interrupt message is sent to the decoder. This message is decoded to indicate to the 8259 PIC, which specific interrupt (IRQ[3, 14 or 15]) was asserted or de-asserted.

40.1.2 Interrupt Router

The interrupt router aggregates the INT[A:D] interrupts for each PCI-mapped device in the SoC, received from the interrupt decoder, and the INT[A:D] interrupts direct from the Serialized IRQ controller. It then maps these aggregated interrupts to 8 PCI based interrupts: PIRQ[A:H]. This mapping is configured using the IR[31:0] registers.

PCI based interrupts PIRQ[A:H] are then available for consumption by either the 8259 PICs or the IO-APIC, depending on the configuration of the 8 PIRQx Routing Control Registers: PIRQA, PIQRB, PIRQC, PIRQD, PIRQE, PIRQF, PIRQG, PIRQH.



40.1.2.1 Routing PCI Based Interrupts to 8259 PIC

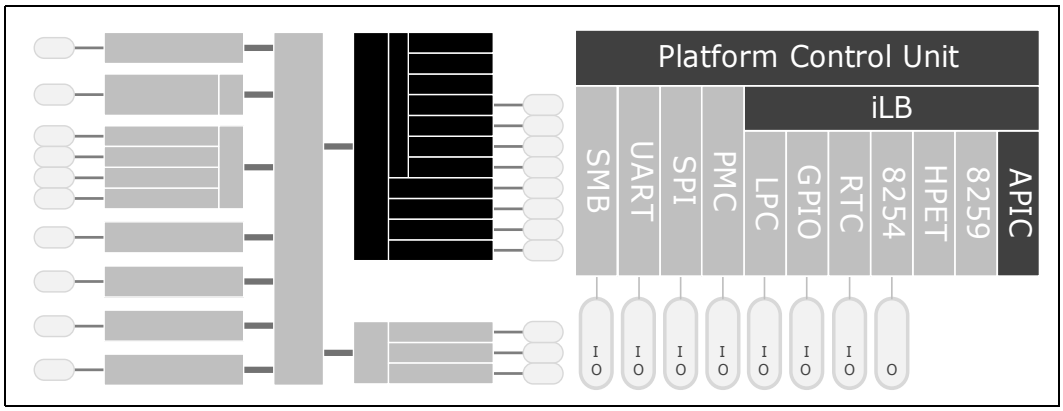
The interrupt router can be programmed to allow PIRQA-PIRQH to be routed internally to the 8259 as ISA compatible interrupts IRQ 3–7, 9–12 & 14–15. The assignment is programmable through the 8 PIRQx Routing Control Registers: PIRQA, PIQRB, PIRQC, PIRQD, PIRQE, PIRQF, PIRQG, PIRQH. One or more PIRQs can be routed to the same IRQ input. If ISA Compatible Interrupts are not required, the Route registers can be programmed to disable steering.

The PIRQx# lines are defined as active low, level sensitive. When a PIRQx# is routed to specified IRQ line, software must change the IRQ's corresponding ELCR bit to level sensitive mode. The SoC internally inverts the PIRQx# line to send an active high level to the PIC. When a PCI interrupt is routed onto the PIC, the selected IRQ can no longer be used by an active high device (through SERIRQ). However, active low interrupts can share their interrupt with PCI interrupts.

§

41 PCU – iLB – IO APIC

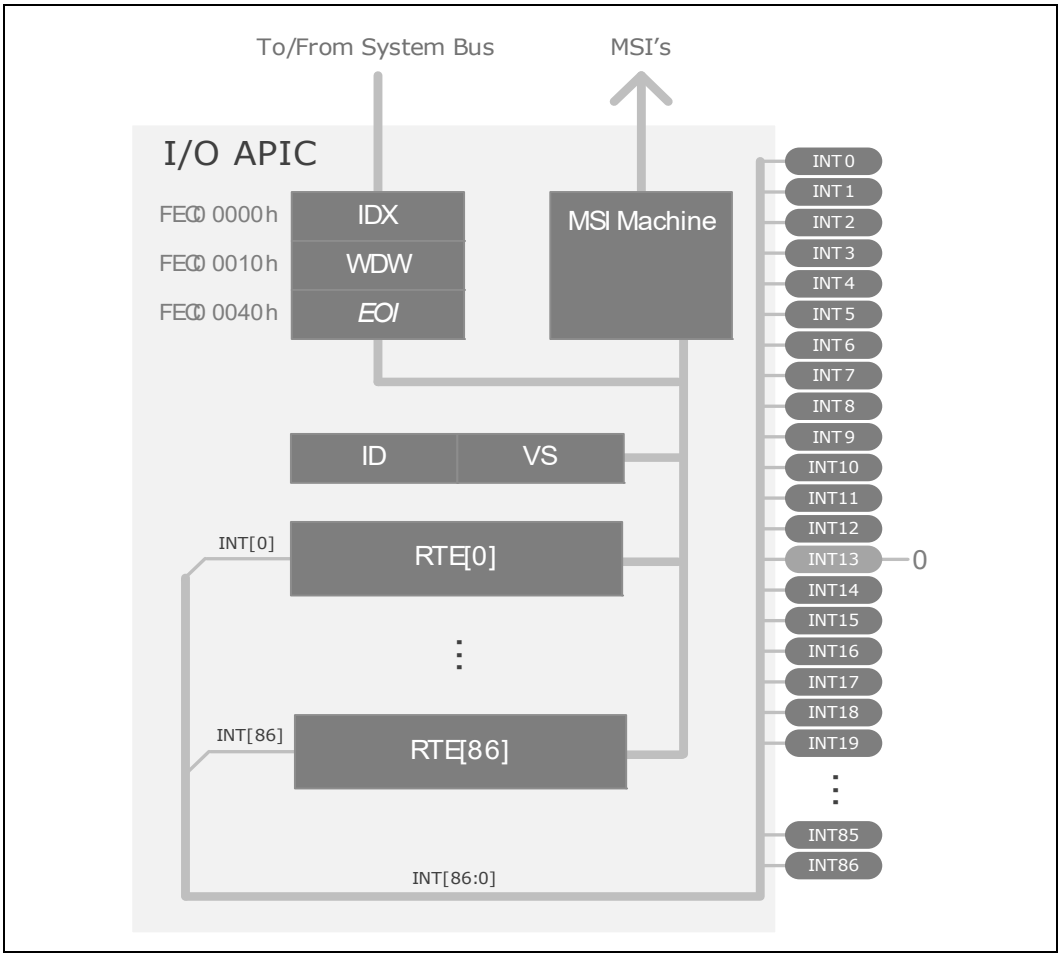
The IO Advanced Programmable Interrupt Controller (APIC) is used to support line interrupts more flexibly than the 8259 PIC. Line interrupts are routed to it from multiple sources, including legacy devices, via the interrupt decoder and serial IRQs, or they are routed to it from the interrupt router in the iLB. These line based interrupts are then used to generate interrupt messages targeting the local APIC in the processor.



41.1 Features

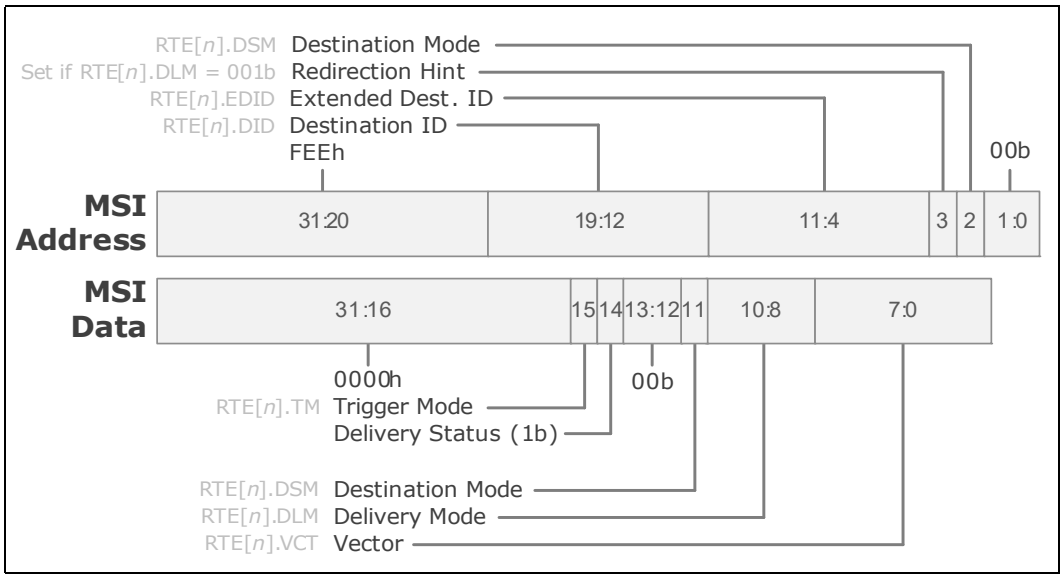
- 87 interrupt lines
  - — IRQ0-86
- Edge or level trigger mode per interrupt
- Active low or high polarity per interrupt
- Works with local APIC in processor via MSIs
- MSIs can target specific processor core
- Established APIC programming model

Figure 138.Detailed Block Diagram



MSIs generated by the I/O APIC are sent as 32-bit memory writes to the Local APIC. The address and data of the write transaction are used as follows.

Figure 139.MSI Address and Data



Destination ID (DID) and Extended Destination ID (EDID) are used to target a specific processor core's local APIC.

41.2 Use

The I/O APIC contains indirectly accessed I/O APIC registers and normal memory mapped registers. There are three memory mapped registers:

- Index Register (IDX)
- Window Register (WDW)
- End Of Interrupt Register (EOI)

The Index register selects an indirect I/O APIC register (ID/VS/RTE[*n*]) to appear in the Window register.

The Window register is used to read or write the indirect register selected by the Index register.

The EOI register is written to by the Local APIC in the processor. The I/O APIC compares the lower eight bits written to the EOI register to the Vector set for each interrupt (RTE.VCT). All interrupts that match this vector will have their RTE.RIRR register cleared. All other EOI register bits are ignored.

41.3 Indirect I/O APIC Registers

These registers are selected with the IDX register, and read/written through the WDW register. Accessing these registers must be done as DW requests, otherwise unspecified behavior will result. Software should not attempt to write to reserved registers. Reserved registers may return non-zero values when read.

Note: There is one pair of redirection (RTE) registers per interrupt line. Each pair forms a 64-bit RTE register.

Note: Specified offsets should be placed in IDX, not added to IDX.

§

41.4 PCU iLB IO APIC Memory Mapped I/O Registers

Table 343. Summary of PCU iLB I/O APIC Memory Mapped I/O Registers—

Offset	Size	Register ID—Description	Default Value
FEC00000h	1	"IDX (IOAPIC_IDX)—Offset FEC00000h" on page 5302	00h
FEC00010h	4	"WDW (IOAPIC_WDW)—Offset FEC00010h" on page 5302	00000000h
FEC00040h	4	"EOI (IOAPIC_EOI)—Offset FEC00040h" on page 5303	00000000h

41.4.1 IDX (IOAPIC_IDX)—Offset FEC00000h

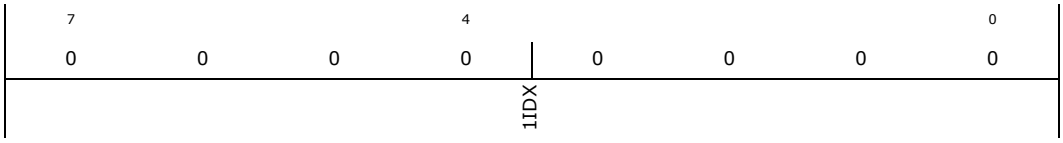
Index Register

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

IOAPIC_IDX: FEC00000h

Default: 00h



Bit Range	Default & Access	Description
7:0	0h RW	**IDX:** This 8-bit register selects which indirect register appears in the window register to be manipulated by software. Software will program this register to select the desired APIC internal register.

41.4.2 WDW (IOAPIC_WDW)—Offset FEC00010h

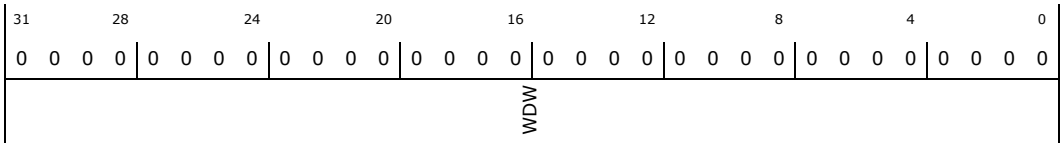
Window Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

IOAPIC_WDW: FEC00010h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**WDW:** This 32-bit register specifies the data to be read or written to the register pointed to by the IDX register. This register can be accessed only in DW quantities.

41.4.3 EOI (IOAPIC_EOI)—Offset FEC00040h

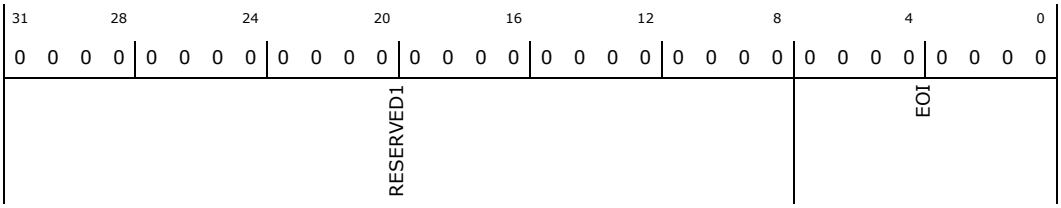
EOI Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

IOAPIC_EOI: FEC00040h

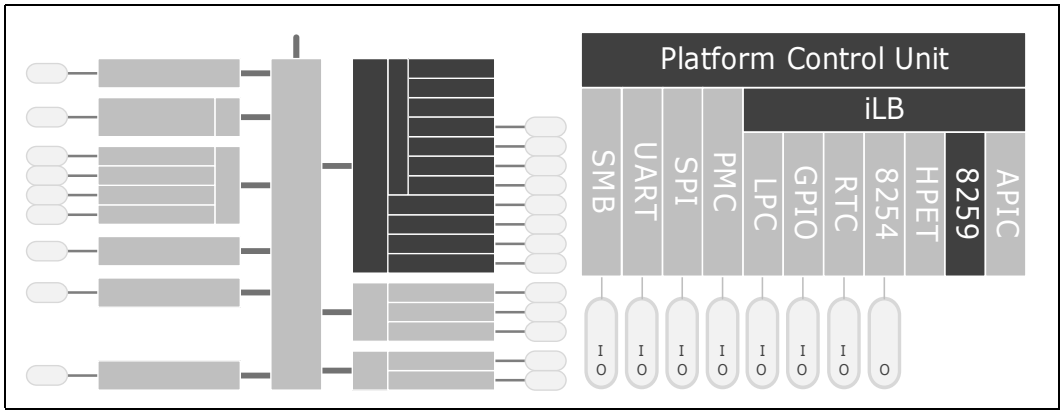
Default: 00000000h



Bit Range	Default & Access	Description
31:8	0b WO	**RESERVED (RESERVED1):** Reserved.
7:0	0h WO	**EOI:** When a write is issued to this register, the IOxAPIC will check the lower 8 bits written to this register, and compare it with the vector field for each entry in the I/O Redirection Table. When a match is found, RTE.RIRR for that entry will be cleared. If multiple entries have the same vector, each of those entries will have RTE.RIRR cleared.

42 PCU – iLB – 8259 Programmable Interrupt Controllers (PIC)

The SoC provides an ISA-compatible programmable interrupt controller (PIC) that incorporates the functionality of two, cascaded 8259 interrupt controllers.



42.1 Features

In addition to providing support for ISA compatible interrupts, this interrupt controller can also support PCI based interrupts (PIRQs) by mapping the PCI interrupt onto a compatible ISA interrupt line. Each 8259 controller supports eight interrupts, numbered 0–7. Table 344 shows how the controllers are connected.

Note: The SoC does not implement any external PIRQ# signals. The PIRQs referred to in this chapter originate from the interrupt routing unit.

Table 344. Interrupt Controller Connections

8259	8259 Input	Connected Pin / Function
Master	0	Internal Timer / Counter 0 output or HPET #0; determined by GCFG.LRE register bit
	1	IRQ1 using SERIRQ, Keyboard Emulation
	2	Slave controller INTR output
	3	IRQ3 via SERIRQ or PIRQx
	4	IRQ4 SERIRQ, PIRQx or PCU UART
	5	IRQ5 via SERIRQ or PIRQx
	6	IRQ6 via SERIRQ or PIRQx
	7	IRQ7 via SERIRQ or PIRQx
Slave	0	Inverted IRQ8# from internal RTC or HPET
	1	IRQ9 via SERIRQ, SCI or PIRQx
	2	IRQ10 via SERIRQ, SCI or PIRQx
	3	IRQ11 via SERIRQ, SCI, HPET or PIRQx
	4	IRQ12 via SERIRQ, PIRQx or mouse emulation
	5	None
	6	PIRQx or IRQ14 from SATA controller
	7	IRQ15 via SERIRQ or PIRQx or IRQ15 from SATA controller

The SoC cascades the slave controller onto the master controller through master controller interrupt input 2. This means there are only 15 possible interrupts for the SoC PIC.

Interrupts can be programmed individually to be edge or level, except for IRQ0, IRQ2 and IRQ8#.

Note: Active-low interrupt sources (such as a PIRQ#) are inverted inside the SoC. In the following descriptions of the 8259s, the interrupt levels are in reference to the signals at the internal interface of the 8259s, after the required inversions have occurred. Therefore, the term "high" indicates "active," which means "low" on an originating PIRQ#.

42.1.1 Interrupt Handling

42.1.1.1 Generating Interrupts

The PIC interrupt sequence involves three bits, from the IRR, ISR, and IMR, for each interrupt level. These bits are used to determine the interrupt vector returned, and status of any other pending interrupts. Table 345 defines the IRR, ISR, and IMR.

Table 345. Interrupt Status Registers

Bit	Description
IRR	**Interrupt Request Register.** This bit is set on a low to high transition of the interrupt line in edge mode, and by an active high level in level mode.
ISR	**Interrupt Service Register.** This bit is set, and the corresponding IRR bit cleared, when an interrupt acknowledge cycle is seen, and the vector returned is for that interrupt.
IMR	**Interrupt Mask Register.** This bit determines whether an interrupt is masked. Masked interrupts will not generate INTR.

42.1.1.2 Acknowledging Interrupts

The processor generates an interrupt acknowledge cycle that is translated into a Interrupt Acknowledge Cycle to the SoC. The PIC translates this command into two internal INTA# pulses expected by the 8259 controllers. The PIC uses the first internal INTA# pulse to freeze the state of the interrupts for priority resolution. On the second INTA# pulse, the master or slave sends the interrupt vector to the processor with the acknowledged interrupt code. This code is based upon the ICW2.IVBA bits, combined with the ICW2.IRL bits representing the interrupt within that controller.

Note: References to ICWx and OCWx registers are relevant to both the master and slave 8259 controllers.

Table 346. Content of Interrupt Vector Byte

Master, Slave Interrupt	Bits [7:3]	Bits [2:0]
IRQ7,15	ICW2.IVBA	111
IRQ6,14		110
IRQ5,13		101
IRQ4,12		100
IRQ3,11		011
IRQ2,10		010
IRQ1,9		001
IRQ0,8		000

42.1.1.3 Hardware/Software Interrupt Sequence

1. One or more of the Interrupt Request lines (IRQ) are raised high in edge mode, or seen high in level mode, setting the corresponding IRR bit.
2. The PIC sends INTR active to the processor if an asserted interrupt is not masked.
3. The processor acknowledges the INTR and responds with an interrupt acknowledge cycle.

4. Upon observing the special cycle, the SoC converts it into the two cycles that the internal 8259 pair can respond to. Each cycle appears as an interrupt acknowledge pulse on the internal INTA# pin of the cascaded interrupt controllers.
5. Upon receiving the first internally generated INTA# pulse, the highest priority ISR bit is set and the corresponding IRR bit is reset. On the trailing edge of the first pulse, a slave identification code is broadcast by the master to the slave on a private, internal three bit wide bus. The slave controller uses these bits to determine if it must respond with an interrupt vector during the second INTA# pulse.
6. Upon receiving the second internally generated INTA# pulse, the PIC returns the interrupt vector. If no interrupt request is present because the request was too short in duration, the PIC returns vector 7 from the master controller.
7. This completes the interrupt cycle. In AEOI mode the ISR bit is reset at the end of the second INTA# pulse. Otherwise, the ISR bit remains set until an appropriate EOI command is issued at the end of the interrupt subroutine.

42.1.2 Initialization Command Words (ICWx)

Before operation can begin, each 8259 must be initialized. In the SoC, this is a four byte sequence. The four initialization command words are referred to by their acronyms: ICW1, ICW2, ICW3, and ICW4.

The base address for each 8259 initialization command word is a fixed location in the I/O memory space: 20h for the master controller, and A0h for the slave controller.

42.1.2.1 ICW1

A write to the master or slave controller base address with data bit 4 equal to 1 is interpreted as a write to ICW1. Upon sensing this write, the PIC expects three more byte writes to 21h for the master controller, or A1h for the slave controller, to complete the ICW sequence.

A write to ICW1 starts the initialization sequence during which the following automatically occur:

1. Following initialization, an interrupt request (IRQ) input must make a low-to-high transition to generate an interrupt.
2. The Interrupt Mask Register is cleared.
3. IRQ7 input is assigned priority 7.
4. The slave mode address is set to 7.
5. Special mask mode is cleared and Status Read is set to IRR.

42.1.2.2 ICW2

The second write in the sequence (ICW2) is programmed to provide bits [7:3] of the interrupt vector that will be released during an interrupt acknowledge. A different base is selected for each interrupt controller.

42.1.2.3 ICW3

The third write in the sequence (ICW3) has a different meaning for each controller.

- For the master controller, ICW3 is used to indicate which IRQ input line is used to cascade the slave controller. Within the SoC, IRQ2 is used. Therefore, MICW3.CCC is set to a 1, and the other bits are set to 0s.
- For the slave controller, ICW3 is the slave identification code used during an interrupt acknowledge cycle. On interrupt acknowledge cycles, the master controller broadcasts a code to the slave controller if the cascaded interrupt won arbitration on the master controller. The slave controller compares this identification code to the value stored in its ICW3, and if it matches, the slave controller assumes responsibility for broadcasting the interrupt vector.

42.1.2.4 ICW4

The final write in the sequence (ICW4) must be programmed for both controllers. At the very least, ICW4.MM must be set to a 1 to indicate that the controllers are operating in an Intel Architecture-based system.

42.1.3 Operation Command Words (OCW)

These command words reprogram the Interrupt controller to operate in various interrupt modes.

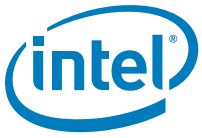
- OCW1 masks and unmasks interrupt lines.
- OCW2 controls the rotation of interrupt priorities when in rotating priority mode, and controls the EOI function.
- OCW3 sets up ISR/IRR reads, enables/disables the special mask mode (SMM), and enables/disables polled interrupt mode.

42.1.4 Modes of Operation

42.1.4.1 Fully Nested Mode

In this mode, interrupt requests are ordered in priority from 0 through 7, with 0 being the highest. When an interrupt is acknowledged, the highest priority request is determined and its vector placed on the bus. Additionally, the ISR for the interrupt is set. This ISR bit remains set until: the processor issues an EOI command immediately before returning from the service routine; or if in AEOI mode, on the trailing edge of the second INTA#. While the ISR bit is set, all further interrupts of the same or lower priority are inhibited, while higher levels generate another interrupt.

Interrupt priorities can be changed in the rotating priority mode.



42.1.4.2 Special Fully-Nested Mode

This mode is used in the case of a system where cascading is used, and the priority has to be conserved within each slave. In this case, the special fully-nested mode is programmed to the master controller. This mode is similar to the fully-nested mode with the following exceptions:

- When an interrupt request from a certain slave is in service, this slave is not locked out from the master's priority logic and further interrupt requests from higher priority interrupts within the slave are recognized by the master and initiate interrupts to the processor. In the normal-nested mode, a slave is masked out when its request is in service.
- When exiting the Interrupt Service routine, software has to check whether the interrupt serviced was the only one from that slave. This is done by sending a Non-Specific EOI command to the slave and then reading its ISR. If it is 0, a non-specific EOI can also be sent to the master.

42.1.4.3 Automatic Rotation Mode (Equal Priority Devices)

In some applications, there are a number of interrupting devices of equal priority. Automatic rotation mode provides for a sequential 8-way rotation. In this mode, a device receives the lowest priority after being serviced. In the worst case, a device requesting an interrupt has to wait until each of seven other devices are serviced at most once.

There are two ways to accomplish automatic rotation using OCW2.REOI; the Rotation on Non-Specific EOI Command (OCW2.REOI=101b) and the rotate in automatic EOI mode which is set by (OCW2.REOI=100b).

42.1.4.4 Specific Rotation Mode (Specific Priority)

Software can change interrupt priorities by programming the bottom priority. For example, if IRQ5 is programmed as the bottom priority device, then IRQ6 is the highest priority device. The Set Priority Command is issued in OCW2 to accomplish this, where: OCW2.REOI=11xb, and OCW2.ILS is the binary priority level code of the bottom priority device.

In this mode, internal status is updated by software control during OCW2. However, it is independent of the EOI command. Priority changes can be executed during an EOI command by using the Rotate on Specific EOI Command in OCW2 (OCW2.REOI=111b) and OCW2.ILS=IRQ level to receive bottom priority.

42.1.4.5 Poll Mode

Poll mode can be used to conserve space in the interrupt vector table. Multiple interrupts that can be serviced by one interrupt service routine do not need separate vectors if the service routine uses the poll command. Poll mode can also be used to expand the number of interrupts. The polling interrupt service routine can call the appropriate service routine, instead of providing the interrupt vectors in the vector

table. In this mode, the INTR output is not used and the microprocessor internal Interrupt Enable flip-flop is reset, disabling its interrupt input. Service to devices is achieved by software using a Poll command.

The Poll command is issued by setting OCW3.PMC. The PIC treats its next I/O read as an interrupt acknowledge, sets the appropriate ISR bit if there is a request, and reads the priority level. Interrupts are frozen from the OCW3 write to the I/O read. The byte returned during the I/O read contains a 1 in Bit 7 if there is an interrupt, and the binary code of the highest priority level in Bits 2:0.

42.1.4.6 Edge and Level Triggered Mode

In ISA systems this mode is programmed using ICW1.LTIM, which sets level or edge for the entire controller. In the SoC, this bit is disabled and a register for edge and level triggered mode selection, per interrupt input, is included. This is the Edge/Level control Registers ELCR1 and ELCR2.

If an ELCR bit is 0, an interrupt request will be recognized by a low-to-high transition on the corresponding IRQ input. The IRQ input can remain high without generating another interrupt. If an ELCR bit is 1, an interrupt request will be recognized by a high level on the corresponding IRQ input and there is no need for an edge detection. The interrupt request must be removed before the EOI command is issued to prevent a second interrupt from occurring.

In both the edge and level triggered modes, the IRQ inputs must remain active until after the falling edge of the first internal INTA#. If the IRQ input goes inactive before this time, a default IRQ7 vector is returned.

42.1.5 End of Interrupt (EOI) Operations

An EOI can occur in one of two fashions: by a command word write issued to the PIC before returning from a service routine, the EOI command; or automatically when the ICW4.AEOI bit is set to 1.

42.1.5.1 Normal End of Interrupt

In normal EOI, software writes an EOI command before leaving the interrupt service routine to mark the interrupt as completed. There are two forms of EOI commands: Specific and Non-Specific. When a Non-Specific EOI command is issued, the PIC clears the highest ISR bit of those that are set to 1. Non-Specific EOI is the normal mode of operation of the PIC within the SoC, as the interrupt being serviced currently is the interrupt entered with the interrupt acknowledge. When the PIC is operated in modes that preserve the fully nested structure, software can determine which ISR bit to clear by issuing a Specific EOI.

An ISR bit that is masked is not cleared by a Non-Specific EOI if the PIC is in the special mask mode. An EOI command must be issued for both the master and slave controller.

42.1.5.2 Automatic End of Interrupt Mode

In this mode, the PIC automatically performs a Non-Specific EOI operation at the trailing edge of the last interrupt acknowledge pulse. From a system standpoint, this mode should be used only when a nested multi-level interrupt structure is not required within a single PIC. The AEOI mode can only be used in the master controller and not the slave controller.

Note: Both the master and slave PICs have an AEOI bit: MICW4.AEOI and SICW4.AEOI respectively. Only the MICW4.AEOI bit should be set by software. The SICW4.AEOI bit should not be set by software.

42.1.6 Masking Interrupts

42.1.6.1 Masking on an Individual Interrupt Request

Each interrupt request can be masked individually by the Interrupt Mask Register (IMR). This register is programmed through OCW1. Each bit in the IMR masks one interrupt channel. Masking IRQ2 on the master controller masks all requests for service from the slave controller.

42.1.6.2 Special Mask Mode

Some applications may require an interrupt service routine to dynamically alter the system priority structure during its execution under software control. For example, the routine may wish to inhibit lower priority requests for a portion of its execution but enable some of them for another portion.

The special mask mode enables all interrupts not masked by a bit set in the Mask register. Normally, when an interrupt service routine acknowledges an interrupt without issuing an EOI to clear the ISR bit, the interrupt controller inhibits all lower priority requests. In the special mask mode, any interrupts may be selectively enabled by loading the Mask Register with the appropriate pattern.

The special mask mode is set by OCW3.ESMM=1b & OCW3.SMM=1b, and cleared where OCW3.ESMM=1b & OCW3.SMM=0b.

42.2 IO Mapped Registers

The interrupt controller registers are located at 20h and 21h for the master controller (IRQ0 - 7), and at A0h and A1h for the slave controller (IRQ8 - 13). These registers have multiple functions, depending upon the data written to them. Table 347 is a description of the different register possibilities for each address.

Note: The register descriptions after Table 347 represent one register possibility.

42.3.1 MICW1—Offset 20h

Master Initialization Command Word 1.A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs: * The Interrupt Mask register is cleared. * IRQ7 input is assigned priority 7. * The slave mode address is set to 7. * Special Mask Mode is cleared and Status Read is set to IRR. Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Access Method

Type: I/O Register
(Size: 8 bits)

MICW1: 20h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
MCS85			ICWOCWSEL	LTIM	ADI	SNGL	IC4

Bit Range	Default & Access	Description
7:5	X WO	**MCS85:** These bits are MCS-85 specific, and not needed. Should be programmed to 000

Bit Range	Default & Access	Description
4	X WO	**ICWOCWSEL:** ICW/OCW select: This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence.
3	X WO	**LTIM:** Edge/Level Bank Select (LTIM): Disabled. Replaced by ELCR1 and ELCR2.
2	X WO	**ADI:** ADI. Ignored for VLV. Should be programmed to 0.
1	X WO	**SNGL:** Single or Cascade (SNGL): Must be programmed to a 0 to indicate two controllers operating in cascade mode.
0	X WO	**IC4:** wICW4 Write Required (IC4): This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed.

42.3.2 MICW2—Offset 21h

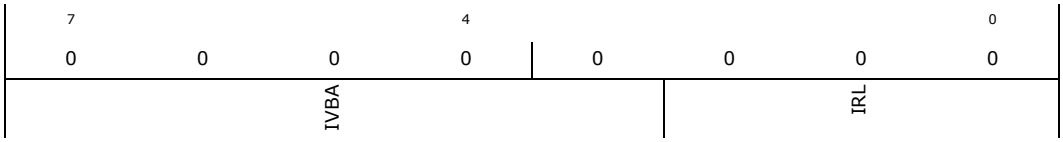
Master ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

Access Method

Type: I/O Register
(Size: 8 bits)

MICW2: 21h

Default: 00h



Bit Range	Default & Access	Description
7:3	X WO	**IVBA:** Interrupt Vector Base Address: Bits [7:3] define the base address in the interrupt vector table for the interrupt routines associated with each interrupt request level input.
2:0	X WO	**IRL:** Interrupt Request Level: When writing ICW2, these bits should all be 0. During an interrupt acknowledge cycle, these bits are programmed by the interrupt controller with the interrupt to be serviced. This is combined with bits [7:3] to form the interrupt vector driven onto the data bus during the second INTA# cycle. The code is a three bit binary code: Code Master Interrupt Slave Interrupt 000 IRQ0 IRQ8 001 IRQ1 IRQ9 010 IRQ2 IRQ10 011 IRQ3 IRQ11 100 IRQ4 IRQ12 101 IRQ5 IRQ13 110 IRQ6 IRQ14 111 IRQ7 IRQ15

42.3.3 MOCW2—Offset 24h

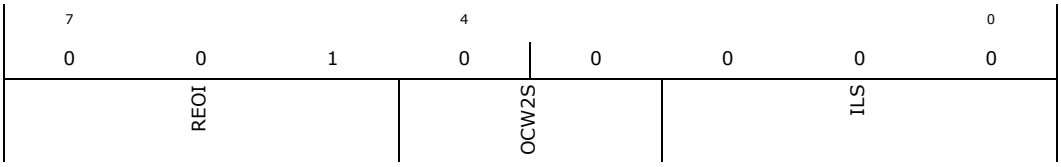
Master Operational Control Word 2 (Interrupt Mask).Following a part reset or ICW initialization, the controller enters the fully nested mode of operation. Non-specific EOI without rotation is the default. Both rotation mode and specific EOI mode are disabled following initialization.

Access Method

Type: I/O Register
(Size: 8 bits)

MOCW2: 24h

Default: 20h



Bit Range	Default & Access	Description
7:5	001b WO	**REOI:** Rotate and EOI Codes: R, SL, EOI - These three bits control the Rotate and End of Interrupt modes and combinations of the two. A chart of these combinations is listed above under the bit definition. 000 - Rotate in Auto EOI Mode (Clear) 001 - Non-specific EOI command 010 - No Operation 011 - *Specific EOI Command 100 - Rotate in Auto EOI Mode (Set) 101 - Rotate on Non-Specific EOI Command 110 - *Set Priority Command 111 - *Rotate on Specific EOI Command *L0 - L2 Are Used
4:3	X WO	**OCW2S:** OCW2 Select: When selecting OCW2, bits 4:3 = 00
2:0	X WO	**ILS:** Interrupt Level Select (L2, L1, L0): L2, L1, and L0 determine the interrupt level acted upon when the SL bit is active. A simple binary code, outlined above, selects the channel for the command to act upon. When the SL bit is inactive, these bits do not have a defined function; programming L2, L1 and L0 to 0 is sufficient in this case. Bits Interrupt Level Bits Interrupt Level 000 IRQ0/8 100 IRQ4/12 001 IRQ1/9 101 IRQ5/13 010 IRQ2/10 110 IRQ6/14 011 IRQ3/11 111 IRQ7/15

42.3.4 MICW3—Offset 25h

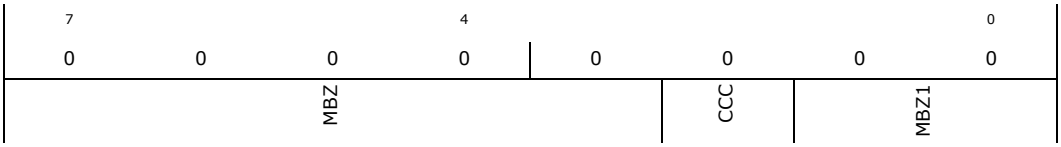
Master Initialization Command Word 3

Access Method

Type: I/O Register
(Size: 8 bits)

MICW3: 25h

Default: 00h



Bit Range	Default & Access	Description
7:3	X WO	**MBZ:** These bits must be programmed to zero.
2	X WO	**CCC:** Cascaded Controller Connection (CCC): This bit must always be programmed to a 1 to indicate the slave controller for interrupts 8 15 is cascaded on IRQ2.
1:0	X WO	**MBZ (MBZ1):** These bits must be programmed to zero.

42.3.5 MOCW3—Offset 28h

Master Operational Control Word 3

Access Method

Type: I/O Register
(Size: 8 bits)

MOCW3: 28h

Default: 22h

7			4			0
0	0	1	0	0	0	1	0
RESERVED	SMM	ESMM	O3S		PMC	RRC	

Bit Range	Default & Access	Description
7	0b RO	**RESERVED:** Reserved. Must be 0.
6	0b WO	**SMM:** Special Mask Mode (SMM): If this bit is set, the Special Mask Mode can be used by an interrupt service routine to dynamically alter the system priority structure while the routine is executing, through selective enabling/ disabling of the other channel's mask bits. Bit 6, the ESMM bit, must be set for this bit to have any meaning.
5	1b WO	**ESMM:** Enable Special Mask Mode (ESMM): When set, the SMM bit is enabled to set or reset the Special Mask Mode. When cleared, the SMM bit becomes a don't care.
4:3	X WO	**O3S:** OCW3 Select (O3S): When selecting OCW3, bits 4:3 = 01
2	X WO	**PMC:** Poll Mode Command (PMC): When cleared, poll command is not issued. When set, the next I/O read to the interrupt controller is treated as an interrupt acknowledge cycle. An encoded byte is driven onto the data bus, representing the highest priority level requesting service.
1:0	10b WO	**RRC:** Register Read Command (RRC): These bits provide control for reading the ISR and Interrupt IRR. When bit 1=0, bit 0 will not affect the register read selection. Following ICW initialization, the default OCW3 port address read will be read IRR. To retain the current selection (read ISR or read IRR), always write a 0 to bit 1 when programming this register. The selected register can be read repeatedly without reprogramming OCW3. To select a new status register, OCW3 must be reprogrammed prior to attempting the read. 00 No Action 01 No Action 10 Read IRQ Register 11 Read IS Register

42.3.6 MICW4—Offset 29h

Master Initialization Command Word 4

Access Method

Type: I/O Register
(Size: 8 bits)

MICW4: 29h

Default: 01h

7			4				0
0	0	0	0	0	0	0	1
	MBZ		SFNM	BUF	MSBM	AEOI	MM

Bit Range	Default & Access	Description
7:5	X WO	**MBZ:** These bits must be programmed to zero.
4	0b WO	**SFNM:** Special Fully Nested Mode (SFNM): Should normally be disabled by writing a 0 to this bit. If SFNM=1, the special fully nested mode is programmed.

Bit Range	Default & Access	Description
3	0b WO	**BUF:** Buffered Mode (BUF): Must be cleared for non-buffered mode. Writing 1 will result in undefined behavior.
2	0b WO	**MSBM:** Master/Slave in Buffered Mode (MSBM): Not used. Should always be programmed to 0.
1	0b WO	**AEOI:** Automatic End of Interrupt (AEOI): This bit should normally be programmed to 0. This is the normal end of interrupt. If this bit is 1, the automatic end of interrupt mode is programmed.
0	1b WO	**MM:** Microprocessor Mode (MM): This bit must be written to 1 to indicate that the controller is operating in an Intel Architecture-based system. Writing 0 will result in undefined behavior.

42.3.7 MOCW1—Offset 2Dh

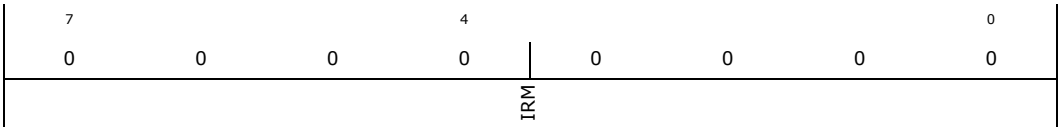
Master Operational Control Word 1 (Interrupt Mask)

Access Method

Type: I/O Register
(Size: 8 bits)

MOCW1: 2Dh

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**IRM:** Interrupt Request Mask (IRM): When a 1 is written to any bit in this register, the corresponding IRQ line is masked. When a 0 is written to any bit in this register, the corresponding IRQ mask bit is cleared, and interrupt requests will again be accepted by the controller. Masking IRQ2 on the master controller will also mask the interrupt requests from the slave controller.

42.3.8 SICW1—Offset A0h

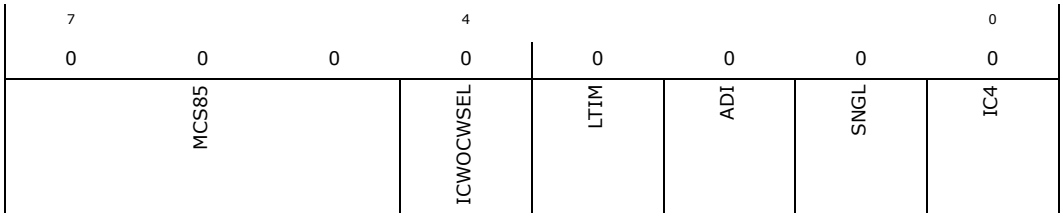
Slave Initialization Command Word 1.A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs: * The Interrupt Mask register is cleared. * IRQ7 input is assigned priority 7. * The slave mode address is set to 7. * Special Mask Mode is cleared and Status Read is set to IRR. Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Access Method

Type: I/O Register
(Size: 8 bits)

SICW1: A0h

Default: 00h



Bit Range	Default & Access	Description
7:5	X WO	**MCS85:** These bits are MCS-85 specific, and not needed. Should be programmed to 000
4	X WO	**ICWOCWSEL:** ICW/OCW select: This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence.
3	X WO	**LTIM:** Edge/Level Bank Select (LTIM): Disabled. Replaced by ELCR1 and ELCR2.
2	X WO	**ADI:** ADI. Ignored for VLV. Should be programmed to 0.
1	X WO	**SNGL:** Single or Cascade (SNGL): Must be programmed to a 0 to indicate two controllers operating in cascade mode.
0	X WO	**IC4:** wICW4 Write Required (IC4): This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed.

42.3.9 SICW2—Offset A1h

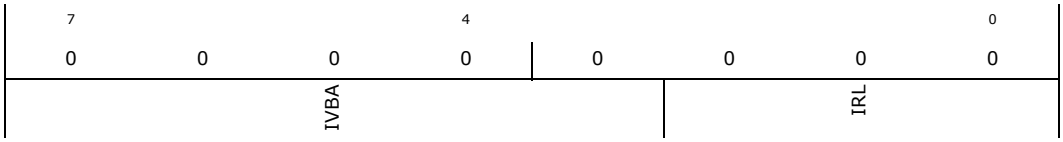
Slave ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

Access Method

Type: I/O Register (Size: 8 bits)

SICW2: A1h

Default: 00h



Bit Range	Default & Access	Description
7:3	X WO	**IVBA:** Interrupt Vector Base Address: Bits [7:3] define the base address in the interrupt vector table for the interrupt routines associated with each interrupt request level input.
2:0	X WO	**IRL:** Interrupt Request Level: When writing ICW2, these bits should all be 0. During an interrupt acknowledge cycle, these bits are programmed by the interrupt controller with the interrupt to be serviced. This is combined with bits [7:3] to form the interrupt vector driven onto the data bus during the second INTA# cycle. The code is a three bit binary code: Code Master Interrupt Slave Interrupt 000 IRQ0 IRQ8 001 IRQ1 IRQ9 010 IRQ2 IRQ10 011 IRQ3 IRQ11 100 IRQ4 IRQ12 101 IRQ5 IRQ13 110 IRQ6 IRQ14 111 IRQ7 IRQ15

42.3.10 SOCW2—Offset A4h

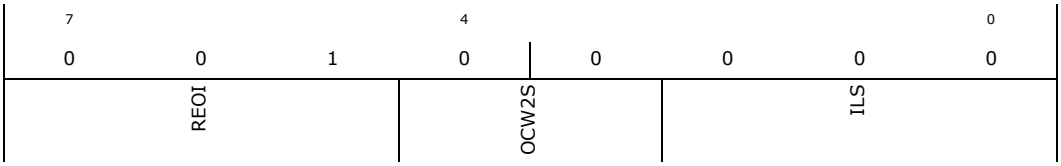
Slave Operational Control Word 2 (Interrupt Mask).Following a part reset or ICW initialization, the controller enters the fully nested mode of operation. Non-specific EOI without rotation is the default. Both rotation mode and specific EOI mode are disabled following initialization.

Access Method

Type: I/O Register
(Size: 8 bits)

SOCW2: A4h

Default: 20h



Bit Range	Default & Access	Description
7:5	001b WO	**REOI:** Rotate and EOI Codes: R, SL, EOI - These three bits control the Rotate and End of Interrupt modes and combinations of the two. A chart of these combinations is listed above under the bit definition. 000 - Rotate in Auto EOI Mode (Clear) 001 - Non-specific EOI command 010 - No Operation 011 - *Specific EOI Command 100 - Rotate in Auto EOI Mode (Set) 101 - Rotate on Non-Specific EOI Command 110 - *Set Priority Command 111 - *Rotate on Specific EOI Command *L0 - L2 Are Used
4:3	X WO	**OCW2S:** OCW2 Select: When selecting OCW2, bits 4:3 = 00
2:0	X WO	**ILS:** Interrupt Level Select (L2, L1, L0): L2, L1, and L0 determine the interrupt level acted upon when the SL bit is active. A simple binary code, outlined above, selects the channel for the command to act upon. When the SL bit is inactive, these bits do not have a defined function; programming L2, L1 and L0 to 0 is sufficient in this case. Bits Interrupt Level Bits Interrupt Level 000 IRQ0/8 100 IRQ4/12 001 IRQ1/9 101 IRQ5/13 010 IRQ2/10 110 IRQ6/14 011 IRQ3/11 111 IRQ7/15

42.3.11 SICW3—Offset A5h

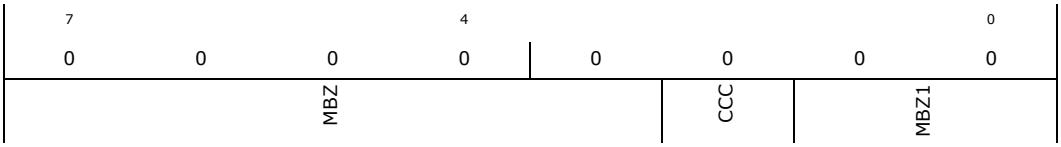
Slave Initialization Command Word 3

Access Method

Type: I/O Register
(Size: 8 bits)

SICW3: A5h

Default: 00h



Bit Range	Default & Access	Description
7:3	X WO	**MBZ:** These bits must be programmed to zero.
2	X WO	**CCC:** Cascaded Controller Connection (CCC): This bit must always be programmed to a 1 to indicate the slave controller for interrupts 8 15 is cascaded on IRQ2.

Bit Range	Default & Access	Description
1:0	X WO	**MBZ (MBZ1):** These bits must be programmed to zero.

42.3.12 SOCW3—Offset A8h

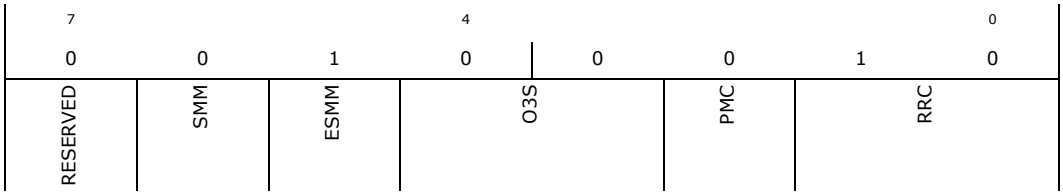
Slave Operational Control Word 3

Access Method

Type: I/O Register
(Size: 8 bits)

SOCW3: A8h

Default: 22h



Bit Range	Default & Access	Description
7	0b RO	**RESERVED:** Reserved. Must be 0.
6	0b WO	**SMM:** Special Mask Mode (SMM): If this bit is set, the Special Mask Mode can be used by an interrupt service routine to dynamically alter the system priority structure while the routine is executing, through selective enabling/ disabling of the other channel's mask bits. Bit 6, the ESMM bit, must be set for this bit to have any meaning.
5	1b WO	**ESMM:** Enable Special Mask Mode (ESMM): When set, the SMM bit is enabled to set or reset the Special Mask Mode. When cleared, the SMM bit becomes a don't care.
4:3	X WO	**O3S:** OCW3 Select (O3S): When selecting OCW3, bits 4:3 = 01
2	X WO	**PMC:** Poll Mode Command (PMC): When cleared, poll command is not issued. When set, the next I/O read to the interrupt controller is treated as an interrupt acknowledge cycle. An encoded byte is driven onto the data bus, representing the highest priority level requesting service.
1:0	10b WO	**RRC:** Register Read Command (RRC): These bits provide control for reading the ISR and Interrupt IRR. When bit 1=0, bit 0 will not affect the register read selection. Following ICW initialization, the default OCW3 port address read will be read IRR. To retain the current selection (read ISR or read IRR), always write a 0 to bit 1 when programming this register. The selected register can be read repeatedly without reprogramming OCW3. To select a new status register, OCW3 must be reprogrammed prior to attempting the read. 00 No Action 01 No Action 10 Read IRQ Register 11 Read IS Register

42.3.13 SICW4—Offset A9h

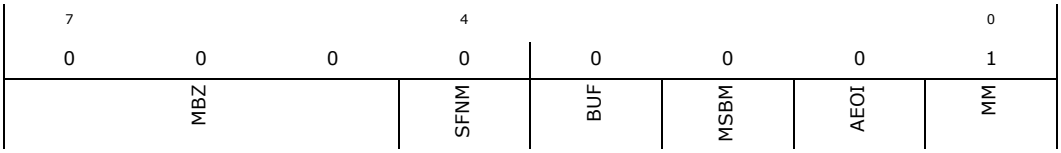
Slave Initialization Command Word 4

Access Method

Type: I/O Register
(Size: 8 bits)

SICW4: A9h

Default: 01h



Bit Range	Default & Access	Description
7:5	X WO	**MBZ:** These bits must be programmed to zero.
4	0b WO	**SFNM:** Special Fully Nested Mode (SFNM): Should normally be disabled by writing a 0 to this bit. If SFNM=1, the special fully nested mode is programmed.
3	0b WO	**BUF:** Buffered Mode (BUF): Must be cleared for non-buffered mode. Writing 1 will result in undefined behavior.
2	0b WO	**MSBM:** Master/Slave in Buffered Mode (MSBM): Not used. Should always be programmed to 0.
1	0b WO	**AEOI:** Automatic End of Interrupt (AEOI): This bit should normally be programmed to 0. This is the normal end of interrupt. If this bit is 1, the automatic end of interrupt mode is programmed.
0	1b WO	**MM:** Microprocessor Mode (MM): This bit must be written to 1 to indicate that the controller is operating in an Intel Architecture-based system. Writing 0 will result in undefined behavior.

42.3.14 SOCW1—Offset ADh

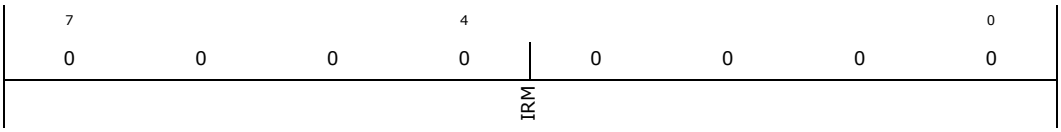
Slave Operational Control Word 1 (Interrupt Mask)

Access Method

Type: I/O Register
(Size: 8 bits)

SOCW1: ADh

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**IRM:** Interrupt Request Mask (IRM): When a 1 is written to any bit in this register, the corresponding IRQ line is masked. When a 0 is written to any bit in this register, the corresponding IRQ mask bit is cleared, and interrupt requests will again be accepted by the controller. Masking IRQ2 on the master controller will also mask the interrupt requests from the slave controller.

42.3.15 ELCR1—Offset 4D0h

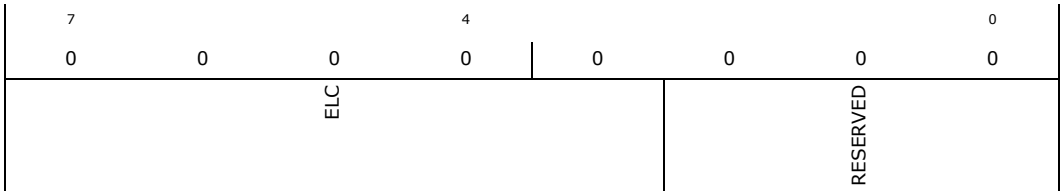
Master Edge/Level Control

Access Method

Type: I/O Register
(Size: 8 bits)

ELCR1: 4D0h

Default: 00h



Bit Range	Default & Access	Description
7:3	X RW	**ELC:** Edge Level Control (ECL[7:3]): In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level.
2:0	0b RO	**RESERVED:** Reserved.

42.3.16 ELCR2—Offset 4D1h

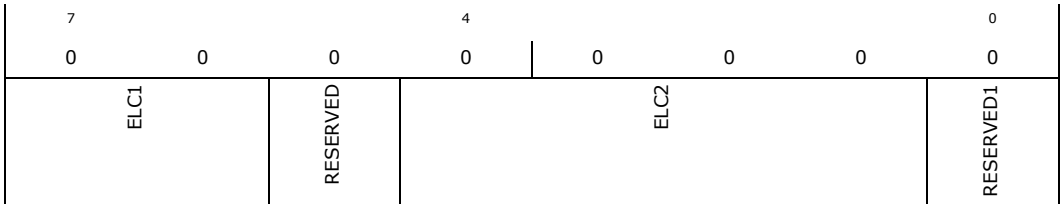
Slave Edge/Level Control

Access Method

Type: I/O Register
(Size: 8 bits)

ELCR2: 4D1h

Default: 00h



Bit Range	Default & Access	Description
7:6	X RW	**ELC1:** Edge Level Control (ECL[15:14]): In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. Bit 7 applies to IRQ15, and bit 6 to IRQ14.
5	0b RO	**RESERVED:** Reserved.
4:1	X RW	**ELC2:** Edge Level Control (ECL[12:9]: In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. Bit 4 applies to IRQ12, bit 3 to IRQ11, bit 2 to IRQ10, and bit 1 to IRQ9.
0	0b RO	**RESERVED (RESERVED1):** Reserved.
