## GENERAL DESCRIPTION

The IS31FL3741A is a general purpose $39 \times 9$ LED Matrix programmed via an I2C compatible interface. Each LED can be dimmed individually with 8-bit PWM data and 8-bit scaling data which allowing 256 steps of linear PWM dimming and 256 steps of DC current adjustable level.
Additionally each LED open and short state can be detected, IS31FL3741A store the open or short information in Open-Short Registers. The Open-Short Registers allowing MCU to read out via I2C compatible interface. Inform MCU whether there are LEDs open or short and the locations of open or short LEDs.

The IS31FL3741A operates from 2.7 V to 5.5 V and features a very low shutdown and operational current.

IS31FL3741A is available in QFN-60 ( $7 \mathrm{~mm} \times 7 \mathrm{~mm}$ ) package. It operates from 2.7 V to 5.5 V over the temperature range of $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$.

## FEATURES

- Supply voltage range: $2.7 \mathrm{~V} \sim 5.5 \mathrm{~V}$
- 39 Current Sink $\times 9$ SW matrix size: drive up to 351 LEDs or 117 RGBs
- Individual 256 PWM control steps
- Individual 256 DC current steps
- Global 255 current setting
- SDB rising edge reset I2C module
- Programmable H/L logic: $1.4 \mathrm{~V} / 0.4 \mathrm{~V}, 2.4 \mathrm{~V} / 0.6 \mathrm{~V}$
- $29 \mathrm{kHz} / 3.6 \mathrm{kHz} / 1.8 \mathrm{kHz} / 900 \mathrm{~Hz}$ PWM frequency
- 1 MHz I2C-compatible interface
- interrupt and state lookup registers
- Individual open and short error detect function
- De-ghost
- QFN-60 ( $7 \mathrm{~mm} \times 7 \mathrm{~mm}$ ) package

## APPLICATIONS

- Hand-held devices for LED display
- Gaming device (Keyboard, Mouse etc.)
- LED in white goods application
- Music box

TYPICAL APPLICATION CIRCUIT

Figure 1 Typical Application Circuit (Single Color: 39×9)

TYPICAL APPLICATION CIRCUIT (CONTINUED)

Figure 2 Typical Application Circuit (RGB Color: 13×9)
Note 1: The IC and LED should be placed far away from any local antenna in order to prevent EMI contamination.

PIN CONFIGURATION

PIN DESCRIPTION

| No. | Pin | Description |
| :--- | :--- | :--- |
| $1 \sim 6,26 \sim 35,37$ <br> $\sim 54,56 \sim 60$ | CS1~CS39 | Current sink pin for LED matrix. |
| 7 | INTB | Interrupt output pin. Register FOh sets the function of the <br> INTB pin and active low when the interrupt event <br> happens. Can be NC (float) if interrupt function no used. |
| 8 | ADDR | I2C address select pin. |
| 9 | SDA | I2C compatible serial data. |
| 10 | SCL | I2C compatible serial clock. |
| 11 | SDB | Shutdown pin. |
| $12,36,55$ | GND | Power GND (36, 55) and analog GND pin (12). |
| 13 | ISET | lout setting register. |
| 14 | AVCC | Power for analog and digital circuits. |
| 15,25 | PVCC | Power for current source. |
| $16 \sim 24$ | SW1~SW9 | Source/switch pin for LED matrix. |
|  | Thermal Pad | Need to connect to GND pins in PCB. |

## ABSOLUTE MAXIMUM RATINGS

| Supply voltage, $\mathrm{V}_{\mathrm{CC}}$ | $-0.3 \mathrm{~V} \sim+6.0 \mathrm{~V}$ |
| :--- | :--- |
| Voltage at any input pin | $-0.3 \mathrm{~V} \sim \mathrm{~V}_{\mathrm{CC}}+0.3 \mathrm{~V}$ |
| Maximum junction temperature, $\mathrm{T}_{\mathrm{JMAX}}$ | $+150^{\circ} \mathrm{C}$ |
| Storage temperature range, $\mathrm{T}_{\mathrm{STG}}$ | $-65^{\circ} \mathrm{C} \sim+150^{\circ} \mathrm{C}$ |
| Operating temperature range, $\mathrm{T}_{\mathrm{A}}=\mathrm{T}_{\mathrm{J}}$ | $-40^{\circ} \mathrm{C} \sim+125^{\circ} \mathrm{C}$ |
| Package thermal resistance, junction to ambient (4 layer standard <br> test PCB based on JESD $51-2 \mathrm{~A}), \theta_{\mathrm{JA}}$ | $33.1^{\circ} \mathrm{C} / \mathrm{W}$ |
| ESD (HBM) | $\pm 2 \mathrm{kV}$ |
| ESD (CDM) | $\pm 750 \mathrm{~V}$ |

Note 2: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS
The following specifications apply for $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, unless otherwise noted.

| Symbol | Parameter | Conditions | Min. | Typ. | Max. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{CC}}$ | Supply voltage |  | 2.7 |  | 5.5 | V |
| $I_{\text {cc }}$ | Quiescent power supply current | $\begin{aligned} & \mathrm{R}_{\text {ISET }}=10 \mathrm{k} \Omega, \mathrm{GCC}=0 \times F F, \\ & \mathrm{Scaling}=0 \times F F, \mathrm{PWM}=0 \times 00, \\ & \mathrm{~V}_{\mathrm{cc}}=3.6 \mathrm{~V} \end{aligned}$ |  | 3.6 | 4.5 | mA |
|  |  | $\begin{aligned} & \mathrm{R}_{\text {ISET }}=10 \mathrm{k} \Omega, \mathrm{GCC}=0 \mathrm{xFF}, \\ & \mathrm{Scaling}=0 \mathrm{xFF}, \mathrm{PWM}=0 \times 00, \mathrm{~V}_{\mathrm{CC}}= \\ & 5 \mathrm{~V} \end{aligned}$ |  | 4.0 | 5.5 |  |
| $I_{\text {SD }}$ | Shutdown current | $\mathrm{V}_{\text {SDB }}=0 \mathrm{~V}$ |  | 0.5 | 1 | $\mu \mathrm{A}$ |
|  |  | $R_{\text {ISET }}=10 \mathrm{k} \Omega, \mathrm{V}_{\text {SDB }}=0 \mathrm{~V}$ or software shutdown, $\mathrm{V}_{\mathrm{Cc}}=3.6 \mathrm{~V}$ |  | 0.5 | 1 |  |
|  |  | $R_{\text {ISET }}=10 \mathrm{k} \Omega, \mathrm{V}_{\text {SDB }}=0 \mathrm{~V}$ or software shutdown, $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}$ |  | 1 | 3 |  |
| lout | Maximum constant current of CS1~CS39 | $\begin{aligned} & \mathrm{R}_{\text {ISET }}=10 \mathrm{k} \Omega, \mathrm{GCC}=0 \times \mathrm{FF}, \\ & \text { Scaling }=0 \mathrm{xFF} \end{aligned}$ | 34.96 | 38 | 41.04 | mA |
| $\mathrm{I}_{\text {LED }}$ | Average current on each LED $I_{\text {LED }}=I_{\text {OUT }} / 10.125$ | $\begin{aligned} & \mathrm{R}_{\text {ISET }}=10 \mathrm{k} \Omega, \mathrm{GCC}=0 \times \mathrm{FF}, \\ & \text { Scaling }=0 \mathrm{xFF} \end{aligned}$ | 3.45 | 3.75 | 4.05 | mA |
| $\Delta \mathrm{l}_{\text {MAT }}$ | Channel mismatch | $\begin{aligned} & \mathrm{R}_{\text {ISET }}=10 \mathrm{k} \Omega, \mathrm{GCC}=0 \times \mathrm{FF} \text {, } \\ & \text { Scaling }=0 \mathrm{xFF} \end{aligned}$ | -6 |  | 6 | \% |
| $V_{H R}$ | Current switch headroom voltage SW1~SW9 | $\mathrm{I}_{\text {SWITCH }}=800 \mathrm{~mA}($ Note 3, 4) |  | 550 | 750 | mV |
|  | Current sink headroom voltage CS1~CS39 | $\mathrm{I}_{\text {SINK }}=38 \mathrm{~mA}$ ( Note 3) |  | 350 | 600 |  |
| $t_{\text {SCAN }}$ | Period of scanning | PFS = "0000" 29 kHz ) | 28 | 32 | 37 | $\mu \mathrm{s}$ |
|  |  | PFS $=$ "0011"(3.6kHz) | 224 | 256 | 296 |  |
|  |  | PFS= "0111" (1.8kHz) | 448 | 512 | 592 |  |
| $\mathrm{t}_{\text {NOL1 }}$ | Non-overlap blanking time during scan, the SWx and CSy are all off during this time | PFS= "0000"(29kHz) | 1.75 | 2 | 2.32 | $\mu \mathrm{s}$ |
|  |  | PFS $=$ "0011"(3.6kHz) | 14 | 16 | 18.5 |  |
|  |  | PFS= "0111" (1.8kHz) | 28 | 32 | 37 |  |
| $\mathrm{t}_{\mathrm{NOL} 2}$ | Delay total time for CS1 to CS39, during this time, the SWx is on but CSx is not all turned on | PFS= "0000"(29kHz) | 1.75 | 2 | 2.32 | $\mu \mathrm{s}$ |
|  |  | PFS = "0011"(3.6kHz) | 14 | 16 | 18.5 |  |
|  |  | PFS= "0111" (1.8kHz) | 28 | 32 | 37 |  |

ELECTRICAL CHARACTERISTICS (CONTINUED)
The following specifications apply for $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, unless otherwise noted.

| Symbol | Parameter | Conditions | Min. | Typ. | Max. | Unit |

| $\mathrm{t}_{\mathrm{F}}$ | Fall time of both SDA and SCL signals, receiving | - |  | 300 | - |  | 120 | ns |

Note 3: Global Current Control Register (GCC, PG4, 01h) written "1111 1111", Scaling written "1111 1111", RISET $=10 \mathrm{k} \Omega$.
Note 4: All LEDs PWM= 0xFF, GCC= 0xFF.
Note 5: Guaranteed by design.

## DETAILED DESCRIPTION

## I2C INTERFACE

The IS31FL3741A uses a serial bus, which conforms to the I2C protocol, to control the chip's functions with two wires: SCL and SDA. The IS31FL3741A has a 7bit slave address (A7:A1), followed by the R/W bit, A0. Set $A 0$ to " 0 " for a write command and set $A 0$ to " 1 " for a read command. The value of bits A1 and A2 are decided by the connection of the ADDR pin.
Table 1 Slave Address

| Bit | A7:A3 | A2:A1 | A0 |
| :---: | :---: | :---: | :---: |
| Value | 01100 | ADDR | $0 / 1$ |

ADDR connects to GND, ADDR= 00;
ADDR connects to VCC, ADDR=11;
ADDR connects to SCL, ADDR=01;
ADDR connects to SDA, ADDR=10;
The SCL line is uni-directional. The SDA line is bidirectional (open-drain) with a pull-up resistor (typically 400 kHz IIC with $4.7 \mathrm{k} \Omega, 1 \mathrm{MHz}$ IIC with $1 \mathrm{k} \Omega$ ). The maximum clock frequency specified by the I2C standard is 1 MHz . In this discussion, the master is the microcontroller and the slave is the IS31FL3741A.

The timing diagram for the I2C is shown in Figure 3. The SDA is latched in on the stable high level of the SCL. When there is no interface activity, the SDA line should be held high.

The "START" signal is generated by lowering the SDA signal while the SCL signal is high. The start signal will alert all devices attached to the I2C bus to check the incoming address against their own chip address.

The 8-bit chip address is sent next, most significant bit first. Each address bit must be stable while the SCL level is high.

After the last bit of the chip address is sent, the master checks for the IS31FL3741A's acknowledge. The master releases the SDA line high (through a pull-up resistor). Then the master sends an SCL pulse. If the IS31FL3741A has received the address correctly, then it holds the SDA line low during the SCL pulse. If the SDA line is not low, then the master should send a "STOP" signal (discussed later) and abort the transfer.

Following acknowledge of IS31FL3741A, the register address byte is sent, most significant bit first. IS31FL3741A must generate another acknowledge indicating that the register address has been received.

Then 8-bit of data byte are sent next, most significant bit first. Each data bit should be valid while the SCL level is stable high. After the data byte is sent, the IS31FL3741A must generate another acknowledge to indicate that the data was received.
The "STOP" signal ends the transfer. To signal "STOP", the SDA signal goes high while the SCL signal is high.

## ADDRESS AUTO INCREMENT

To write multiple bytes of data into IS31FL3741A, load the address of the data register that the first data byte is intended for. During the IS31FL3741A acknowledge of receiving the data byte, the internal address pointer will increment by one. The next data byte sent to IS31FL3741A will be placed in the new address, and so on. The auto increment of the address will continue as long as data continues to be written to IS31FL3741A (Figure 6).

## READING OPERATION

Most of the registers can be read.
To read the FCh, FEh, F0h and F1h, after I2C start condition, the bus master must send the IS31FL3741A device address with the R/W bit set to " 0 ", followed by the register address (FEh or F1h) which determines which register is accessed. Then restart I2C, the bus master should send the IS31FL3741A device address with the R/W bit set to " 1 ". Data from the register defined by the command byte is then sent from the IS31FL3741A to the master (Figure 7).

To read the registers of Page 0 thru Page 5, the FDh should write with 00 h before follow the Figure 7 sequence to read the data. That means, when you want to read register of Page 0, the FDh should point to Page 0 first and you can read the Page 0 data.

Figure 3 Interface Timing

Figure 6 Writing to IS31FL3741A (Automatic address increment)

Figure 7 Reading from IS31FL3741A

Table 2 Register Definition-1

| Address | Name | Function | Table | R/W | Default |
| :---: | :--- | :--- | :---: | :---: | :---: |
| FDh | Command Register | Available Page 0 to Page 4 registers | 3 | W | 00000000 |
| FEh | Command Register Write Lock | To lock/unlock Command Register | 4 | R/W |  |
| F0h | Interrupt Mask Register | Configure the interrupt function | 5 | W | 00000000 |
| F1h | Interrupt Status Register | Show the interrupt status | 6 | R |  |
| FCh | ID Register | For read the product ID only | - | R | Slave <br> Address |

## REGISTER CONTROL

Table 3 FDh Command Register (Write Only)

| Data | Function |
| :---: | :--- |
| 00000000 | Point to Page 0 (PG0, PWM Register 1 is available) |
| 00000001 | Point to Page 1 (PG1, PWM Register 2 is available) |
| 00000010 | Point to Page 2 (PG2, Scaling Register 1 is available) |
| 00000011 | Point to Page 3 (PG3, Scaling Register 2 is available) |
| 00000100 | Point to Page 4 (PG4, Function Register is available) |
| Others | Not allowed |

Note: FDh is locked when power up, need to unlock this register before write command to it. See Table 4 for detail.
The Command Register should be configured first after writing in the slave address to choose the available register. Then write data in the choosing register. Power up default state is "0000 0000".
For example, when write "0000 0010" in the Command Register (FDh), the data which writing after will be stored in the page 2 Registers. Write new data can configure other frame position.

Table 4 FEh Command Register Write Lock (Read/Write)

| Bit | D7:D0 |
| :---: | :---: |
| Name | CRWL |
| Default | 00000000 |

To select the PG0~PG4, need to unlock this register first, with the purpose to avoid mis-operation of this register. When FEh is written with "1100 0101", FDh is allowed to modify once, after the FDh is modified the FEh will reset to be "0000 0000" at once.

| CRWL | Command Register Write Lock |
| :--- | :--- |
| 00000000 | FDh write disable |
| 11000101 | FDh write enable once |

Table 5 FOh Interrupt Mask Register (Write Only)

| Bit | D7:D5 | D4 | D3:D2 | D1 | D0 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | IAC | - | IS | IO |
| Default | 000 | 0 | 00 | 0 | 0 |

Configure the interrupt function for IC.

## IAC Auto Clear Interrupt Bit

$0 \quad$ Interrupt could not auto clear
1 Interrupt auto clear when INTB stay low exceeds 8 ms

IS Dot Short Interrupt Bit
0 Disable dot short interrupt
1 Enable dot short interrupt
IO Dot Open Interrupt Bit
0 Disable dot open interrupt
1 Enable dot open interrupt

Table 6 F1h Interrupt Status Register (Read Only)

| Bit | D7:D2 | D1 | D0 |
| :---: | :---: | :---: | :---: |
| Name | - | SB | OB |
| Default | 000000 | 0 | 0 |

Show the interrupt status for IC.
SB Short Bit
$0 \quad$ No short
1 Short happens
OB Open Bit
$0 \quad$ No open
1 Open happens

## FCh ID Register

ID register is read only and read result is the device slave address. For example, if ADDR pin connects to GND, read result is $0 \times 60$.

Table 7 Register Definition-2

| Address | Name | Function | Table | R/W | Default |
| :---: | :---: | :---: | :---: | :---: | :---: |
| PG0 (0x00): PWM Register 1 |  |  |  |  |  |

| 03h~2Fh | Open/Short Register | Store the open or short information | 14 | R | 00000000 |
| 36h | PWM frequency setting register | PWM frequency setting register | 15 | R/W | 00000000 |
| 3Fh | Reset Register | Reset all register to POR state | - | W | 00000000 |

Page $0 / 1$ (PG0/PG1, FDh= 0x00/0x01): PWM Register 1/2

Figure 8 PWM Register

Table 8
PG0: 00h ~ B3h PWM Register
PG1: 00h ~ AAh PWM Register

| Bit | D7:D0 |
| :---: | :---: |
| Name | PWM |
| Default | 00000000 |

Each dot has a byte to modulate the PWM duty in 256 steps.
The value of the PWM Registers decides the average current of each LED noted $\mathrm{I}_{\text {LED }}$.
I LED computed by Formula (1):

$$
\begin{gather*}
I_{L E D}=\frac{P W M}{256} \times I_{\text {OUT }(\text { PEAK })} \times \text { Duty }  \tag{1}\\
P W M=\sum_{n=0}^{7} D[n] \cdot 2^{n}
\end{gather*}
$$

Where Duty is the duty cycle of SWx ,

$$
\begin{equation*}
\text { Duty }=\frac{32 \mu s}{(32 \mu s+2 \mu s+2 \mu s)} \times \frac{1}{9}=\frac{1}{10.125} \tag{2}
\end{equation*}
$$

lout $_{\text {Is }}$ the output current of $C S y(y=1 \sim 39)$,

$$
\begin{equation*}
I_{\text {OUTPEAK) }}=\frac{383}{R_{I S E T}} \times \frac{G C C}{256} \times \frac{S L}{256} \tag{3}
\end{equation*}
$$

GCC is the Global Current Control register (PG4, 01 h ) value, SL is the Scaling Register value as Table 9 and $\mathrm{R}_{\text {ISET }}$ is the external resistor of ISET pin. $\mathrm{D}[\mathrm{n}]$ stands for the individual bit value, 1 or 0 , in location n.

For example: if D7:D0=1011 0101 (0xB5, 181), $G C C=1111$ 1111, $\mathrm{R}_{\text {ISET }}=10 \mathrm{k} \Omega, \mathrm{SL}=1111$ 1111:
$I_{\text {LED }}=\frac{383}{10 k \Omega} \times \frac{255}{256} \times \frac{255}{256} \times \frac{1}{10.125} \times \frac{181}{256}=2.54 \mathrm{~mA}$

Page 2/3 (PG2/PG3, FDh= 0x02/0x03): Scaling Register 1/2

Figure 9 Scaling Register

Table 9
PG2: 00h ~ B3h Scaling Register PG3: 00h ~ AAh Scaling Register

| Bit | D7:D0 |
| :---: | :---: |
| Name | SL |
| Default | 00000000 |

Scaling register control the DC output current of each dot. Each dot has a byte to modulate the scaling in 256 steps.
The value of the Scaling Register decides the peak current of each LED noted $\mathrm{l}_{\text {Out }}$.
lout computed by Formula (3):

$$
\begin{align*}
& I_{\text {OUT(PEAK) }}= \frac{383}{R_{\text {ISET }}} \times \frac{G C C}{256} \times \frac{S L}{256}  \tag{3}\\
& \mathrm{~S} L=\sum_{n=0}^{7} D[n] \cdot 2^{n}
\end{align*}
$$

I lout is the output current of CSy ( $\mathrm{y}=1 \sim 39$ ), GCC is the Global Current Control Register (PG4, 01h) value and $R_{\text {ISET }}$ is the external resistor of $R_{\text {ISET }}$ pin. $D[n]$ stands for the individual bit value, 1 or 0 , in location n .

For example: if $R_{\text {ISET }}=10 \mathrm{k} \Omega, \quad \mathrm{GCC}=1111$ 1111, SL=0111 1111:

$$
\begin{gathered}
\mathrm{S} L=\sum_{n=0}^{7} D[n] \cdot 2^{n}=127 \\
I_{\text {OUT }}=\frac{383}{10 k \Omega} \times \frac{255}{256} \times \frac{127}{256}=18.93 \mathrm{~mA} \\
I_{\text {LED }}=18.93 \mathrm{~mA} \times \frac{1}{10.125} \times \frac{P W M}{256}
\end{gathered}
$$

Table 11 00h Configuration Register

| Bit | D7:D4 | D3 | D2:D1 | D0 |
| :---: | :---: | :---: | :---: | :---: |
| Name | SWS | LGC | OSDE | SSD |
| Default | 0000 | 0 | 00 | 0 |

The Configuration Register sets operating mode of IS31FL3741A.

SSD Software Shutdown Control
0 Software shutdown
1 Normal operation
OSDE Open Short Detection Enable
00 Disable open/short detection
01/11 Enable open detection
10 Enable short detection

LGC H/L Logic
$0 \quad 1.4 \mathrm{~V} / 0.4 \mathrm{~V}$
$1 \quad 2.4 \mathrm{~V} / 0.6 \mathrm{~V}$

SWS SWx Setting
0000 n=9, SW1~SW9, 1/9
0001 n=8, SW1~SW8, 1/8, SW9 no-active
0010 n=7, SW1~SW7, 1/7, SW8~SW9 no-active
0011 n=6, SW1~SW6, 1/6, SW7~SW9 no-active
0100 n=5, SW1~SW5, 1/5, SW6~SW9 no-active
0101 n=4, SW1~SW4, 1/4, SW5~SW9 no-active
0110 n=3, SW1~SW3, 1/3, SW4~SW9 no-active
0111 n=2, SW1~SW2, 1/2, SW3~SW9 no-active
1000 All CSx work as current sinks only, no scan
Others 1/9

When OSDE set to "01", open detection will be trigger once, the user could trigger open detection again by set OSDE from "00" to "01".
When OSDE set "10", short detection will be trigger once, the user could trigger short detection again by set OSDE from " 00 " to " 10 ".
When SSD is " 0 ", IS31FL3741A works in software shutdown mode and to normal operate the SSD bit should set to " 1 ".
SWS control the duty cycle of the SW, default mode is 1/9.

Table 12 01h Global Current Control Register

| Bit | D7:D0 |
| :---: | :---: |
| Name | GCC |
| Default | 00000000 |

The Global Current Control Register modulates all CSy ( $x=1 \sim 39$ ) DC current which is noted as $l_{\text {OUT }}$ in 256 steps.
lout $_{\text {Is }}$ is computed by the Formula (3):

$$
\begin{array}{r}
I_{\text {OUTPEAK) }}=\frac{383}{R_{I S E T}} \times \frac{G C C}{256} \times \frac{S L}{256}  \tag{3}\\
G C C=\sum_{n=0}^{7} D[n] \cdot 2^{n}
\end{array}
$$

Where $\mathrm{D}[\mathrm{n}]$ stands for the individual bit value, 1 or 0 , in location $n$.

Table 13 02h Pull Down/Up Resistor Selection Register

When OSDE (PG4, 00h) is set to " 01 ", open detection will be trigger once, and the open information will be stored at 03h~2Fh.
When OSDE (PG4, 00h) set to " 10 ", short detection will be trigger once, and the short information will be stored at 03h~2Fh.
Before set OSDE, the GCC should set to $0 \times 01$.

Figure 10 Open/Short Register

Table 15 36h PWM Frequency Setting Register

| Bit | D7:D4 | D3:D0 |
| :---: | :---: | :---: |
| Name | - | PFS |
| Default | 0000 | 0000 |

The PFS bits selects a fixed PWM operating frequency for all CSx, when PFS set "0000", the PWM frequency is 29 kHz , when PFS set to "1011", the PWM frequency is 900 Hz .

PFS PWM Frequency Setting
0000 29kHz(default)
0011 3.6kHz
0111 1.8kHz
1011900 Hz

## 3Fh Reset Register

Once user writes the Reset Register with OxAE, IS31FL3741A will reset all the IS31FL3741A registers to their default value. On initial power-up, the IS31FL3741A registers are reset to their default values for a blank display.

## APPLICATION INFORMATION

Figure 11 Scanning Timing

## SCANING TIMING

As shown in Figure 11, the SW1~SW9 is turned on by serial, LED is driven 9 by 9 within the SWx ( $x=1 \sim 9$ ) on time (SWx, $x=1 \sim 9$ ) is sink and pull low when LED on), including the non-overlap blanking time during scan, the duty cycle of $S W x$ (active low, $x=1 \sim 9$ ) is:

$$
\begin{equation*}
\text { Duty }=\frac{32 \mu s}{(32 \mu s+2 \mu s+2 \mu s)} \times \frac{1}{9}=\frac{1}{10.125} \tag{2}
\end{equation*}
$$

Where $32 \mu \mathrm{~s}$ is $\mathrm{t}_{\text {scan }}$, the period of scanning and $2 \mu \mathrm{~s}$ is $t_{\text {NOL1 }}$ and $t_{\text {NOL2 }}$, the non-overlap time and CSx delay time.

When PFS="0011" or others, the duty result is same.

## PWM CONTROL

After setting the $\mathrm{l}_{\text {Out }}$ and GCC, the brightness of each LEDs (LED average current (lied)) can be modulated with 256 steps by PWM Register, as described in Formula (1).

$$
\begin{equation*}
I_{L E D}=\frac{P W M}{256} \times I_{\text {OUT (PEAK ) }} \times \text { Duty } \tag{1}
\end{equation*}
$$

Where PWM is PWM Registers (PG0, 00h~B3h /PG1, 00h~AAh) data showing in Table 8.
For example, in Figure 1, if $R_{\mid S E T}=10 \mathrm{k} \Omega, \mathrm{PWM}=255$, and GCC $=255$, Scaling $=255$, then

$$
\begin{gathered}
I_{\text {OUT (PEAK ) }}=\frac{383}{10 \mathrm{k} \Omega} \times \frac{255}{256} \times \frac{255}{256}=38 \mathrm{~mA} \\
I_{L E D}=38 \mathrm{~mA} \times \frac{1}{10.125} \times \frac{P W M}{256}
\end{gathered}
$$

Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve a breathing effect.

## GAMMA CORRECTION

In order to perform a better visual LED breathing effect we recommend using a gamma corrected PWM value to set the LED intensity. This results in a reduced number of steps for the LED intensity setting, but causes the change in intensity to appear more linear to the human eye.

Gamma correction, also known as gamma compression or encoding, is used to encode linear luminance to match the non-linear characteristics of display. Since the IS31FL3741A can modulate the brightness of the LEDs with 256 steps, a gamma correction function can be applied when computing each subsequent LED intensity setting such that the changes in brightness matches the human eye's brightness curve.

Table 1632 Gamma Steps with 256 PWM Steps

| $\mathrm{C}(0)$ | $\mathrm{C}(1)$ | $\mathrm{C}(2)$ | $\mathrm{C}(3)$ | $\mathrm{C}(4)$ | $\mathrm{C}(5)$ | $\mathrm{C}(6)$ | $\mathrm{C}(7)$ |

| 161 | 173 | 186 | 199 | 212 | 226 | 240 | 255 |

Figure 12 Gamma Correction (32 Steps)
Choosing more gamma steps provides for a more continuous looking breathing effect. This is useful for very long breathing cycles. The recommended configuration is defined by the breath cycle T. When $\mathrm{T}=1 \mathrm{~s}$, choose 32 gamma steps, when $\mathrm{T}=2 \mathrm{~s}$, choose 64 gamma steps. The user must decide the final number of gamma steps not only by the LED itself, but also based on the visual performance of the finished product.
Table 1764 Gamma Steps with 256 PWM Steps

| $\mathrm{C}(0)$ | $\mathrm{C}(1)$ | $\mathrm{C}(2)$ | $\mathrm{C}(3)$ | $\mathrm{C}(4)$ | $\mathrm{C}(5)$ | $\mathrm{C}(6)$ | $\mathrm{C}(7)$ |

Figure 13 Gamma Correction (64 Steps)
Note: The data of 32 gamma steps is the standard value and the data of 64 gamma steps is the recommended value.

## OPERATING MODE

## PWM Mode

IS31FL3741Acan only operate in PWM Mode. The brightness of each LED can be modulated with 256 steps by PWM registers. For example, if the data in PWM Register is "0000 0100", then the PWM is the fourth step.
Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve a breathing effect.

## De-Ghost Function

The "ghost" term is used to describe the behavior of an LED that should be OFF but instead glows dimly when another LED is turned ON. A ghosting effect typically can occur when multiplexing LEDs. In matrix architecture any parasitic capacitance found in the constant-current outputs or the PCB traces to the LEDs may provide sufficient current to dimly light an LED to create a ghosting effect.

To prevent this LED ghost effect, the IS31FL3741A has integrated Pull down resistors for each SWx ( $\mathrm{x}=1 \sim 9$ ) and Pull up resistors for each CSy ( $\mathrm{y}=1 \sim 39$ ). Select the right SWx Pull down resistor (PG4, 02h) and CSy Pull up resistor (PG4, 02h) which eliminates the ghost LED for a particular matrix layout configuration.

Typically, selecting the $32 k \Omega$ will be sufficient to eliminate the LED ghost phenomenon.
The SWx Pull down resistors and CSy Pull up resistors are active only when the CSy/SWx output working the OFF state and therefore no power is lost through these resistors.

## SHUTDOWN MODE

Shutdown mode can be used as a means of reducing power consumption. During shutdown mode all registers retain their data.

## Software Shutdown

By setting SSD bit of the Configuration Register (PG4, 00 h ) to " 0 ", the IS31FL3741A will operate in software shutdown mode. When the IS31FL3741A is in software shutdown, all current sources are switched off, so that the matrix is blanked. All registers can be operated. Typical current consume is $1 \mu \mathrm{~A}$ when VCC=5V.

## Hardware Shutdown

The chip enters hardware shutdown when the SDB pin is pulled low. All analog circuits are disabled during hardware shutdown, typical the current consume is $1 \mu \mathrm{~A}$ when $\mathrm{VCC}=5 \mathrm{~V}$.

The chip releases hardware shutdown when the SDB pin is pulled high. When set SDB high, the rising edge will reset the I2C module, but the register information retains. During hardware shutdown state Function Register can be operated.

If VCC has risk drop below 1.75 V but above 0.1 V during SDB pulled low, please re-initialize all Function Registers before SDB pulled high.

## LAYOUT

As described in external resistor ( $\mathrm{R}_{\text {ISET }}$ ), the chip consumes lots of power. Please consider below factors when layout the PCB.

1. The $\mathrm{V}_{\mathrm{CC}}$ (PVCC, AVCC) capacitors need to close to the chip and the ground side should well connect to the GND of the chip.
2. $R_{\text {ISET }}$ should be close to the chip and the ground side should well connect to the GND of the chip.
3. The thermal pad should connect to ground pins and the PCB should have the thermal pad too, usually this pad should have 16 or 25 via thru the PCB to other side's ground area to help radiate the heat. About the thermal pad size, please refer to the land pattern of each package.
4. The CSy pins maximum current is 38 mA ( $\mathrm{R}_{\text {ISET }}=10 \mathrm{k} \Omega$ ), and the SWx pins maximum current is larger, the width of the trace, SWx should have wider trace then CSy.

CLASSIFICATION REFLOW PROFILES
