## InvenSense

### 1.2 Purpose and Scope

This document is a product specification, providing a description, specifications, and design related information for the dual axis IXZ-2510 ${ }^{\text {TM }}$ gyroscope. The device is housed in a small $3 \times 3 \times 0.90 \mathrm{~mm}$ QFN package.

### 1.3 Product Overview

The IXZ-2510 is a single-chip, digital output, 2 Axis MEMS gyroscope IC which features a 512-byte FIFO. The FIFO can lower the traffic on the serial bus interface, and reduce power consumption by allowing the system processor to burst read sensor data and then go into a low-power mode.

The gyroscope includes a programmable full-scale range of $\pm 250, \pm 500, \pm 1000$, and $\pm 2000$ degrees/sec, very low Rate noise at $0.01 \mathrm{dps} / \sqrt{ } \mathrm{Hz}$ and extremely low power consumption at 2.8 mA . Factory-calibrated initial sensitivity reduces production-line calibration requirements.

Other industry-leading features include on-chip 16-bit ADCs, programmable digital filters, a precision clock with $1 \%$ drift from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$, an embedded temperature sensor, and programmable interrupts. The device features $I^{2} \mathrm{C}$ and SPI serial interfaces, a VDD operating range of 1.71 to 3.6 V , and a separate digital IO supply, VDDIO from 1.71 V to 3.6 V .

By leveraging its patented and volume-proven Nasiri-Fabrication platform, which integrates MEMS wafers with companion CMOS electronics through wafer-level bonding, InvenSense has driven the gyro package size down to a footprint and thickness of $3 \times 3 \times 0.90 \mathrm{~mm}$ ( 16 -pin QFN), to provide a very small yet high performance low cost package. The device provides high robustness by supporting $10,000 \mathrm{~g}$ shock reliability.

### 1.4 Applications

- Toys
- Tools
- Industrial

## 2 Features

The IXZ-2510 MEMS gyroscope includes a wide range of features:

### 2.1 Sensors

- Monolithic X-, Z- Axis angular rate sensor (gyros) integrated circuit
- Digital-output temperature sensor
- External sync signal connected to the FSYNC pin supports image, video and GPS synchronization
- Factory calibrated scale factor
- High cross-axis isolation via proprietary MEMS design
- $10,000 \mathrm{~g}$ shock tolerant

### 2.2 Digital Output

- Fast Mode ( 400 kHz ) $\mathrm{I}^{2} \mathrm{C}$ serial interface
- 1 MHz SPI serial interface for full read/write capability
- 20 MHz SPI to read gyro sensor \& temp sensor data.
- 16-bit ADCs for digitizing sensor outputs
- User-programmable full-scale-range of $\pm 250, \pm 500, \pm 1000$, and $\pm 2000 \%$ sec

### 2.3 Data Processing

- The total data set obtained by the device includes gyroscope data, temperature data, and the one bit external sync signal connected to the FSYNC pin.
- FIFO allows burst read, reduces serial bus traffic and saves power on the system processor.
- FIFO can be accessed through both $\mathrm{I}^{2} \mathrm{C}$ and SPI interfaces.
- Programmable interrupt
- Programmable low-pass filters

### 2.4 Clocking

- On-chip timing generator clock frequency $\pm 1 \%$ drift over full temperature range

### 2.5 Power

- VDD supply voltage range of 1.71 V to 3.6 V
- Flexible VDDIO reference voltage allows for multiple $I^{2} \mathrm{C}$ and SPI interface voltage levels
- Power consumption with both axes active: 2.8 mA
- Sleep mode: $8 \mu \mathrm{~A}$
- Each axis can be individually powered down

### 2.6 Package

- $3 \times 3 \times 0.90 \mathrm{~mm}$ footprint and maximum thickness 16 -pin QFN plastic package
- MEMS structure hermetically sealed at wafer level
- RoHS and Green compliant

### 3.2 Electrical Specifications

Typical Operating Circuit of Section 4.2, VDD $=2.5 \mathrm{~V}, \mathrm{VDDIO}=1.8 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$.

| Parameters | Conditions | Min | Typical | Max | Units | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| VDD POWER SUPPLY |  |  |  |  |  |  |
| Operating Voltage Range |  | 1.71 |  | 3.6 | V |  |
| Power-Supply Ramp Rate | Monotonic ramp. Ramp rate is $10 \%$ to $90 \%$ of the final value | 1 |  | 100 | ms |  |
| Normal Operating Current | Two Axes Active |  | 2.8 |  | mA |  |
| Sleep Mode Current |  |  | 8 |  | $\mu \mathrm{A}$ |  |
| VDDIO REFERENCE VOLTAGE (must be regulated) |  |  |  |  |  |  |
| Voltage Range |  | 1.71 |  | 3.6 | V |  |
| Power-Supply Ramp Rate | Monotonic ramp. Ramp rate is $10 \%$ to $90 \%$ of the final value | 0.1 |  | 100 | ms |  |
| Normal Operating Current | 10pF load, 5 MHz data rate. Does not include pull up resistor current draw as that is system dependent |  | 300 |  | $\mu \mathrm{A}$ |  |
| START-UP TIME FOR REGISTER READ/WRITE |  |  | 12 |  | ms |  |
| $1^{2} \mathrm{C}$ ADDRESS | $\begin{aligned} & \text { ADO }=0 \\ & \text { ADO }=1 \end{aligned}$ |  | $\begin{aligned} & 1101000 \\ & 1101001 \\ & \hline \end{aligned}$ |  |  |  |
| DIGITAL INPUTS (FSYNC, ADO, SCLK, SDI, /CS) <br> $\mathrm{V}_{\mathrm{IH}}$, High Level Input Voltage <br> $\mathrm{V}_{\mathrm{L}}$, Low Level Input Voltage <br> CI, Input Capacitance |  | 0.7*VDDIO | < 5 | 0.3*VDDIO | $\begin{gathered} \mathrm{V} \\ \mathrm{~V} \\ \mathrm{pF} \end{gathered}$ |  |
| DIGITAL OUTPUT (INT, SDO) |  |  |  |  |  |  |
| $\mathrm{V}_{\text {он, }}$, High Level Output Voltage | $\mathrm{R}_{\text {LOAD }}=1 \mathrm{M} \Omega$ | 0.9*VDDIO |  |  | V |  |
| V $\mathrm{OLL}^{\text {, L LOW-Level Otput Voltage }}$ | $\mathrm{R}_{\text {LOAD }}=1 \mathrm{M} \Omega$ |  |  | 0.1*VDDIO | V |  |
| VoL.INT1, INT Low-Level Output Voltage | OPEN=1, 0.3mA sink current |  |  | 0.1 | V |  |
| Output Leakage Current twi INT Pulse Width | $\begin{aligned} & \text { OPEN=1 } \\ & \text { LATCH_INT_EN=0 } \end{aligned}$ |  | $\begin{gathered} 100 \\ 50 \end{gathered}$ |  | nA |  |

Note: Power-Supply Ramp Rates are defined as the time it takes for the voltage to rise from $10 \%$ to $90 \%$ of the final value. VDD and VDDIO must be monotonic ramps.

### 3.6 Absolute Maximum Ratings

Stress above those listed as "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to the absolute maximum ratings conditions for extended periods may affect device reliability.

## Absolute Maximum Ratings

| Parameter | Rating |
| :--- | :---: |
| Supply Voltage, VDD | -0.5 V to +4.0 V |
| VDDIO Input Voltage Level | -0.5 V to 4.0 V |
| REGOUT | -0.5 V to 2 V |
| Input Voltage Level (AD0, FSYNC) | -0.5 V to VDD |
| SCL, SDA, INT (SPI enable) | -0.5 V to VDD |
| SCL, SDA, INT (SPI disable) | -0.5 V to VDD |
| Acceleration (Any Axis, unpowered) | $10,000 \mathrm{~g}$ for 0.2 ms |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+85^{\circ}$ |
| Storage Temperature Range | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Electrostatic Discharge (ESD) Protection | $2 \mathrm{kV}(\mathrm{HBM}) ; 200 \mathrm{~V}(\mathrm{MM})$ |
| Latch-up | JEDEC Class II (2), $125^{\circ} \mathrm{C}, \pm 100 \mathrm{~mA}$ |

## 5 Functional Overview

### 5.1 Block Diagram

### 5.2 Overview

The IXZ-2510 is comprised of the following key blocks / functions:

- Dual-axis MEMS rate gyroscope sensor with 16-bit ADCs and signal conditioning
- $I^{2} \mathrm{C}$ and SPI serial communications interfaces
- Clocking
- Sensor Data Registers
- FIFO
- Interrupts
- Digital-Output Temperature Sensor
- Bias and LDO

### 5.3 Dual-Axis MEMS Gyroscope with 16-bit ADCs and Signal Conditioning

The IXZ-2510 consists of a single structure vibratory MEMS rate gyroscope, which detects rotation about the X and Z axes. When the gyro is rotated about any of the sense axes, the Coriolis Effect causes a vibration that is detected by a capacitive pick off. The resulting signal is amplified, demodulated, and filtered to produce a voltage that is proportional to the angular rate. This voltage is digitized using individual on-chip 16-bit Analog-to-Digital Converters (ADCs) to sample each axis. The chip features a programmable fullscale range of the gyro sensors of $\pm 250, \pm 500, \pm 1000$, and $\pm 2000$ dps. User-selectable low-pass filters enable a wide range of cut-off frequencies. The ADC sample rate can be programmed to $32 \mathrm{kHz}, 8 \mathrm{kHz}, 1$ kHz, $500 \mathrm{~Hz}, 333.3 \mathrm{~Hz}, 250 \mathrm{~Hz}, 200 \mathrm{~Hz}, 166.7 \mathrm{~Hz}, 142.9 \mathrm{~Hz}$, or 125 Hz .

## $5.4 \quad I^{2} \mathrm{C}$ and SPI Serial Communications Interface

The IXZ-2510 has both $I^{2} \mathrm{C}$ and SPI serial interfaces. The device always acts as a slave when communicating to the system processor. The logic level for communications to the master is set by the voltage on the VDDIO pin. The LSB of the of the $I^{2} \mathrm{C}$ slave address is set by the ADO pin. The $I^{2} \mathrm{C}$ and SPI protocols are described in more detail in Section 6.

## IXZ-2510 Product Specification

### 5.5 Internal Clock Generation

The IXZ-2510 has a flexible clocking scheme, allowing for a variety of internal clock sources for the internal synchronous circuitry. This synchronous circuitry includes the signal conditioning and ADCs, various control circuits, and registers.

Allowable internal sources for generating the internal clock are:

- An internal relaxation oscillator
- PLL (gyroscope based clock)

In order for the gyroscope to perform to spec, the PLL must be selected as the clock source. When the internal 20 MHz oscillator is chosen as the clock source, the device can operate while having the gyroscopes disabled. However, this is only recommended if the user wishes to use the internal temperature sensor in this mode.

### 5.6 Sensor Data Registers

The sensor data registers contain the latest gyro and temperature data. They are read-only registers, and are accessed via the Serial Interface. Data from these registers may be read anytime, however, the interrupt function may be used to determine when new data is available.

### 5.7 FIFO

The IXZ-2510 contains a 512-byte FIFO register that is accessible via the both the $I^{2} \mathrm{C}$ and SPI Serial Interfaces. The FIFO configuration register determines what data goes into it, with possible choices being gyro data, temperature readings and FSYNC input. A FIFO counter keeps track of how many bytes of valid data are contained in the FIFO. The FIFO register supports burst reads. The interrupt function may be used to determine when new data is available.

### 5.8 Interrupts

Interrupt functionality is configured via the Interrupt Configuration register. Items that are configurable include the INT pin configuration, the interrupt latching and clearing method, and triggers for the interrupt. Items that can trigger an interrupt are (1) Clock generator locked to new reference oscillator (used when switching clock sources), (2) new data is available to be read (from the FIFO and Data registers), and (3) FIFO overflow. The interrupt status can be read from the Interrupt Status register.

### 5.9 Digital-Output Temperature Sensor

An on-chip temperature sensor and ADC are used to measure the device's die temperature. The readings from the ADC can be read from the FIFO or the Sensor Data registers.

### 5.10 Bias and LDO

The bias and LDO section generates the internal supply and the reference voltages and currents required by the IXZ-2510. Its two inputs are unregulated VDD of 1.71 V to 3.6 V and a VDDIO logic reference supply voltage of 1.71 V to 3.6 V . The LDO output is bypassed by a $0.1 \mu \mathrm{~F}$ capacitor at REGOUT.

## IXZ-2510 Product Specification

## 6 Digital Interface

## $6.1 \quad I^{2} \mathrm{C}$ Serial Interface

The internal registers and memory of the IXZ-2510 can be accessed using the $I^{2} \mathrm{C}$ interface.

## Serial Interface

| Pin Number | Pin Name | Pin Description |
| :---: | :---: | :--- |
| 1 | VDDIO | Digital I/O supply voltage. |
| 4 | ADO / SDO | $I^{2} \mathrm{C}$ Slave Address LSB (ADO); SPI serial data output (SDO) |
| 2 | SCL / SCLK | $\mathrm{I}^{2} \mathrm{C}$ serial clock (SCL); SPI serial clock (SCLK) |
| 3 | SDA / SDI | $\mathrm{I}^{2} \mathrm{C}$ serial data (SDA); SPI serial data input (SDI) |

### 6.1.1 $I^{2} \mathrm{C}$ Interface

${ }^{2} \mathrm{C}$ is a two-wire interface comprised of the signals serial data (SDA) and serial clock (SCL). In general, the lines are open-drain and bi-directional. In a generalized $\mathrm{I}^{2} \mathrm{C}$ interface implementation, attached devices can be a master or a slave. The master device puts the slave address on the bus, and the slave device with the matching address acknowledges the master.

The IXZ-2510 always operates as a slave device when communicating to the system processor, which thus acts as the master. SDA and SCL lines typically need pull-up resistors to VDD. The maximum bus speed is 400 kHz .

The slave address of the device is b110100X which is 7 bits long. The LSB bit of the 7 bit address is determined by the logic level on pin ADO. This allows two IXZ-2510 devices to be connected to the same $I^{2} \mathrm{C}$ bus. When used in this configuration, the address of the one of the devices should be b1101000 (pin AD0 is logic low) and the address of the other should be b1101001 (pin AD0 is logic high). The $\mathrm{I}^{2} \mathrm{C}$ address is stored in WHO_AM_I register.

## $1^{2} \mathrm{C}$ Communications Protocol

## START (S) and STOP ( $P$ ) Conditions

Communication on the $I^{2} C$ bus starts when the master puts the START condition ( S ) on the bus, which is defined as a HIGH-to-LOW transition of the SDA line while SCL line is HIGH (see figure below). The bus is considered to be busy until the master puts a STOP condition ( P ) on the bus, which is defined as a LOW to HIGH transition on the SDA line while SCL is HIGH (see figure below).
Additionally, the bus remains busy if a repeated START $(\mathrm{Sr})$ is generated instead of a STOP condition.

## START and STOP Conditions

> IXZ-2510 Product Specification

## Data Format / Acknowledge

$I^{2} \mathrm{C}$ data bytes are defined to be 8 bits long. There is no restriction to the number of bytes transmitted per data transfer. Each byte transferred must be followed by an acknowledge (ACK) signal. The clock for the acknowledge signal is generated by the master, while the receiver generates the actual acknowledge signal by pulling down SDA and holding it low during the HIGH portion of the acknowledge clock pulse.
If a slave is busy and is unable to transmit or receive another byte of data until some other task has been performed, it can hold SCL LOW, thus forcing the master into a wait state. Normal data transfer resumes when the slave is ready, and releases the clock line (refer to the following figure).

## Acknowledge on the $\mathrm{I}^{2} \mathrm{C}$ Bus

## Communications

After beginning communications with the START condition (S), the master sends a 7 -bit slave address followed by an $8^{\text {th }}$ bit, the read/write bit. The read/write bit indicates whether the master is receiving data from or is writing to the slave device. Then, the master releases the SDA line and waits for the acknowledge signal (ACK) from the slave device. Each byte transferred must be followed by an acknowledge bit. To acknowledge, the slave device pulls the SDA line LOW and keeps it LOW for the high period of the SCL line. Data transmission is always terminated by the master with a STOP condition (P), thus freeing the communications line. However, the master can generate a repeated START condition (Sr), and address another slave without first generating a STOP condition (P). A LOW to HIGH transition on the SDA line while SCL is HIGH defines the stop condition. All SDA changes should take place when SCL is low, with the exception of start and stop conditions.

## InvenSense

## IXZ-2510 Product Specification

To write the internal IXZ-2510 registers, the master transmits the start condition (S), followed by the $I^{2} \mathrm{C}$ address and the write bit ( 0 ). At the $9^{\text {th }}$ clock cycle (when the clock is high), the device acknowledges the transfer. Then the master puts the register address (RA) on the bus. After the device acknowledges the reception of the register address, the master puts the register data onto the bus. This is followed by the ACK signal, and data transfer may be concluded by the stop condition (P). To write multiple bytes after the last ACK signal, the master can continue outputting data rather than transmitting a stop signal. In this case, the device automatically increments the register address and loads the data to the appropriate register. The following figures show single and two-byte write sequences.

## Single-Byte Write Sequence

| Master | S | AD + W |  | RA |  | DATA |  | P |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Slave |  |  | ACK |  | ACK |  | ACK |  |

Burst Write Sequence

| Master | S | AD +W |  | RA |  | DATA |  | DATA |  | P |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Slave |  |  | ACK |  | ACK |  | ACK |  | ACK |  |

To read the internal device registers, the master sends a start condition, followed by the $\mathrm{I}^{2} \mathrm{C}$ address and a write bit, and then the register address that is going to be read. Upon receiving the ACK signal from the device, the master transmits a start signal followed by the slave address and read bit. As a result, the device sends an ACK signal and the data. The communication ends with a not acknowledge (NACK) signal and a stop bit from master. The NACK condition is defined such that the SDA line remains high at the $9^{\text {th }}$ clock cycle. The following figures show single and two-byte read sequences.

## Single-Byte Read Sequence

| Master | S | AD + W |  | RA |  | S | AD+R |  |  | NACK | P |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Slave |  |  | ACK |  | ACK |  |  | ACK | DATA |  |  |

Burst Read Sequence

| Master | S | AD +W |  | RA |  | S | AD+R |  |  | ACK |  | NACK | P |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Slave |  |  | ACK |  | ACK |  |  | ACK | DATA |  | DATA |  |  |

## IXZ-2510 Product Specification

$1^{2} \mathrm{C}$ Terms

| Signal | Description |
| :---: | :--- |
| S | Start Condition: SDA goes from high to low while SCL is high |
| AD | Slave I $^{2}$ C address |
| W | Write bit (0) |
| R | Read bit (1) |
| ACK | Acknowledge: SDA line is low while the SCL line is high at the $9^{\text {th }}$ clock cycle |
| NACK | Not-Acknowledge: SDA line stays high at the $9^{\text {th }}$ clock cycle |
| RA | The internal register address |
| DATA | Transmit or received data |
| P | Stop condition: SDA going from low to high while SCL is high |

### 6.1.2 SPI interface

SPI is a 4-wire synchronous serial interface that uses two control and two data lines. The IXZ-2510 always operates as a Slave device during standard Master-Slave SPI operation. With respect to the Master, the Serial Clock output (SCLK), the Data Output (SDO) and the Data Input (SDI) are shared among the Slave devices. The Master generates an independent Chip Select (/CS) for each Slave device; /CS goes low at the start of transmission and goes back high at the end. The Serial Data Output (SDO) line, remains in a highimpedance (high-z) state when the device is not selected, so it does not interfere with any active devices.

## SPI Operational Features

1. Data is delivered MSB first and LSB last
2. Data is latched on rising edge of SCLK
3. Data should be transitioned on the falling edge of SCLK
4. SCLK frequency is 1 MHz max for SPI in full read/write capability mode. When the SPI frequency is set to 20 MHz , its operation is limited to reading sensor registers only.
5. SPI read and write operations are completed in 16 or more clock cycles (two or more bytes). The first byte contains the SPI Address, and the following byte(s) contain(s) the SPI data. The first bit of the first byte contains the Read/Write bit and indicates the Read (1) or Write (0) operation. The following 7 bits contain the Register Address. In cases of multiple-byte Read/Writes, data is two or more bytes:

## SPI Address format

| MSB |  |  |  |  |  |  | LSB |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| R/W | A6 | A5 | A4 | A3 | A2 | A1 | A0 |

SPI Data format

| MSB |  |  |  |  |  |  | LSB |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |

6. Supports Single or Burst Read/Writes.

| /IVE/SE/ISE | IXCument Number: PS-IXZ-2510A-00 <br> Revision: 1.1 <br> Release Date: $9 / 23 / 2016$ |
| :--- | :--- | :--- |

## Typical SPI Master / Slave Configuration

Each SPI slave requires its own Chip Select (/CS) line. SDO, SDI and SCLK lines are shared. Only one /CS line is active (low) at a time ensuring that only one slave is selected at a time. The /CS lines of other slaves are held high which causes their respective SDO pins to be high-Z.

## 7 Serial Interface Considerations

### 7.1 Supported Interfaces

The IXZ-2510 supports $I^{2} \mathrm{C}$ and SPI communication.

### 7.2 Logic Levels

The I/O logic levels are set to VDDIO. VDDIO may be set to be equal to VDD or to another voltage, such that it is between 1.71 V and 3.6 V at all times. Both $I^{2} \mathrm{C}$ and SPI communication support VDDIO.

Note: Register Names ending in _H and _L contain the high and low bytes, respectively, of an internal register value.

In the detailed register tables that follow, register names are in capital letters, while register values are in capital letters and italicized. For example, the GYRO_XOUT_H register (Register 67) contains the 8 most significant bits, GYRO_XOUT15:8], of the 16 -bit X-Axis gyroscope measurement, GYRO_XOUT.

The reset value is $0 \times 00$ for all registers other than the WHO_AM_I register (Register 117), which resets to $0 \times 68$.

## 10 Register Descriptions

This section describes the function and contents of each register.
Note: The device will come up in full power mode upon power-up. (i.e. not sleep mode)

| 08 | 08 | YG_OFFS_TC_L [7:0] |  |  |  |  |  |  |  |
| 0A | 10 |  |  |  |  |  |  | ZG_OFFS_TC_H [9] | $\underset{[8]}{\text { ZG_OFFS_TC_H }}$ |
| OB | 11 | ZG_OFFS_TC_L [7:0] |  |  |  |  |  |  |  |

## Description:

The temperature compensation (TC) registers are used to reduce gyro offset variation due to temperature change. The TC feature is always enabled. However the compensation only happens when a non-zero TC coefficient is programed during factory trim which gets loaded into these registers at power up or after a DEVICE_RESET. If these registers contain a value of zero, temperature compensation has no effect on the offset of the chip. The TC registers are 10-bit signed values in 2 's complement format with a resolution of $2.52 \mathrm{mdps} / \mathrm{C}$ steps.

If these registers contain a non-zero value after power up, the user may write zeros to them to see the offset values without TC with temperature variation. Note that doing so may result in offset values that exceed data sheet "Initial ZRO Tolerance" in other than normal ambient temperature ( $\sim 21^{\circ} \mathrm{C}$ ). The TC coefficients maybe restored by the user with a power up or a DEVICE_RESET.

## Parameters:

XG_OFFS_TC_H/L: 10-bit offset of $X$ gyroscope (2's complement)
YG_OFFS_TC_H/L: 10-bit offset of Y gyroscope (2's complement)
ZG_OFFS_TC_H/L: 10-bit offset of Z gyroscope (2's complement)

### 10.2 Registers 19 to 24 - Gyroscope offset adjustment

XG_OFFS_USRH, XG_OFFS_USRL, YG_OFFS_USRH, YG_OFFS_USRL, ZG_OFFS_USRH, and ZG_OFFS_USRL
Type: Read/Write

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 14 | 20 | X_OFFS_USR[15:8] |  |  |  |  |  |  |
| 15 | 21 | X_OFFS_USR[7:0] |  |  |  |  |  |  |
| 16 | 22 | Y_OFFS_USR[15:8] |  |  |  |  |  |  |

| /IVRMSEMSE | IXZ-2510 Product Specification | Document Number: PS-IXZ-2510A-00 <br> Revision: 1.1 <br> Release Date: $9 / 23 / 2016$ |
| :--- | :--- | :--- |

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 17 | 23 | Z_OFFS_USR[15:8] |  |  |  |  |  |  |  |
| 18 | 24 | Z_OFFS_USR[7:0] |  |  |  |  |  |  |  |

## Description:

These registers are used to remove DC bias from the sensor outputs. The values in these registers are subtracted from the gyroscope sensor values before going into the sensor registers (see registers 67 to 72).

## Parameters:

XG_OFFS_USR_H/L: 16-bit offset of X gyroscope (2's complement)
YG_OFFS_USR_H/L: 16-bit offset of Y gyroscope (2's complement)
ZG_OFFS_USR_H/L: 16-bit offset of Z gyroscope (2's complement)

### 10.3 Register 25 - Sample Rate Divider <br> SMPRT_DIV <br> Type: Read/Write

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | Bit0 | 19 | 25 | SMPLRT_DIV[7:0] |
| :---: | :---: | :---: | :---: | :---: |

## Description:

This register specifies the divider from the gyroscope output rate that can be used to generate a reduced Sample Rate. Please note that this register is only effective when $F C H O I C E \_B[1: 0]=2$ 'b00 (Register 27) and DLPF_CFG $=1,2,3,4,5$, or 6 (Register 26).
When $F C O I C E \_B[1: 0]=2 ' b 00$ but DLPF_CFG $=0$ or 7 , the Sample Rate is fixed at 8 kHz and the divider in this register does not apply. When FCHOICE_B[1:0] = 2'b01, 2'b10, or 2'b11, the Sample Rate is fixed at 32 kHz and the divider in this register does not apply.
The sensor register output and FIFO output are both based on the Sample Rate.
When this register is effective under the FCOICE_B and DLPF_CFG settings, the reduced Sample Rate is generated by the formula below:

Sample Rate = Gyroscope Output Rate / ( 1 + SMPLRT_DIV)
where Gyroscope Output Rate $=1 \mathrm{kHz}$.

## Parameters:

SMPLRT_DIV 8-bit unsigned value. The Sample Rate is determined by dividing the gyroscope output rate by this value.

### 10.4 Register 26 - Configuration

CONFIG
Type: Read/Write

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1A | 26 | - | FIFO_MODE | EXT_SYNC_SET[2:0] | DLPF_CFG[2:0] |  |  |  |  |

## Description:

This register configures the FIFO's mode of operation, the external Frame Synchronization (FSYNC) pin sampling and the Digital Low Pass Filter (DLPF) setting. Please note that the DLPF can only be used when $F C H O I C E \_B[1: 0]=2 b$ '00 (Register 27).
When FIFO_MODE is set to 1 and the FIFO is full, additional writes will not be written to the FIFO. When this bit is equal to 0 and the FIFO is full, additional writes will be written to the FIFO, replacing the oldest data. In order to enable and disable writing to the FIFO, use the enable bits in Register 35. For further information regarding the FIFO's operation, please refer to Register 116.
An external signal connected to the FSYNC pin can be sampled by configuring EXT_SYNC_SET. Signal changes to the FSYNC pin are latched so that short strobes may be captured. The latched

| /IVEMSEMSE | IXZ-2510 Product Specification | Document Number: PS-IXZ-2510A-00 <br> Revision: 1.1 <br> Release Date: $9 / 23 / 2016$ |
| :--- | :--- | :--- |

FSYNC signal will be sampled at the Sampling Rate, as defined in register 25. After sampling, the latch will reset to the current FSYNC signal state.
The sampled value will be reported in place of the least significant bit in a sensor data register determined by the value of EXT_SYNC_SET according to the following table.

| EXT_SYNC_SET | FSYNC Bit Location |
| :---: | :--- |
| 0 | Input disabled |
| 1 | TEMP_OUT_L[0] |
| 2 | GYRO_XOUT_L[0] |
| 3 | GYRO_YOUT_L[0] |
| 4 | GYRO_ZOUT_L[0] |

The DLPF is configured by DLPF_CFG, when $F C H O I C E B[1: 0]=2 b^{\prime} 00$. The gyroscope and temperature sensor are filtered according to the value of $D L \bar{P} F_{-} C F G$ and $F C H O I C E=B$ as shown in the table below.

| FCHOICE_B |  | DLPF_CFG | Gyroscope |  |  | Temperature Sensor |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| <1> | <0> |  | Bandwidth (Hz) | Delay (ms) | Fs (kHz) | Bandwidth (Hz) | Delay (ms) |
| 0 | 0 | 0 | 250 | 0.97 | 8 | 4000 | 0.04 |
| 0 | 0 | 1 | 184 | 2.9 | 1 | 188 | 1.9 |
| 0 | 0 | 2 | 92 | 3.9 | 1 | 98 | 2.8 |
| 0 | 0 | 3 | 41 | 5.9 | 1 | 42 | 4.8 |
| 0 | 0 | 4 | 20 | 9.9 | 1 | 20 | 8.3 |
| 0 | 0 | 5 | 10 | 17.85 | 1 | 10 | 13.4 |
| 0 | 0 | 6 | 5 | 33.48 | 1 | 5 | 18.6 |
| 0 | 0 | 7 | 3600 | 0.17 | 8 | 4000 | 0.04 |
| x | 1 | x | 8800 | 0.064 | 32 | 4000 | 0.04 |
| 1 | 0 | X | 3600 | 0.11 | 32 | 4000 | 0.04 |

Bit 7 is reserved.

Parameters:
FIFO_MODE

EXT_SYNC_SET
DLPF_CFG

When set to 1 and the FIFO is full, additional writes will not be written to the FIFO.
When equal to 0 and the FIFO is full, additional writes will be written to the FIFO, replacing the oldest data.
In order to disable writing to the FIFO, use the enable bits in Register 35.
3 -bit unsigned value. Configures the FSYNC pin sampling.
3 -bit unsigned value. Configures the DLPF setting.

### 10.5 Register 27 - Gyroscope Configuration

## GYRO_CONFIG

Type: Read/Write

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1B | 27 | XG_ST | YG_ST | ZG_ST | FS_SEL[1:0] | - | FCHOICE_B[1:0] |  |  |

## Description:

This register is used to trigger gyroscope self test and configure the gyroscopes' full scale range.
Gyroscope self-test permits users to test the mechanical and electrical portions of the gyroscope. When self-test is activated by setting XG_ST, YG_ST, ZG_ST bits in register 27, the on-board electronics will actuate the appropriate sensor. This actuation will move the sensor's proof masses over a distance equivalent to a pre-defined Coriolis force. This proof mass displacement results in a change in the sensor output, which is reflected in the output signal. The output signal is used to observe the self-test response. The self-test response (STR) is stored in the sensor data output

| MYOMSAMS日 | IXZ-2510 Product Specification | Document Number: PS-IXZ-2510A-00 <br> Revision: 1.1 <br> Release Date: $9 / 23 / 2016$ |
| :--- | :--- | :--- |

registers $67-72$. This self-test-response is used to determine whether the part has passed or failed self-test
This self-test response must be within the limits provided in product specification document for the part to pass self-test. Otherwise, the part is deemed to have failed self-test.
FS_SEL selects the full scale range of the gyroscope outputs according to the following table.

| FS_SEL | Full Scale Range |
| :---: | :---: |
| 0 | $\pm 250 \% \mathrm{~s}$ |
| 1 | $\pm 500 \% / \mathrm{s}$ |
| 2 | $\pm 1000 \% / \mathrm{s}$ |
| 3 | $\pm 2000 \% \mathrm{~s}$ |

FCHOICE_B, in conjunction with $D L P F_{-} C F G$ (Register 26), is used to choose the gyroscope output setting. For further information regarding the operation of $F C H O I C E \_B$, please refer to Section 4.2. Bit 2 is reserved.

## Parameters:

XG_ST
YG_ST
ZG_ST
FS SEL
FCHOICE_B

Setting this bit causes the X axis gyroscope to perform self test.
Setting this bit causes the Y axis gyroscope to perform self test.
Setting this bit causes the $Z$ axis gyroscope to perform self test.
2-bit unsigned value. Selects the full scale range of gyroscopes.
2-bit unsigned value used to choose the gyroscope output setting.

IXZ-2510 Product Specification

### 10.6 Register 35 - FIFO Enable

FIFO_EN
Type: Read/Write

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 23 | 35 | TEMP_-_ <br> FIFO_EN | XG_-_N <br> FIFO_EN | YG_-EN <br> FIFO_EN | ZG_ <br> FIFO_EN | - | - | - | - |

## Description:

This register determines which sensor measurements are loaded into the FIFO buffer.
Data stored inside the sensor data registers (Registers 65 to 72) will be loaded into the FIFO buffer if a sensor's respective FIFO_EN bit is set to 1 in this register. The behavior of FIFO writes when the FIFO buffer is full can be configured with the FIFO_MODE bit (Register 26). In order to read the data in the FIFO buffer, the FIFO_EN bit (Register 106) must be enabled.
When a sensor's FIFO_EN bit is enabled in this register, data from the sensor data registers will be loaded into the FIFO buffer. The sensors are sampled at the Sample Rate as defined in Register 25. For further information regarding sensor data registers, please refer to Registers 65 to 72
Bits 3 through 0 are reserved.

## Parameters:

TEMP_FIFO_EN
XG_FIFO_EN
YG_ FIFO_EN
ZG_FIFO_EN

When set to 1, this bit enables TEMP_OUT_H and TEMP_OUT_L (Registers 65 and 66) to be written into the FIFO buffer.
When set to 1, this bit enables GYRO_XOUT_H and GYRO_XOUT_L (Registers 67 and 68) to be written into the FIFO buffer.
When set to 1, this bit enables GYRO_YOUT_H and GYRO_YOUT_L (Registers 69 and 70) to be written into the FIFO buffer.
When set to 1, this bit enables GYRO_ZOUT_H and GYRO_ZOUT_L (Registers 71 and 72) to be written into the FIFO buffer.

IXZ-2510 Product Specification

\subsection*{10.7 Register 55 - INT Pin / Bypass Enable Configuration INT_PIN_CFG <br> Type: Read/Write <br> | Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 37 | 55 | INT_LEVEL | INT_OPEN | LATCH <br> INT_EN | INT_RD <br> _CLEAR | FSYNC <br> INT_LEVEL | FSYNC <br> MODT_IN <br> MODE | - | - |}

## Description:

This register configures the behavior of the interrupt signals at the INT pins. This register is also used to enable the FSYNC Pin to be used as an interrupt to the host application processor.
Bits 1 and 0 are reserved.

## Parameters:

INT_LEVEL
INT_OPEN
LATCH_INT_EN

INT_RD_CLEAR

FSYNC_INT_LEVEL

FSYNC_INT_MODE_EN

When this bit is equal to 0 , the logic level for the INT pin is active high. When this bit is equal to 1 , the logic level for the INT pin is active low. When this bit is equal to 0 , the INT pin is configured as push-pull.
When this bit is equal to 1 , the INT pin is configured as open drain. When this bit is equal to 0 , the INT pin emits a 50 us long pulse. When this bit is equal to 1 , the INT pin is held high until the interrupt is cleared.
When this bit is equal to 0 , interrupt status bits are cleared only by reading INT_STATUS (Register 58)
When this bit is equal to 1 , interrupt status bits are cleared on any read operation.
When this bit is equal to 0 , the logic level for the FSYNC pin (when used as an interrupt to the host processor) is active high.
When this bit is equal to 1 , the logic level for the FSYNC pin (when used as an interrupt to the host processor) is active low.
When this bit is equal to 1 , the FSYNC pin will trigger an interrupt when it transitions to the level specified by FSYNC_INT_LEVEL. When a FSYNC interrupt is triggered, the FSYNC_INT bit in Register 58 will be set to 1 . An interrupt is sent to the host processor if the FSYNC interrupt is enabled by the FSYNC_INT_EN bit in Register 56. When this bit is equal to 0 , the FSYNC pin is disabled from causing an interrupt.

| MMQMSOMS日 | IXZ-2510 Product Specification | Document Number: PS-IXZ-2510A-00 <br> Revision: 1.1 <br> Release Date: $9 / 23 / 2016$ |

### 10.8 Register 56 - Interrupt Enable <br> INT_ENABLE

Type: Read/Write

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 38 | 56 | - | - | - | FIFO <br> OFOW <br> _EN | FSYNC <br> INT_EN | - | - | DATA <br> _RDY_EN |

## Description:

This register enables interrupt generation by interrupt sources.
For information regarding the interrupt status for of each interrupt generation source, please refer to Register 58.
Bits 7 through 5, 2, and 1 are reserved.

## Parameters:

FIFO_OFLOW_EN When set to 1, this bit enables a FIFO buffer overflow to generate an interrupt.
FSYNC_INT_EN

DATA_RDY_EN
When equal to 0 , this bit disables the FSYNC pin from causing an interrupt to the host processor.
When set to 1, this bit enables the FSYNC pin to be used as an interrupt to the host processor.
When set to 1 , this bit enables the Data Ready interrupt. The Data Ready interrupt is triggered when all the sensor registers have been written with the latest gyro sensor data.

IXZ-2510 Product Specification

### 10.9 Register 58 - Interrupt Status

INT_STATUS
Type: Read Only

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3 A | 58 | - | - | - | FIFO <br> _OFOW <br> _INT | FSYNC <br> _INT | - | - | DATA <br> RDY_INT |

## Description:

This register shows the interrupt status of each interrupt generation source. Each bit will clear after the register is read.
For information regarding the corresponding interrupt enable bits, please refer to Register 56.
Bits 7 through 5, 2, and 1 are reserved.
Parameters:
FIFO_OFLOW_INT This bit automatically sets to 1 when a FIFO buffer overflow interrupt has been generated.
The bit clears to 0 after the register has been read.
FSYNC_INT This bit automatically sets to 1 when an FSYNC interrupt has been generated.
The bit clears to 0 after the registers has been read.
DATA_RDY_INT This bit automatically sets to 1 when a Data Ready interrupt is generated.
The bit clears to 0 after the register has been read.

IXZ-2510 Product Specification

### 10.10 Registers 65 and 66 - Temperature Measurement <br> TEMP_OUT_H and TEMP_OUT_L <br> Type: Read Only

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 41 | 65 | TEMP_OUT[15:8] |  |  |  |  |  |  |  |
| 42 | 66 | TEMP_OUT[7:0] |  |  |  |  |  |  |  |

## Description:

These registers store the most recent temperature sensor measurement.
Temperature measurements are written to these registers at the Sample Rate as defined in Register 25.

These temperature measurement registers, along with the gyroscope measurement registers, are composed of two sets of registers: an internal register set and a user-facing read register set.
The data within the temperature sensor's internal register set is always updated at the Sample Rate. Meanwhile, the user-facing read register set duplicates the internal register set's data values whenever the serial interface is idle. This guarantees that a burst read of sensor registers will read measurements from the same sampling instant. Note that if burst reads are not used, the user is responsible for ensuring a set of single byte reads correspond to a single sampling instant by checking the Data Ready interrupt.
The scale factor and offset for the temperature sensor are found in the Electrical Specifications table in Product Specification document.

## Parameters:

TEMP_OUT
16-bit signed value.
Stores the most recent temperature sensor measurement.

### 10.11 Registers 67 to 72 - Gyroscope Measurements

GYRO_XOUT_H, GYRO_XOUT_L, GYRO_YOUT_H, GYRO_YOUT_L, GYRO_ZOUT_H, and GYRO_ZOUT_L
Type: Read Only

| Register (Hex) | Register (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 43 | 67 | GYRO_XOUT[15:8] |  |  |  |  |  |  |  |
| 44 | 68 | GYRO_XOUT[7:0] |  |  |  |  |  |  |  |
| 45 | 69 | GYRO_YOUT[15:8] |  |  |  |  |  |  |  |
| 46 | 70 | GYRO_YOUT[7:0] |  |  |  |  |  |  |  |
| 47 | 71 | GYRO_ZOUT[15:8] |  |  |  |  |  |  |  |
| 48 | 72 | GYRO_ZOUT[7:0] |  |  |  |  |  |  |  |

## Description:

These registers store the most recent gyroscope measurements. Gyroscope measurements are written to these registers at the Sample Rate as defined in Register 25.
The gyroscope sensor registers continuously update at the user selectable ODR sample rate whenever the serial interface is idle. It is recommended to use burst reads on host interface to guarantee a read of sensor registers will read measurements from the same sampling instant. Note that if burst reads are not used, the user is responsible for ensuring a set of single byte reads correspond to a single sampling instant by checking the Data Ready interrupt. Failing to do so, may result in reading the low and high byte of the same sensor from different samples which could appear as noise peaks to the user for example. The following should be considered for single byte read mode:

1. Data_RDY_INT gets generated any time the sensor registers get updated with the sensor data. The frequency of this interrupt is the same as the ODR which is user selectable. The INT Configurations, INT status register and INT pin can be configured using the user register 37h, 38h and 3Ah.
2. The sensor register outputs are 16 bits ( 2 bytes). Both bytes should be read at the same time in order to get reliable data using burst mode. If a single byte read is used, the host needs to read the bytes back to back after Data_RDY_INT is set to ensure both bytes are from same sample.
3. The sensor registers should be read at a faster rate than the selected ODR with the read cycle preferably completed for all the sensors to get consistent and reliable output.

Each 16-bit gyroscope measurement has a full scale defined in FS_SEL (Register 27). For each full scale setting, the gyroscopes' sensitivity per LSB in GYRO_xOUT is shown in the table below:

| FS_SEL | Full Scale Range | LSB Sensitivity |
| :---: | :---: | :---: |
| 0 | 0 | $\pm 250 \% \mathrm{~s}$ |
| 1 | 1 | $\pm 500 \%$ |
| 2 | 2 | $\pm 1000 \% \mathrm{~s}$ |
| 3 | 3 | $\pm 2000 \% \mathrm{~s}$ |

## Parameters:

GYRO_XOUT 16-bit 2's complement value.
Stores the most recent X axis gyroscope measurement.
GYRO_YOUT 16-bit 2's complement value.
Stores the most recent Y axis gyroscope measurement.
GYRO_ZOUT 16-bit 2's complement value.
Stores the most recent $Z$ axis gyroscope measurement.

IXZ-2510 Product Specification

### 10.12 Register 106 - User Control <br> USER_CTRL <br> Type: Read/Write

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 6 A | 106 | - | FIFO_EN | - | I2C_IF <br> _DIS | - | FIFO <br> RESET | - | SIG_COND <br> _RESET |

## Description:

This register allows the user to enable and disable the FIFO buffer and choose the primary $\mathrm{I}^{2} \mathrm{C}$ interface. The FIFO buffer, sensor signal paths and sensor registers can also be reset using this register.
The primary SPI interface will be enabled in place of the disabled primary $\mathrm{I}^{2} \mathrm{C}$ interface when I2C_IF_DIS is set to 1 .
When the reset bits (FIFO_RESET and SIG_COND_RESET) are set to 1, these reset bits will trigger a reset and then clear to 0 .
Bits 7, 5, 3, and 1 are reserved.

## Parameters:

I2C_IF_DIS When set to 1 , this bit disables the primary $I^{2} \mathrm{C}$ interface and enables the SPI interface instead.
FIFO_RESET This bit resets the FIFO buffer when set to 1. It is recommended that FIFO_EN be 0 when this is done. This bit automatically clears to 0 after the reset has been triggered.
SIG_COND_RESET When set to 1, this bit resets the signal paths for all sensors (gyroscopes and temperature sensor). This operation will also clear the sensor registers. This bit automatically clears to 0 after the reset has been triggered.

### 10.13 Register 107 - Power Management 1 <br> PWR_MGMT_1

Type: Read/Write

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $6 B$ | 107 | DEVICE <br> _RESET | SLEEP | - | - | TEMP_DIS |  | CLKSEL[2:0] |  |

## Description:

This register allows the user to configure the power mode and clock source. It also provides a bit for resetting the entire device, and a bit for disabling the temperature sensor.
By setting SLEEP to 1 , the device can be put into low power sleep mode.
An internal 20 MHz oscillator or the gyroscope based clock (PLL) can be selected as the device clock source. The PLL is the default clock source upon power up. In order for the gyroscope to perform to spec, the PLL must be selected as the clock source.
When the internal 20 MHz oscillator is chosen as the clock source, the device can operate while having the gyroscopes disabled. However, this is only recommended if the user wishes to use the internal temperature sensor in this mode.
The clock source can be selected according to the following table.

| CLKSEL | Clock Source |
| :---: | :--- |
| 0 | Internal 20MHz oscillator |
| 1 | PLL |
| 2 | PLL |
| 3 | PLL |
| 4 | PLL |
| 5 | PLL |
| 6 | Internal 20 MHz oscillator |
| 7 | Reserved |

For further information regarding the device clock source, please refer to the relevant Product Specification document and the Power Mode Transition Descriptions section in the Appendix.

Bits 5 and 4 are reserved.
Parameters:
DEVICE_RESET

SLEEP
TEMP_DIS
CLKSEL
When set to 1, this bit resets all internal registers to their default values.
The bit automatically clears to 0 once the reset is done.
The default values for each register can be found in Section 3.
When set to 1 , this bit puts the device into sleep mode.
When set to 1 , this bit disables the temperature sensor.
3 -bit unsigned value. Specifies the clock source of the device.

### 10.14 Register 108 - Power Management 2 <br> PWR_MGMT_2

Type: Read/Write

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 6C | 108 | - | - | - | - | - | STBY_XG | STBY_YG | STBY_ZG |

## Description:

This register allows the user to put individual axes of the gyroscope into standby mode. Note that in order to activate any gyro axis again, all gyro axes must first be put into standby mode, and then be turned on simultaneously.
If the user wishes to put all three gyro axes into standby mode, the internal oscillator must be selected as the clock source (Register 107).
If all three gyro axes are put into standby mode while the clock source of the device is set to the PLL (with the gyro drive generating the reference clock), the chip will hang due to an absence of a clock. As long as one gyro axis is enabled, the drive circuit will remain active and the PLL will provide a clock.
Bits 7 through 3 are reserved.
Parameters:
STBY_XG

STBY_YG When set to 1 , this bit puts the $Y$ axis gyroscope into standby mode.
When cleared to 0 after all three gyro axes have been but into standby mode, the gyroscope turns on.
STBY_ZG When set to 1 , this bit puts the $Z$ axis gyroscope into standby mode. When cleared to 0 after all three gyro axes have been but into standby mode, the gyroscope turns on.

### 10.15 Register 114 and 115 - FIFO Count Registers

FIFO_COUNT_H and FIFO_COUNT_L Type: Read Ōnly

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 72 | 114 | - | - | - | - | - | - | FIFO_COUNT[9:8] |  |
| 73 | 115 | FIFO_COUNT[7:0] |  |  |  |  |  |  |  |

## Description:

These registers keep track of the number of samples currently in the FIFO buffer in terms of the number of bytes stored.
These registers shadow the FIFO Count value. Both registers are loaded with the current sample count when FIFO_COUNT_H (Register 114) is read.
Note: Reading only FIFO_COUNT_L will not update the registers to the current FIFO COUNT value. FIFO_COUNT_H must be accessed first to update the contents of both these registers.
FIFO_COUNT should always be read in high-low order in order to guarantee that the most current FIFO Count value is read.
Bits 7 through 2 of Register 114 are reserved.

## Parameters:

FIFO_COUNT
16-bit unsigned value. Indicates the number of bytes stored in the FIFO buffer. This number is in turn the number of bytes that can be read from the FIFO buffer and it is directly proportional to the number of samples available given the set of sensor data bound to be stored in the FIFO (register 35).

| MMQMS日MS日 | IXZ-2510 Product Specification | Document Number: PS-IXZ-2510A-00 <br> Revision: 1.1 <br> Release Date: $9 / 23 / 2016$ |
| :--- | :--- | :--- | :--- |

### 10.16 Register 116 - FIFO Read Write

FIFO_R_W
Type: Read/Write

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | Bit0 | 74 | 116 | FIFO_DATA[7:0] |
| :---: | :---: | :---: | :---: | :---: |

## Description:

This register is used to read and write data from the FIFO buffer.
Data is written to the FIFO in order of register number (from lowest to highest). If all the FIFO enable flags (see below) are enabled, the contents of registers 65 through 72 will be written in order at the Sample Rate, based on the description for SMPLRT_DIV, located in Register 25.
The contents of the sensor data registers (Registers 65 to 72) are written into the FIFO buffer when their corresponding FIFO enable flags are set to 1 in FIFO_EN (Register 35).
If the FIFO buffer has overflowed, the status bit FIFO_OFLOW_INT is automatically set to 1. This bit is located in INT_STATUS (Register 58). When the FIFO buffer has overflowed, the treatment of the new data is determined by the FIFO_MODE bit in Register 26.
The user should check FIFO_COUNT to ensure that the FIFO buffer is not read when empty, and that more data than available is not read from the FIFO.

## Parameters:

FIFO_DATA 8-bit data transferred to and from the FIFO buffer.

| /IVQПSEMSE | IXZ-2510 Product Specification | Document Number: PS-IXZ-2510A-00 <br> Revision: 1.1 <br> Release Date: $9 / 23 / 2016$ |

### 10.17 Register 117 - Who Am I

WHO_AM_I
Type: Read Only

| Register <br> (Hex) | Register <br> (Decimal) | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 75 | 117 | - | WHO_AM_[5:0] |  |  |  |  |  | - |

## Description:

This register is used to verify the identity of the device. The contents of WHO_AM_I are the upper 6 bits of the device's 7 -bit $I^{2} \mathrm{C}$ address. The least significant bit of the IT devices's $I^{2} \mathrm{C}$ address is determined by the value of the AD0 pin. The value of the AD0 pin is not reflected in this register.
The default value of the register is $0 \times 68$.
Bits 0 and 7 are reserved. (Hard coded to 0)
Parameters:
WHO_AM_I Contains the 6-bit I ${ }^{2} \mathrm{C}$ address of the gyroscope device The Power-On-Reset value of Bit6:Bit1 is 110100.

## 11 Environmental Compliance <br> The IXZ-2510 is RoHS Green and environmental compliant.
