Rev. 2.00
August 2004

The Intersil ISL8391-ISL8393 devices are CMOS, precision, quad analog switches designed to operate from a single +2 V to +12 V supply or from $\mathrm{a} \pm 2 \mathrm{~V}$ to $\pm 6 \mathrm{~V}$ supply. Targeted applications include battery powered equipment that benefit from the devices' low power consumption $(<1 \mu \mathrm{~W})$, low leakage currents ( $2.5 n A$ max), and fast switching speeds ( t ON $=60 \mathrm{~ns}$, $\mathrm{t}_{\mathrm{OFF}}=30 \mathrm{~ns}$ ). A $4 \Omega$ maximum R $\mathrm{R}_{\mathrm{ON}}$ flatness ensures signal fidelity, while channel-to-channel mismatch is guaranteed to be less than $2 \Omega$.

The ISL8391, ISL8392, and ISL8393 are quad single-pole/single-throw (SPST) devices. The ISL8391 has four normally closed (NC) switches; the ISL8392 has four normally open (NO) switches; the ISL8393 has two NO and two NC switches and can be used as a dual SPDT, or a dual 2:1 multiplexer.
Table 1 summarizes the performance of this family. For higher performance, pin compatible versions, see the ISL43143-5 data sheet.
table 1. features at a glance

|  | ISL8391 | ISL8392 | ISL8393 |
| :---: | :---: | :---: | :---: |
| Number of Switches | 4 | 4 | 4 |
| Configuration | All NC | All NO | $2 \mathrm{NC/2} \mathrm{NO}$ |
| $\pm 5 \mathrm{~V}$ R ON | $20 \Omega$ | $20 \Omega$ | $20 \Omega$ |
| $\pm 5 \mathrm{~V}$ ton/toff | $60 \mathrm{~ns} / 30 \mathrm{~ns}$ | $60 \mathrm{~ns} / 30 \mathrm{~ns}$ | $60 \mathrm{~ns} / 30 \mathrm{~ns}$ |
| 5 V RON | $30 \Omega$ | $30 \Omega$ | $30 \Omega$ |
| 5 V ton/toff | $85 \mathrm{~ns} / 25 \mathrm{~ns}$ | $85 \mathrm{~ns} / 25 \mathrm{~ns}$ | $85 \mathrm{~ns} / 25 \mathrm{~ns}$ |
| 3 V RON | $83 \Omega$ | $83 \Omega$ | $83 \Omega$ |
| 3V ton/toff | $140 \mathrm{~ns} / 55 \mathrm{~ns}$ | 140ns/55ns | 140ns/55ns |
| Packages | 16 Ld SOIC (N) |  |  |

## Features

- Pin Compatible Replacements for MAX391-MAX393
- Four Separately Controlled SPST Switches
- Pin Compatible with DG411, DG412, DG413
- ON Resistance (RON) . . . . . . . . . . . . 20 20 (Typ) $35 \Omega$ (Max)
- RON Matching Between Channels. . . . . . . . . . . . . . . . . . $<1 \Omega$
- Low Power Consumption ( $\mathrm{P}_{\mathrm{D}}$ ) . . . . . . . . . . . . . . . . . . . . $<1 \mu \mathrm{~W}$
- Low Leakage Current (Max at $85^{\circ} \mathrm{C}$ ) . . . . . . . . . . . . . 2.5nA
- Fast Switching Action
- ton ............................................. . . . 60ns
- torf . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 30ns
- Minimum 2000V ESD Protection per Method 3015.7
- TTL, CMOS Compatible
- Pb-free available

## Applications

- Battery Powered, Handheld, and Portable Equipment
- Barcode Scanners
- Laptops, Notebooks, Palmtops
- Communications Systems
- Radios
- Base Stations
- RF "Tee" Switches
- Test Equipment
- Ultrasound
- CAT/PET SCAN
- Electrocardiograph
- Audio and Video Switching
- General Purpose Circuits
- +3V/+5V DACs and ADCs
- Digital Filters
- Operational Amplifier Gain Switching Networks
- High Frequency Analog Switching
- High Speed Multiplexing

| $\left.{ }^{\circ} \mathrm{C}\right)$ |  |$)$

*Add "-T" suffix to part number for tape and reel packaging.
NOTE:
2. Intersil Pb -free products employ special Pb -free material sets; molding compounds/die attach materials and $100 \%$ matte tin plate termination finish, which is compatible with both SnPb and Pb -free soldering operations. Intersil Pb -free products are MSL classified at Pb -free peak reflow temperatures that meet or exceed the Pb -free requirements of IPC/JEDEC J Std-020B.

## Absolute Maximum Ratings

| $\mathrm{V}+$ to V- | -0.3 to15V |
| :---: | :---: |
| V+ to GND | -0.3 to15V |
| V- to GND | -15 to 0.3V |
| All Other Pins (Note 3) . . . . . . . . . . . . ((V-) | V+) + 0.3V) |
| Continuous Current (Any Terminal) | 30 mA |
| Peak Current, IN, NO, NC, or COM (Pulsed 1ms, 10\% Duty Cycle, Max) | $100 \mathrm{~mA}$ |
| ESD Rating (Per MIL-STD-883 Method 3015) | . . $>2 \mathrm{kV}$ |

## Thermal Information

| Thermal Resistance (Typical, Note 4) | $\theta_{\mathrm{JA}}\left({ }^{\circ} \mathrm{C} / \mathrm{W}\right)$ |
| :---: | :---: |
| 16 Ld SOIC Package | 115 |
| Maximum Junction Temperature (Plastic Package) | $150^{\circ} \mathrm{C}$ |
| Moisture Sensitivity (See Technical Brief TB363) |  |
| All Packages | Level 1 |
| Maximum Storage Temperature Range. | $-65^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$ |
| Maximum Lead Temperature (Soldering 10s) (Lead Tips Only) | $300^{\circ} \mathrm{C}$ |

## Operating Conditions

Temperature Range
ISL839XIX . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:
3. Signals on NC, NO, COM, or IN exceeding V+ or V- are clamped by internal diodes. Limit forward diode current to maximum current ratings.
4. $\theta_{J A}$ is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.

Electrical Specifications: $\pm 5 \mathrm{~V}$ Supply Test Conditions: $\mathrm{V}_{\text {SUPPLY }}= \pm 4.5 \mathrm{~V}$ to $\pm 5.5 \mathrm{~V}, \mathrm{GND}=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{INH}}=2.4 \mathrm{~V}, \mathrm{~V}_{\mathrm{INL}}=0.8 \mathrm{~V}$ (Note 5 ),

NOTES:
5. $\mathrm{V}_{\mathrm{IN}}=$ Input voltage to perform proper function.
6. The algebraic convention, whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.
7. Leakage parameter is $100 \%$ tested at high temp, and guaranteed by correlation at $25^{\circ} \mathrm{C}$.
8. Flatness is defined as the delta between the maximum and minimum $\mathrm{R}_{\mathrm{ON}}$ values over the specified voltage range. Flatness specifications are guaranteed only with specified voltages.
9. Between any two switches.

Electrical Specifications: 5V Supply Test Conditions: $\mathrm{V}+=+4.5 \mathrm{~V}$ to $+5.5 \mathrm{~V}, \mathrm{~V}-=\mathrm{GND}=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{INH}}=2.4 \mathrm{~V}, \mathrm{~V}_{\mathrm{INL}}=0.8 \mathrm{~V}$ (Note 5), Unless Otherwise Specified

Test Circuits and Waveforms

Logic input waveform is inverted for switches that have the opposite logic sense.

Repeat test for all switches. $C_{L}$ includes fixture and stray capacitance.

## Detailed Description

The ISL8391-ISL8393 quad analog switches offer precise switching capability from a bipolar $\pm 2 \mathrm{~V}$ to $\pm 6 \mathrm{~V}$ or a single 2 V to 12 V supply with low on-resistance ( $20 \Omega$ ) and high speed switching ( t ON $=60 \mathrm{~ns}$, toff $=30 \mathrm{~ns}$ ). The devices are especially well suited to portable battery powered equipment thanks to the low operating supply voltage ( 2 V ), low power consumption $(1 \mu \mathrm{~W})$, low leakage currents ( 2.5 nA max). High frequency applications also benefit from the wide bandwidth, and the very high OFF isolation and crosstalk rejection.

## Supply Sequencing And Overvoltage Protection

As with any CMOS device, proper power supply sequencing is required to protect the device from excessive input currents which might permanently damage the IC. All I/O pins contain ESD protection diodes from the pin to $V+$ and to V- (see Figure 8). To prevent forward biasing these diodes, V+ and V- must be applied before any input signals, and input signal voltages must remain between $\mathrm{V}+$ and V -. If these conditions cannot be guaranteed, then one of the following two protection methods should be employed.

Logic inputs can easily be protected by adding a $1 \mathrm{k} \Omega$ resistor in series with the input (see Figure 8). The resistor limits the input current below the threshold that produces permanent damage, and the sub-microamp input current produces an insignificant voltage drop during normal operation.

Adding a series resistor to the switch input defeats the purpose of using a low $\mathrm{R}_{\mathrm{ON}}$ switch, so two small signal diodes can be added in series with the supply pins to provide overvoltage protection for all pins (see Figure 8). These additional diodes limit the analog signal from 1 V below $\mathrm{V}+$ to 1 V above V -. The low leakage current performance is

FIGURE 7. CAPACITANCE TEST CIRCUIT
unaffected by this approach, but the switch resistance may increase, especially at low supply voltages.

FIGURE 8. OVERVOLTAGE PROTECTION

## Power-Supply Considerations

The ISL839X construction is typical of most CMOS analog switches, in that they have three supply pins: V+, V-, and GND. V+ and V-drive the internal CMOS switches and set their analog voltage limits, so there are no connections between the analog signal path and GND. Unlike switches with a 13 V maximum supply voltage, the ISL839X 15V maximum supply voltage provides plenty of room for the $10 \%$ tolerance of 12 V supplies ( $\pm 6 \mathrm{~V}$ or 12 V single supply), as well as room for overshoot and noise spikes.
This family of switches performs equally well when operated with bipolar or single voltage supplies, and bipolar supplies need not be symmetrical. The minimum recommended supply voltage is 2 V or $\pm 2 \mathrm{~V}$. It is important to note that the input signal range, switching times, and ON-resistance degrade at lower supply voltages. Refer to the electrical
specification tables and Typical Performance Curves for details.

V+ and GND power the internal logic (thus setting the digital switching point) and level shifters. The level shifters convert the logic levels to switched $V+$ and $V$ - signals to drive the analog switch gate terminals, so switch parameters especially $\mathrm{R}_{\mathrm{ON}}$ - are strong functions of both supplies.

## Logic-Level Thresholds

V+ and GND power the internal logic stages, so V- has no affect on logic thresholds. This switch family is TTL compatible ( 0.8 V and 2.4 V ) over a $\mathrm{V}+$ supply range of 2.5 V to 10 V . At 12 V the $\mathrm{V}_{\mathrm{IH}}$ level is about 2.7 V , so for best results use a logic family that provides a $\mathrm{V}_{\mathrm{OH}}$ greater than 3 V .
The digital input stages draw supply current whenever the digital input voltage is not at one of the supply rails. Driving the digital input signals from GND to V+ with a fast transition time minimizes power dissipation.

## High-Frequency Performance

In $50 \Omega$ systems, signal response is reasonably flat even past 200 MHz (see Figure 15), with a small signal -3dB bandwidth in excess of 300 MHz , and a large signal bandwidth exceeding 300 MHz .

An off switch acts like a capacitor and passes higher frequencies with less attenuation, resulting in signal feedthrough from a switch's input to its output. OFF Isolation is the resistance to this feedthrough, while Crosstalk
indicates the amount of feedthrough from one switch to another. Figure 16 details the high OFF Isolation and Crosstalk rejection provided by this family. At 10 MHz , OFF isolation is about 50 dB in $50 \Omega$ systems, decreasing approximately 20dB per decade as frequency increases. Higher load impedances decrease OFF Isolation and Crosstalk rejection due to the voltage divider action of the switch OFF impedance and the load impedance.

## Leakage Considerations

Reverse ESD protection diodes are internally connected between each analog-signal pin and both $\mathrm{V}+$ and V -. One of these diodes conducts if any analog signal exceeds $\mathrm{V}+$ or V -.

Virtually all the analog leakage current comes from the ESD diodes to V+ or V-. Although the ESD diodes on a given signal pin are identical and therefore fairly well balanced, they are reverse biased differently. Each is biased by either $\mathrm{V}+$ or V - and the analog signal. This means their leakages will vary as the signal varies. The difference in the two diode leakages to the $V+$ and $V$ - pins constitutes the analog-signalpath leakage current. All analog leakage current flows between each pin and one of the supply terminals, not to the other switch terminal. This is why both sides of a given switch can show leakage currents of the same or opposite polarity. There is no connection between the analog signal paths and GND.

NOTES:

1. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension " $D$ " does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15 mm ( 0.006 inch ) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25 mm ( 0.010 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. " $L$ " is the length of terminal for soldering to a substrate.
7. " N " is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. The lead width " $B$ ", as measured 0.36 mm ( 0.014 inch ) or greater above the seating plane, shall not exceed a maximum value of 0.61 mm ( 0.024 inch $)$
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.
