ISOCOM
COMPONENTS

ICPL0600 / ICPL0601 / ICPL0611

DESCRIPTION

The ICPL0600, ICPL0601 and ICPL0611 devices each consist of an infrared emitting diode, optically coupled to a high speed integrated photo detector logic gate with a strobable output.

These devices belong to Isocom Compact Range of Optocouplers.

FEATURES

- Half Pitch 1.27mm
- High Speed 10Mbit/s
- 10kV/µs min. Common Mode Transient Immunity (ICPL0611)
- High AC Isolation voltage 3750V_{RMS}
- Guaranteed Performance from -40°C to 85°C
- Wide Operating Temperature Range -40°C to 100°C
- Logic Gate Output
- Pb Free and RoHS Compliant
- Halogen Free
- Safety Approvals Pending

APPLICATIONS

- Line Receivers, Data Communication
- LSTTL to TTL, LSTTL or 5V CMOS
- Data Multiplexing
- Pulse Transformer Replacement
- Switch Mode Power Supplies
- Ground Loop Elimination
- Computer Peripheral Interface

ORDER INFORMATION

- Add T&R after PN for Surface Mount Tape & Reel
1. No Connection
2. Anode
3. Cathode
4. No Connection
5. Gnd
6. Vout
7. V_E
8. V_{CC}

A 0.1µF bypass capacitor must be connected between pins 8 and 5.

ABSOLUTE MAXIMUM RATINGS (T_A = 25°C)

Input Diode

Forward Current	20mA
Reverse Voltage	5V
Power dissipation	40mW

Output

Output Current	50mA
Output Voltage	7.0V
Supply Voltage	7.0V
Enable Input Voltage	5.5V
(maximum 500mV above V_{CC})	
Enable Input Current	5mA
Power Dissipation	85mW

Total Package

Isolation Voltage	3750V_{RMS}
Operating Temperature	-40 to 100 °C
Storage Temperature	-55 to 125 °C
Lead Soldering Temperature (10s)	260°C

ISOCOM

Fig 15 High Common Mode Transient Immunity Test Circuit

Common mode transient immunity in logic high level is the maximum tolerable (positive) dV_{CM}/dt on the leading edge of the common mode pulse signal V_{CM}, to assure that the output will remain in a logic high state (i.e., $V_O > 2.0V$).

Common mode transient immunity in logic low level is the maximum tolerable (negative) dV_{CM}/dt on the trailing edge of the common mode pulse signal, V_{CM}, to assure that the output will remain in a logic low state (i.e., $V_O < 0.8V$).

Notes:

- The V_{CC} supply must be bypassed by a 0.1µF capacitor or larger with good high frequency characteristic and should be connected as close as possible to the package V_{CC} and GND pins.

- Enable Input – No pull up resistor required as the device has an internal pull up resistor.

- t_{PLH} is measured from the 3.75mA level on the HIGH to LOW transition of the input current pulse to the 1.5 V level on the LOW to HIGH transition of the output voltage pulse.

- t_{PHL} is measured from the 3.75mA level on the LOW to HIGH transition of the input current pulse to the 1.5 V level on the HIGH to LOW transition of the output voltage pulse.

- t_r Rise time is measured from the 10% to the 90% levels on the LOW to HIGH transition of the output pulse.

- t_f Fall time is measured from the 90% to the 10% levels on the HIGH to LOW transition of the output pulse.

- t_{ELH} is measured from the 1.5V level on the HIGH to LOW transition of the input Enable voltage pulse to the 1.5V level on the LOW to HIGH transition of the output voltage pulse.

- t_{EHL} is measured from the 1.5V level on the LOW to HIGH transition of the input Enable voltage pulse to the 1.5V level on the HIGH to LOW transition of the output voltage pulse.

- CM_H– The maximum tolerable rate of rise of the common mode voltage to ensure the output will remain in the HIGH state (i.e., $V_O > 2.0V$).

- CM_L– The maximum tolerable rate of rise of the common mode voltage to ensure the output will remain in the LOW output state (i.e., $V_O < 0.8V$).
