## 24-RGB MATRIX LED DRIVER

April 2021

## GENERAL DESCRIPTION

The IS31FL3746A is a general purpose $18 \times n(n=1 \sim 4)$ LED Matrix programmed via 1 MHz I2C compatible interface. Each LED can be dimmed individually with 8bit PWM data and 8-bit DC scaling (Color Calibration) data which allowing 256 steps of linear PWM dimming and 256 steps of DC current adjustable level.
Additionally each LED open and short state can be detected, IS31FL3746A store the open or short information in Open-Short Registers. The Open-Short Registers allowing MCU to read out via I2C compatible interface. Inform MCU whether there are LEDs open or short and the locations of open or short LEDs.

The IS31FL3746A operates from 2.7 V to 5.5 V and features a very low shutdown and operational current.

IS31FL3746A is available in QFN-32 ( $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ ) package. It operates from 2.7 V to 5.5 V over the temperature range of $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$.

## FEATURES

- Supply voltage range: 2.7 V to 5.5 V
- 18 current sinks
- Support $18 \times n$ ( $n=1 \sim 4$ ) LED matrix configurations
- Accurate color rendition
- 8-bit PWM
- 8-bit dot correction
- 8-bit global current adjust
- SDB rising edge reset I2C module
- 29 kHz PWM frequency
- 1 MHz I2C-compatible interface
- Individual open and short error detect function
- 180 degree phase delay operation to reduce power noise
- Spread spectrum
- De-ghost
- QFN-32 (4mm $\times 4 \mathrm{~mm}$ ) package

## APPLICATIONS

- Hand-held devices for LED display
- Gaming device (Mouse, Mouse MAT etc.)
- IOT device (Al speaker etc.)

TYPICAL APPLICATION CIRCUIT

Figure 1 Typical Application Circuit: $18 \times 4,24$ RGBs

TYPICAL APPLICATION CIRCUIT (CONTINUED)

Figure 2 Typical Application Circuit: 72 Mono Color LEDs

Note 1: IC should be placed far away from the antenna in order to prevent the EMI.
Note 2: The $20 \Omega$ or $51 \Omega$ resistors between LED and IC are only for thermal reduction, for mono red LED, if $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}$, don't need these resistors.
Note 3: The $\mathrm{V}_{1 H}$ of I2C bus should be same as VIO pin. VIO pin need to connect to a reference voltage and usually it is same as the VCC of MCU . If VCC of MCU is $1.8 \mathrm{~V}, \mathrm{~V}_{10}=1.8 \mathrm{~V}$, if $\mathrm{V}_{\mathrm{cc}}$ of MCU is $5 \mathrm{~V}, \mathrm{~V}_{10}=5 \mathrm{~V}$.

PIN CONFIGURATION

| Package | Pin Configuration (Top View) |
| :---: | :---: |
| QFN-32 |  |

PIN DESCRIPTION

| No. | Pin | Description |
| :--- | :--- | :--- |
| $1 \sim 8,10 \sim 18$ | CS2~CS18 | Current sink pin for LED matrix. |
| 9,30 | GND | Ground. |
| 19 | VIO | Input logic reference voltage, can't be floated. |
| 20 | SDB | Shutdown pin. |
| 21 | SCL | I2C compatible serial clock. |
| 22 | ADDR1 | I2C address select. |
| 23 | SDA | I2C compatible serial data. |
| 24 | ADDR2 | I2C address select. |
| $25 \sim 28$ | SW4~SW1 | Power SW. |
| 29 | VCC | Power for current source SW and analog. |
| 31 | ISET | Set the maximum IOUT current. |
| 32 | CS1 | Current sink pin for LED matrix. |
|  | Thermal Pad | Connect to GND. |

ORDERING INFORMATION

## ABSOLUTE MAXIMUM RATINGS

| Supply voltage, VCC | $-0.3 \mathrm{~V} \sim+6.0 \mathrm{~V}$ |
| :--- | :--- |
| Voltage at any input pin | $-0.3 \mathrm{~V} \sim \mathrm{~V} \mathrm{CC}+0.3 \mathrm{~V}$ |
| Maximum junction temperature, $\mathrm{T}_{\mathrm{Jmax}}$ | $+150^{\circ} \mathrm{C}$ |
| Storage temperature range, $\mathrm{T}_{\mathrm{STG}}$ | $-65^{\circ} \mathrm{C} \sim+150^{\circ} \mathrm{C}$ |
| Operating temperature range, $\mathrm{T}_{\mathrm{A}}=\mathrm{T}_{\mathrm{J}}$ | $-40^{\circ} \mathrm{C} \sim+125^{\circ} \mathrm{C}$ |
| Package thermal resistance, junction to ambient (4 layer standard <br> test PCB based on JESD 51-2A), $\mathrm{\theta JA}$ | $52^{\circ} \mathrm{C} / \mathrm{W}$ |
| ESD (HBM) | $\pm 8 \mathrm{kV}$ |
| ESD (CDM) | $\pm 750 \mathrm{~V}$ |

Note 4: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS
The following specifications apply for $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, unless otherwise noted.

| Symbol | Parameter | Conditions | Min. | Typ. | Max. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Vcc | Supply voltage |  | 2.7 |  | 5.5 | V |
| Icc | Quiescent power supply current | Vsdb $=\mathrm{V}_{\text {cc }}$, all LEDs off |  | 2.3 |  | mA |
| ISD | Shutdown current | Vsdb $=0 \mathrm{~V}$ |  | 2.8 |  | $\mu \mathrm{A}$ |
|  |  | $V_{\text {sdB }}=V_{\text {cc }}$, Configuration Register written "0000 0000 |  | 2.8 |  |  |

FUNCTIONAL BLOCK DIAGRAM

## DETAILED DESCRIPTION

## I2C INTERFACE

IS31FL3746A uses a serial bus, which conforms to the I2C protocol, to control the chip's functions with two wires: SCL and SDA. The IS31FL3746A has a 7-bit slave address (A7:A1), followed by the R/W bit, A0. Set $A 0$ to " 0 " for a write command and set A0 to " 1 " for a read command. The value of bits A1 and A2 are decided by the connection of the ADDRx pin.

Table 1 Slave Address:

| ADDR2 | ADDR1 | A7:A5 | A4:A3 | A2:A1 | A0 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| GND | GND | 110 | 00 | 00 | 0/1 |
| GND | SCL |  | 00 | 01 |  |
| GND | SDA |  | 00 | 10 |  |
| GND | VCC |  | 00 | 11 |  |
| SCL | GND |  | 01 | 00 |  |
| SCL | SCL |  | 01 | 01 |  |
| SCL | SDA |  | 01 | 10 |  |
| SCL | VCC |  | 01 | 11 |  |
| SDA | GND |  | 10 | 00 |  |
| SDA | SCL |  | 10 | 01 |  |
| SDA | SDA |  | 10 | 10 |  |
| SDA | VCC |  | 10 | 11 |  |
| VCC | GND |  | 11 | 00 |  |
| VCC | SCL |  | 11 | 01 |  |
| VCC | SDA |  | 11 | 10 |  |
| VCC | VCC |  | 11 | 11 |  |

ADDR1/2 connected to GND, (A2:A1)/(A4:A3) $=00$; ADDR1/2 connected to VCC, (A2:A1)/(A4:A3) $=11$; ADDR1/2 connected to SCL, (A2:A1)/(A4:A3) $=01$; ADDR1/2 connected to SDA, (A2:A1)/(A4:A3)=10;

The SCL line is uni-directional. The SDA line is bidirectional (open-drain) with a pull-up resistor (typically 400 kHz 12 C with $4.7 \mathrm{k} \Omega, 1 \mathrm{MHz} 12 \mathrm{C}$ with $2 \mathrm{k} \Omega$ ). The maximum clock frequency specified by the I2C standard is 1 MHz . In this discussion, the master is the microcontroller and the slave is the IS31FL3746A.

The timing diagram for the I2C is shown in Figure 3. The SDA is latched in on the stable high level of the SCL. When there is no interface activity, the SDA line should be held high.

The "START" signal is generated by lowering the SDA signal while the SCL signal is high. The start signal will alert all devices attached to the I2C bus to check the incoming address against their own chip address.

The 8-bit chip address is sent next, most significant bit first. Each address bit must be stable while the SCL level is high

After the last bit of the chip address is sent, the master checks for the IS31FL3746A's acknowledge. The master releases the SDA line high (through a pull-up resistor). Then the master sends an SCL pulse. If the IS31FL3746A has received the address correctly, then it holds the SDA line low during the SCL pulse. If the SDA line is not low, then the master should send a "STOP" signal (discussed later) and abort the transfer.

Following acknowledge of IS31FL3746A, the register address byte is sent, most significant bit first. IS31FL3746A must generate another acknowledge indicating that the register address has been received.
Then 8-bit of data byte are sent next, most significant bit first. Each data bit should be valid while the SCL level is stable high. After the data byte is sent, the IS31FL3746A must generate another acknowledge to indicate that the data was received.

The "STOP" signal ends the transfer. To signal "STOP", the SDA signal goes high while the SCL signal is high.

## ADDRESS AUTO INCREMENT

To write multiple bytes of data into IS31FL3746A, load the address of the data register that the first data byte is intended for. During the IS31FL3746A acknowledge of receiving the data byte, the internal address pointer will increment by one. The next data byte sent to IS31FL3746A will be placed in the new address, and so on. The auto increment of the address will continue as long as data continues to be written to IS31FL3746A (Figure 6).

## READING OPERATION

Most of the registers can be read.
To read the FCh, FEh, after I2C start condition, the bus master must send the IS31FL3746A device address with the $\mathrm{R} / \overline{\mathrm{W}}$ bit set to " 0 ", followed by the register address (FEh or F1h) which determines which register is accessed. Then restart I2C, the bus master should send the IS31FL3746A device address with the R/W bit set to "1". Data from the register defined by the command byte is then sent from the IS31FL3746A to the master (Figure 7).
To read the registers of Page 0 thru Page 1, the FDh should write with 00 h before follow the Figure 7 sequence to read the data. That means, when you want to read registers of Page 0, the FDh should point to Page 0 first and you can read the Page 0 data.

| SDA | SCL |  | 10 | 01 |  |
| SDA | SDA |  | 10 | 10 |  |
| SDA | VCC |  | 10 | 11 |  |
| VCC | GND |  | 11 | 00 |  |
| VCC | SCL |  | 11 | 01 |  |
| VCC | SDA |  | 11 | 10 |  |
| VCC | VCC |  | 11 | 11 |  |

ADDR1/2 connected to GND, (D2:D1)/(D4:D3)=00;
ADDR1/2 connected to VCC, (D2:D1)/(D4:D3)=11;
ADDR1/2 connected to SCL, (D2:D1)/(D4:D3)=01;
ADDR1/2 connected to SDA, (D2:D1)/(D4:D3)=10;

## REGISTER CONTROL

Table 3 FDh Command Register

| Data | Function |
| :---: | :--- |
| 00000000 | Point to Page 0 (PG0, PWM Register is available) |
| 00000001 | Point to Page 1 (PG1, White Balance Scaling and Function Register is available) |
| Others | Reserved |

Note: FDh is locked when power up, need to unlock this register before write command to it. See Table 4 for detail.
The Command Register should be configured first after writing in the slave address to choose the available register. Then write data in the choosing register. Power up default state is "0000 0000".
For example, when write "0000 0001" in the Command Register (FDh), the data which writing after will be stored in PG1 registers. Write new data can configure other registers.

Table 4 FEh Command Register Write Lock (Read/Write)

| Bit | D7:D0 |
| :---: | :---: |
| Name | CRWL |
| Default | 00000000 (FDh write disable) |

To select the PG0~PG1, need to unlock this register first, with the purpose to avoid mis-operation of this register. When FEh is written with $0 \times C 5$, FDh is allowed to modify once, after the FDh is modified the FEh will reset to be $0 \times 00$ at once.

Table 5 Register Definition

| Address | Name | Function | Table | R/W | Default |
| :---: | :---: | :---: | :---: | :---: | :---: |
| PG0 (0x00): PWM Registers |  |  |  |  |  |

| 01h~48h | Scaling Register | Set Scaling for each LED | 7 | R/W | 00000000 |
| 50h | Configuration Register | Configure the operation mode | 9 | R/W | 00000000 |
| 51h | Global Current Control Register | Set the global current | 10 | R/W | 00000000 |
| 52h | Pull Down/Up Resistor Selection Register | Set the pull down resistor for SWx and pull up resistor for CSy | 11 | R/W | 00110011 |
| 53h~5Eh | Open/Short Register | Store the open or short information | 12 | R | 00000000 |
| 5Fh | Temperature Status | Store the temperature point of the IC | 13 | R/W | 00000000 |
| 60h | Spread Spectrum Register | Spread spectrum function enable | 14 | R/W | 00000000 |
| 8Fh | Reset Register | Reset all register to POR state | - | W | 00000000 |
| EOh | PWM Frequency Enable Register | Enable PWM frequency setting | 15 | W | 00000000 |
| E2h | PWM Frequency Setting Register | Set the PWM frequency | 16 | W | 000x xxxx |

Page 0 (PG0, FDh= 0x00): PWM Register

Figure 8 PWM Register

Table 6 PG0: 01h~48h PWM Register

| Bit | D7:D0 |
| :---: | :---: |
| Name | PWM |
| Default | 00000000 |

Each dot has a byte to modulate the PWM duty in 256 steps.
The value of the PWM Registers decides the average current of each LED noted ILed.
lled computed by Formula (1):

$$
\begin{gather*}
I_{L E D}=\frac{P W M}{256} \times I_{\text {OUT }(P E A K)} \times D u t y  \tag{1}\\
P W M=\sum_{n=0}^{7} D[n] \cdot 2^{n}
\end{gather*}
$$

Where Duty is the duty cycle of $S W x$,

$$
\begin{equation*}
\text { Duty }=\frac{33 \mu s}{(33 \mu s+0.83 \mu+0.3 s)} \times \frac{1}{4}=\frac{1}{4.14} \tag{2}
\end{equation*}
$$

lout is the output current of CSy $(y=1 \sim 18)$,

$$
\begin{equation*}
I_{O U T(P E A K)}=\frac{343}{R_{I S E T}} \times \frac{G C C}{256} \times \frac{S L}{256} \tag{3}
\end{equation*}
$$

GCC is the Global Current Control Register (PG1, 51 h ) value, SL is the Scaling Register value as Table 9 and RISET is the external resistor of ISET pin. D[n] stands for the individual bit value, 1 or 0 , in location n . For example: if $D 7: D 0=10110101$ ( $0 x B 5,181$ ), $G C C=1111$ 1111, R ISET $=10 \mathrm{k} \Omega, \mathrm{SL}=1111$ 1111:

$$
I_{L E D}=\frac{343}{10 k \Omega} \times \frac{255}{256} \times \frac{255}{256} \times \frac{1}{4.14} \times \frac{181}{256}
$$

Page 1 (PG1, FDh= 0x01): Scaling Register

Figure 9 Scaling Register

Table 7 PG1: 01h ~ 48h Scaling Register

| Bit | D7:D0 |
| :---: | :---: |
| Name | SL |
| Default | 00000000 |

Scaling register control the DC output current of each dot. Each dot has a byte to modulate the scaling in 256 steps.

The value of the Scaling Register decides the peak current of each LED noted lout(PEAK).
lout(РЕАК) computed by Formula (3):

$$
\begin{equation*}
I_{\text {OUT }(P E A K)}=\frac{343}{R_{\text {ISET }}} \times \frac{G C C}{256} \times \frac{S L}{256} \tag{3}
\end{equation*}
$$

lout is the output current of CSy $(y=1 \sim 18), G C C$ is the Global Current Control Register (PG1, 51h) value and $\mathrm{R}_{\text {ISET }}$ is the external resistor of $\mathrm{R}_{\text {ISET }}$ pin. $\mathrm{D}[\mathrm{n}]$ stands for the individual bit value, 1 or 0 , in location $n$.

For example: if $\mathrm{R}_{\text {ISET }}=10 \mathrm{k} \Omega$, GCC=1111 1111, SL=0111 1111:

$$
\mathrm{S} L=\sum_{n=0}^{7} D[n] \cdot 2^{n}=127
$$

$$
I_{o u t}=\frac{343}{10 k \Omega} \times \frac{255}{256} \times \frac{127}{256}=16.8 \mathrm{~mA}
$$

$$
I_{L E D}=16.8 m A \times \frac{1}{4.14} \times \frac{P W M}{256}
$$

$$
\mathrm{S} L=\sum_{n=0}^{7} D[n] \cdot 2^{n}
$$

Table 8 Page 1 (PG1, FDh=0x01): Function Register

| Register | Name | Function | Table | R/W | Default |
| :---: | :--- | :--- | :---: | :---: | :---: |

Table 9 50h Configuration Register

| Bit | D7:D4 | D3 | D2:D1 | D0 |
| :---: | :---: | :---: | :---: | :---: |
| Name | SWS | - | OSDE | SSD |
| Default | 0000 | 0 | 00 | 0 |

The Configuration Register sets operating mode of IS31FL3746A.

SWS SWx Setting
0000 SW1~SW4, 1/4
0001 SW1~SW3, 1/3, SW4 no-active
0010 SW1~SW2, 1/2, SW3~SW4 no-active
0011 All CSy work as current sinks only, no scan
Others SW1~SW4, 1/4

OSDE Open Short Detection Enable
00 Disable open/short detection
01/11 Enable open detection
10 Enable short detection
SSD Software Shutdown Control
0 Software shutdown
1 Normal operation
When OSDE set to " 01 ", open detection will be trigger once, the user could trigger open detection again by set OSDE from " 00 " to " 01 ".
When OSDE set " 10 ", short detection will be trigger once, the user could trigger short detection again by set OSDE from "00" to " 10 ".
When SSD is "0", IS31FL3746A works in software shutdown mode and to normal operate the SSD bit should set to " 1 ".

SWS control the duty cycle of the SWx, default mode is $1 / 4$.

Table 10 51h Global Current Control Register

| Bit | D7:D0 |
| :---: | :---: |
| Name | GCC |
| Default | 00000000 |

The Global Current Control Register modulates all CSy ( $\mathrm{y}=1 \sim 18$ ) DC current which is noted as lout in 256 steps. lout is computed by the Formula (3):

$$
\begin{aligned}
& I_{\text {OUT (PEAK) }}=\frac{343}{R_{\text {ISET }}} \times \frac{G C C}{256} \times \frac{S L}{256} \\
& G C C=\sum_{n=0}^{7} D[n] \cdot 2^{n}
\end{aligned}
$$

Where $D[n]$ stands for the individual bit value, 1 or 0 , in location n .

| 110 | 453 Hz |

## APPLICATION INFORMATION

Figure 11 Scanning Timing

## SCANING TIMING

As shown in Figure 11, the SW1~SW4 is turned on by serial, LED is driven 4 by 4 within the SWx $(x=1 \sim 4)$ on time (SWx, $x=1 \sim 4$ is source and it is high when LED on), including the non-overlap blanking time during scan, the duty cycle of $\operatorname{SWx}$ (active high, $x=1 \sim 4$ ) is:

$$
\begin{equation*}
\text { Duty }=\frac{33 \mu s}{(33 \mu s+0.83 \mu s+0.3 \mu s)} \times \frac{1}{4}=\frac{1}{4.14} \tag{2}
\end{equation*}
$$

Where $33 \mu \mathrm{~s}$ is tscan, the period of scanning, $0.83 \mu \mathrm{~s}$ is $t_{\text {NOL1 }}, 0.3 \mu \mathrm{~s}$ is $t_{\text {NOL2 }}$, the non-overlap time and CSy $(y=1 \sim 18)$ delay time.

## PWM CONTROL

After setting the lout and GCC, the brightness of each LEDs (LED average current (lLed)) can be modulated with 256 steps by PWM Register, as described in Formula (1).

$$
\begin{equation*}
I_{L E D}=\frac{P W M}{256} \times I_{O U T(P E A K)} \times D u t y \tag{1}
\end{equation*}
$$

Where PWM is PWM Registers (PG0, 01h~48h /PG0) data showing in Table 6.
For example, in Figure 1, if $\mathrm{RISET}=10 \mathrm{k} \Omega, \mathrm{PWM}=255$, and GCC $=255$, SL= 255, then

$$
\begin{gathered}
I_{O U T(P E A K)}=\frac{243}{10 k \Omega} \times \frac{255}{256} \times \frac{255}{256}=34 m A \\
I_{L E D}=I_{O U T(P E A K)} \times \frac{1}{4.14} \times \frac{P W M}{256}
\end{gathered}
$$

Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve a breathing effect.

## GAMMA CORRECTION

In order to perform a better visual LED breathing effect we recommend using a gamma corrected PWM value to set the LED intensity. This results in a reduced number of steps for the LED intensity setting, but causes the change in intensity to appear more linear to the human eye.

Gamma correction, also known as gamma compression or encoding, is used to encode linear luminance to match the non-linear characteristics of display. Since the IS31FL3746A can modulate the brightness of the LEDs with 256 steps, a gamma correction function can be applied when computing each subsequent LED intensity setting such that the changes in brightness matches the human eye's brightness curve.
Table 1732 Gamma Steps with 256 PWM Steps

Figure 12 Gamma Correction (32 Steps)
Choosing more gamma steps provides for a more continuous looking breathing effect. This is useful for very long breathing cycles. The recommended configuration is defined by the breath cycle T . When $\mathrm{T}=1 \mathrm{~s}$, choose 32 gamma steps, when $\mathrm{T}=2 \mathrm{~s}$, choose 64 gamma steps. The user must decide the final number of gamma steps not only by the LED itself, but also based on the visual performance of the finished product.

Figure 13 Gamma Correction ( 64 Steps)
Note: The data of 32 gamma steps is the standard value and the data of 64 gamma steps is the recommended value.

## OPERATING MODE

IS31FL3746A can only operate in PWM Mode. The brightness of each LED can be modulated with 256 steps by PWM registers. For example, if the data in PWM Register is "0000 0100", then the PWM is the fourth step.
Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve a breathing effect.

## OPEN/SHORT DETECT FUNCTION

IS31FL3746A has open and short detect bit for each LED.

By setting the OSD bits of the Configuration Register (PG1, 50 h ) from " 00 " to " 01 " or " 10 ", the LED Open/short Register will start to store the open/short information and after at least 2 scanning cycles and the MCU can get the open/short information by reading the 53h~5Eh, for those dots are turned off via LED Scaling Registers (PG1, 01h~48h), the open/short data will not get refreshed when setting the OSD bit of the Configuration Register.
To get the correct open and short information, two configurations need to set before setting the OSD bits:
$10 \times 0 F \leq G C C \leq 0 \times 40$
$252 \mathrm{~h}=0 \times 00$
Where GCC is the Global Current Control Register (PG1, 51h) and 52h is the Pull Down/UP Resistor Selection Register and set to $0 \times 00$ is to disable the SWx pull-down and CSy pull-up function.

The detect action is one-off event and each time before reading out the open/short information, the OSDE bit of the Configuration Register (PG1, 50h) need to be set from " 00 " to " 01 "/ " 10 " (clear before set operation).

## DE-GHOST FUNCTION

The "ghost" term is used to describe the behavior of an LED that should be OFF but instead glows dimly when another LED is turned ON. A ghosting effect typically can occur when multiplexing LEDs. In matrix architecture any parasitic capacitance found in the constant-current outputs or the PCB traces to the LEDs may provide sufficient current to dimly light an LED to create a ghosting effect.
To prevent this LED ghost effect, the IS31FL3746A has integrated Pull down resistors for each SWx ( $x=1 \sim 4$ ) and Pull up resistors for each CSy ( $y=1 \sim 18$ ). Select the right SWx Pull down resistor (PG1, 52h) and CSy Pull up resistor (PG1, 52h) which eliminates the ghost LED for a particular matrix layout configuration.

Typically, selecting the $8 \mathrm{k} \Omega$ will be sufficient to eliminate the LED ghost phenomenon.

The SWx pull down resistors and CSy pull up resistors are active only when the CSy/SWx output working the OFF state and therefore no power is lost through these resistors.

When IS31FL3746A works in hardware shutdown mode, the de-ghost function should be disabled, otherwise it will be extra about $1 \mu \mathrm{~A}$ shutdown current.

## I2C RESET

The I2C will be reset if the SDB pin is pull-high from 0 V to logic high, at the operating SDB rising edge, the I2C operation is not allowed.

## SHUTDOWN MODE

Shutdown mode can be used as a means of reducing power consumption. During shutdown mode all registers retain their data.

## Software Shutdown

By setting SSD bit of the Configuration Register (PG1, 50h) to "0", the IS31FL3746A will operate in software shutdown mode. When the IS31FL3746A is in software shutdown, all current sources are switched off, so that the matrix is blanked. All registers can be operated. Typical current consume is $2.8 \mu \mathrm{~A}$.

## Hardware Shutdown

The chip enters hardware shutdown when the SDB pin is pulled low. All analog circuits are disabled during hardware shutdown, typical the current consume is $2.8 \mu \mathrm{~A}$.

The chip releases hardware shutdown when the SDB pin is pulled high. During hardware shutdown state Function Register can be operated.

If Vcc has risk drop below 1.75 V but above 0.1 V during SDB pulled low, please re-initialize all Function Registers before SDB pulled high.

## LAYOUT

The IS31FL3746A consumes lots of power so good PCB layout will help improve the reliability of the chip. Please consider below factors when layout the PCB.

## Power Supply Lines

When designing the PCB layout pattern, the first step should consider about the supply line and GND connection, especially those traces with high current, also the digital and analog blocks' supply line and GND should be separated to avoid the noise from digital block affect the analog block.

At least one $0.1 \mu \mathrm{~F}$ capacitor, if possible with a $0.47 \mu \mathrm{~F}$ or $1 \mu \mathrm{~F}$ capacitor is recommended to connected to the ground at each power supply pins of the chip, and it needs to close to the chip and the ground net of the capacitor should be well connected to the GND plane.

## $\mathrm{R}_{\text {ISET }}$

$R_{\text {ISET }}$ should be close to the chip and the ground side should well connect to the GND plane.

## Thermal Consideration

The over temperature of the chip may result in deterioration of the properties of the chip. IS31FL3746A has thermal pad but the chip could be very hot if power is very large. So do consider the ground area connects to the GND pins and thermal pad. Other traces should keep away and ensure the ground area below the package is integrated, and the back layer should be connected to the thermal pad thru 9 or 16 vias to be maximized the area size of ground plane.

## Current Rating Example

For a $\mathrm{R}_{\text {ISET }}=10 \mathrm{k} \Omega$ application, the current rating for each net is as follows:

- VCC and SWx pins $=34 \mathrm{~mA} \times 18=612 \mathrm{~mA}$, recommend trace width: $0.2032 \mathrm{~mm} \sim 0.5 \mathrm{~mm}$.
- CSy pins $=34 \mathrm{~mA}$, recommend trace width: $0.1016 \mathrm{~mm} \sim 0.254 \mathrm{~mm}$.
- All other pins < 3 mA , recommend trace width: $0.1016 \mathrm{~mm} \sim 0.254 \mathrm{~mm}$.
