IS32FL3236A

36-CHANNEL LED DRIVER; SELECTABLE PWM FREQUENCY

October 2019

GENERAL DESCRIPTION

IS32FL3236A is comprised of 36 constant current channels each with independent PWM control, designed for driving LEDs, PWM frequency can be 3kHz or 22kHz. The output current of each channel can be set at up to 38mA (Max.) by an external resistor and independently scaled by a factor of 1, 1/2, 1/3 and 1/4. The average LED current of each channel can be changed in 256 steps by changing the PWM duty cycle through an I2C interface.

The chip can be turned off by pulling the SDB pin low or by using the software shutdown feature to reduce power consumption.

IS32FL3236A is available in eTQFP-48 package. It operates from 2.7V to 5.5V over the temperature range of -40°C to +125°C.

FEATURES

- 2.7V to 5.5V supply
- I2C interface, automatic address increment function
- Four selectable I2C addresses
- Internal reset register
- Modulate LED brightness with 256 steps PWM
- Each channel can be controlled independently
- Each channel can be scaled independently by 1, 1/2, 1/3 and 1/4
- PWM frequency selectable
  - 3kHz (default)
  - 22kHz
- -40°C to +125°C temperature range
- eTQFP-48 package
- AEC-Q100 Qualified

APPLICATIONS

- Auto display panel backlight
- Auto ambient light
- LED in auto appliances
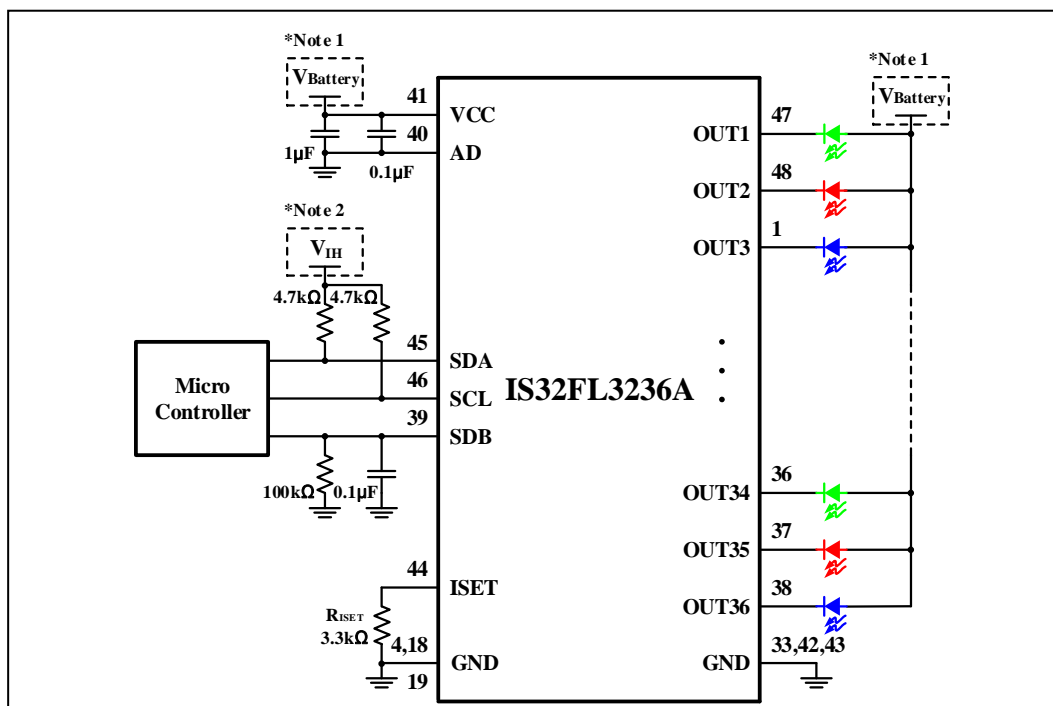

TYPICAL APPLICATION CIRCUIT

**Figure 1**   Typical Application Circuit

Figure 2   Typical Application Circuit (V_{CC}=5V)

Note 1: V_{LED+} should be same as VCC voltage.

Note 2: V_{IH} is the high level voltage for IS32FL3236A, which is usually same as VCC of Micro Controller, e.g. if VCC of Micro Controller is 3.3V, V_{IH}=3.3V. If V_{CC}=5V and V_{IH} is lower than 2.8V, recommend to add a level shift circuit.

Note 3: These resistors are optional to help reduce the power of IS32FL3236A only (values are for V_{LED+}=5V).

Note 4: The output current is set up to 23mA when R_{ISET}= 3.3kΩ. The maximum global output current can be set by external resistor, R_{ISET}. Please refer to the detail application information in R_{ISET} section.

Note 5: The IC should be placed far away from the antenna in order to prevent the EMI.

IS32FL3236A

PIN CONFIGURATION

Package	Pin Configuration (Top View)
eTQFP-48	
PIN DESCRIPTION

No.	Pin	Description
1~3	OUT3 ~ OUT5	Output channel 3~5 for LEDs.
4,18,19, 33,42,43	GND	Ground.
5~17	OUT6 ~ OUT18	Output channel 6~18 for LEDs.
20~32	OUT19 ~ OUT31	Output channel 19~31 for LEDs.
34~38	OUT32 ~ OUT36	Output channel 32~36 for LEDs.
39	SDB	Shutdown the chip when pulled low.
40	AD	I2C address setting.
41	VCC	Power supply.
44	ISET	Input terminal used to connect an external resistor. This regulates the global output current.
45	SDA	I2C serial data.
46	SCL	I2C serial clock.
47,48	OUT1, OUT2	Output channel 1, 2 for LEDs.
	Thermal Pad	Need to connect to GND.

ABSOLUTE MAXIMUM RATINGS

Supply voltage, V_{CC}	-0.3V ~ +6.0V
Voltage at SCL, SDA, SDB, OUT1 to OUT36	-0.3V ~ V_{CC}+0.3V
Maximum junction temperature, T_{JMAX}	+150°C
Storage temperature range, T_{STG}	-65°C ~ +150°C
Operating temperature range, $T_A = T_J$	-40°C ~ +125°C
Package thermal resistance, junction to ambient (4 layer standard test PCB based on JEDEC standard), θ_{JA}	38.72°C/W
Package thermal resistance, junction to thermal PAD (4 layer standard test PCB based on JESD 51-2A), θ_{JP}	7.576°C/W
ESD (HBM)	±2kV
ESD (CDM)	±750V

Note 6: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

Typical values are T_A = 25°C, V_{CC} = 5V.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
V_{CC}	Supply voltage		2.7		5.5	V
I_{MAX}	Maximum global output current	V_{CC}= 4.2V, V_{OUT}= 0.8V R_{ISET}= 2kΩ, SL= "00" (Note 7)		38		mA
I_{OUT}	Output current	V_{OUT}= 0.6V, R_{ISET} = 3.3kΩ, SL= "00"	17.5	23	28.5	mA
ΔI_{MAT}	Channel mismatch	V_{OUT}= 0.6V, R_{ISET} = 3.3kΩ, SL= "00"	-6		6	%
V_{HR}	Headroom voltage	R_{ISET} = 3.3kΩ, I_{OUT}= 20mA		0.4	0.6	V
I_{CC}	Quiescent power supply current	R_{ISET} = 3.3kΩ	6.5	9	11	mA
I_{SD}	Shutdown current	V_{SDB}= 0V or software shutdown	6	7	10	µA
f_{OUT}	PWM frequency of output	0x4B= 0x00	2	3.5	5	kHz
		0x4B= 0x01	23	26	35	kHz
I_{OZ}	Output leakage current	V_{SDB}= 0V or software shutdown, V_{OUT}= 5.5V			0.2	µA
T_{SD}	Thermal shutdown	(Note 7)		160		°C
T_{SD_HYS}	Thermal shutdown hysteresis	(Note 7)		20		°C
V_{ISET}	Output voltage of ISET pin		1.0	1.3	1.6	V

IS32FL3236A

DIGITAL INPUT SWITCHING CHARACTERISTICS (NOTE 8)

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
f_{SCL}	Serial-Clock frequency				400	kHz
t_{BUF}	Bus free time between a STOP and a START condition		1.3			µs
$t_{HD, STA}$	Hold time (repeated) START condition		0.6			µs
$t_{SU, STA}$	Repeated START condition setup time		0.6			µs
$t_{SU, STO}$	STOP condition setup time		0.6			µs
$t_{HD, DAT}$	Data hold time				0.9	µs
$t_{SU, DAT}$	Data setup time		100			ns
t_{LOW}	SCL clock low period		1.3			µs
t_{HIGH}	SCL clock high period		0.7			µs
t_R	Rise time of both SDA and SCL signals, receiving	(Note 9)		$20+0.1C_b$	300	ns
t_F	Fall time of both SDA and SCL signals, receiving	(Note 9)		$20+0.1C_b$	300	ns

Note 7: The recommended minimum value of R_{ISET} is 2kΩ, or it may cause a large current.

Note 8: Guaranteed by design.

Note 9: C_b = total capacitance of one bus line in pF. $I_{SINK} \leq 6mA$. t_R and t_F measured between $0.3 \times V_{CC}$ and $0.7 \times V_{CC}$.

IS32FL3236A

DETAILED DESCRIPTION

I2C INTERFACE

The IS32FL3236A uses a serial bus, which conforms to the I2C protocol, to control the chip's functions with two wires: SCL and SDA. The IS32FL3236A has a 7-bit slave address (A7:A1), followed by the R/W bit, A0. Since IS32FL3236A only supports write operations, A0 must always be "0". The value of bits A1 and A2 are decided by the connection of the AD pin.

The complete slave address is:

Table 1 Slave Address (Write only):

Bit	A7:A3	A2:A1	A0
Value	01111	AD	0

AD connected to GND, AD = 00;
AD connected to VCC, AD = 11;
AD connected to SCL, AD = 01;
AD connected to SDA, AD = 10;

The SCL line is uni-directional. The SDA line is bi-directional (open-collector) with a pull-up resistor (typically 4.7kΩ). The maximum clock frequency specified by the I2C standard is 400kHz. In this discussion, the master is the microcontroller and the slave is the IS32FL3236A.

The timing diagram for the I2C is shown in Figure 3. The SDA is latched in on the stable high level of the SCL. When there is no interface activity, the SDA line should be held high.

The "START" signal is generated by lowering the SDA signal while the SCL signal is high. The start signal will alert all devices attached to the I2C bus to check the incoming address against their own chip address.

The 8-bit chip address is sent next, most significant bit first. Each address bit must be stable while the SCL level is high.

After the last bit of the chip address is sent, the master checks for the IS32FL3236A's acknowledge. The master releases the SDA line high (through a pull-up resistor). Then the master sends an SCL pulse. If the IS32FL3236A has received the address correctly, then it holds the SDA line low during the SCL pulse. If the SDA line is not low, then the master should send a "STOP" signal (discussed later) and abort the transfer.

Following acknowledge of IS32FL3236A, the register address byte is sent, most significant bit first. IS32FL3236A must generate another acknowledge indicating that the register address has been received.

Then 8-bit of data byte are sent next, most significant bit first. Each data bit should be valid while the SCL level is stable high. After the data byte is sent, the IS32FL3236A must generate another acknowledge to indicate that the data was received.

The "STOP" signal ends the transfer. To signal "STOP", the SDA signal goes high while the SCL signal is high.

ADDRESS AUTO INCREMENT

To write multiple bytes of data into IS32FL3236A, load the address of the data register that the first data byte is intended for. During the IS32FL3236A acknowledge of receiving the data byte, the internal address pointer will increment by one. The next data byte sent to IS32FL3236A will be placed in the new address, and so on. The auto increment of the address will continue as long as data continues to be written to IS32FL3236A (Figure 6).

REGISTERS DEFINITIONS
Table 2 Register Function

Address	Name	Function	R/W	Table	Default
00h	Shutdown Register	Set software shutdown mode	W	3	0000 0000
01h~24h	PWM Register	36 channels PWM duty cycle data register		4	
25h	PWM Update Register	Load PWM Register and LED Control Register's data		-	xxxx xxxx
26h~49h	LED Control Register	Channel 1 to 36 enable bit and current setting		5	0000 0000
4Ah	Global Control Register	Set all channels enable		6	
4Bh	Output Frequency Setting Register	Set all channels operating frequency		7	0000 0000
4Fh	Reset Register	Reset all registers into default value		-	xxxx xxxx

Table 3   00h   Shutdown Register

Bit	D7:D1	D0
Name	-	SSD
Default	0000 000	0

The Shutdown Register sets software shutdown mode of IS32FL3236A.

SSD   Software Shutdown Enable
0   Software shutdown mode
1   Normal operation

Table 4   01h~24h   PWM Register (OUT1~OUT36)

Bit	D7:D0
Name	PWM
Default	0000 0000

The PWM Registers adjusts LED luminous intensity in 256 steps.

The value of a channel's PWM Register decides the average output current for each output, OUT1~OUT36. The average output current may be computed using the Formula (1):

$$\mathrm{I_{PWM}} = \frac{I_{OUT}}{256} \cdot \sum_{n=0}^{7} D[n] \cdot 2^n \qquad (1)$$

Where "n" indicates the bit location in the respective PWM register.

For example: D7:D0 = 10110101,

$$I_{OUT} = I_{MAX} (2^0+2^2+2^4+2^5+2^7)/256$$

The I_{OUT} of each channel is setting by the SL bit of LED Control Register (26h~49h). Please refer to the detail information in Page 11.

25h   PWM Update Register

The data sent to the PWM Registers and the LED Control Registers will be stored in temporary registers. A write operation of "0000 0000" value to the Update Register is required to update the registers (01h~24h, 26h~49h).

Table 5   26h~49h   LED Control Register (OUT1~OUT36)

Bit	D7:D3	D2:D1	D0
Name	-	SL	OUT
Default	00000	00	0

The LED Control Registers store the on or off state of each LED and set the output current.

SL   Output Current Setting (I_{OUT})
00   I_{MAX}
01          $I_{MAX}/2$
10          $I_{MAX}/3$
11          $I_{MAX}/4$

OUT   LED State
0   LED off
1   LED on

Table 6   4Ah   Global Control Register

Bit	D7:D1	D0
Name	-	G_EN
Default	0000 000	0

The Global Control Register set all channels enable.

G_EN   Global LED Enable
0   Normal operation
1   Shutdown all LEDs

Table 7   4Bh Output Frequency Setting Register

Bit	D7:D1	D0
Name	-	OFS
Default	0000 000	0

The Output Frequency Setting Register selects a fixed PWM operating frequency for all output channels.

OFS   Output Frequency Setting
0   3kHz
1   22kHz

4Fh   Reset Register

Once user writes "0000 0000" data to the Reset Register, IS32FL3236A will reset all registers to default value. On initial power-up, the IS32FL3236A registers are reset to their default values for a blank display.

IS32FL3236A

FUNCTIONAL BLOCK DIAGRAM

IS32FL3236A

TYPICAL APPLICATION INFORMATION

PWM CONTROL

The PWM Registers (01h~24h) can modulate LED brightness of 36 channels with 256 steps. For example, if the data in PWM Register is "0000 0100", then the PWM is the fourth step.

Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve a breathing effect.

R$_{ISET}$

The maximum output current of OUT1~OUT36 can be adjusted by the external resistor, R$_{ISET}$, as described in Formula (2).

$$I_{MAX} = x \cdot \frac{V_{ISET}}{R_{ISET}} \qquad (2)$$

x = 58.5, V$_{OUT}$ = 0.8V, V$_{ISET}$ = 1.3V.

The recommended minimum value of R$_{ISET}$ is 2kΩ.

CURRENT SETTING

The current of each LED can be set independently by the SL bit of LED Control Register (26h~49h). The maximum global current is set by the external register R$_{ISET}$.

When channels drive different quantity of LEDs, adjust maximum output current according to quantity of LEDs to ensure average current of each LED is the same.

For example, set R$_{ISET}$ = 3.3kΩ then I$_{MAX}$ = 23mA. If OUT1 drives two LEDs and OUT2 drives four LEDs, set the SL bit of LED Control Register (26h) to "01" and SL bit of LED Control Register (27h) to "00". So the current of OUT1 is I$_{OUT1}$ = I$_{MAX}$/2 = 11.5mA and the current of OUT2 is I$_{OUT2}$ = I$_{MAX}$ = 23mA. The average current of each LED is the same.
GAMMA CORRECTION

In order to perform a better visual LED breathing effect we recommend using a gamma corrected PWM value to set the LED intensity. This results in a reduced number of steps for the LED intensity setting, but causes the change in intensity to appear more linear to the human eye.

Gamma correction, also known as gamma compression or encoding, is used to encode linear luminance to match the non-linear characteristics of display. Since the IS32FL3236A can modulate the brightness of the LEDs with 256 steps, a gamma correction function can be applied when computing each subsequent LED intensity setting such that the changes in brightness matches the human eye's brightness curve.

Table 8   32 Gamma Steps With 256 PWM Steps

| C(0)	C(1)	C(2)	C(3)	C(4)	C(5)	C(6)	C(7)
0	1	2	4	6	10	13	18
C(8)	C(9)	C(10)	C(11)	C(12)	C(13)	C(14)	C(15)
22	28	33	39	46	53	61	69

78	86	96	106	116	126	138	149
C(24)	C(25)	C(26)	C(27)	C(28)	C(29)	C(30)	C(31)
161	173	186	199	212	226	240	255

Figure 7   Gamma Correction (32 Steps)

Choosing more gamma steps provides for a more continuous looking breathing effect. This is useful for very long breathing cycles. The recommended configuration is defined by the breath cycle T. When T=1s, choose 32 gamma steps, when T=2s, choose 64 gamma steps. The user must decide the final number of gamma steps not only by the LED itself, but also based on the visual performance of the finished product.

Table 9   64 Gamma Steps With 256 PWM Steps

Note: The data of 32 gamma steps is the standard value and the data of 64 gamma steps is the recommended value.

SHUTDOWN MODE

Shutdown mode can be used as a means of reducing power consumption. During shutdown mode all registers retain their data.

Software Shutdown

By setting SSD bit of the Shutdown Register (00h) to "0", the IS32FL3236A will operate in software shutdown mode. When the IS32FL3236A is in software shutdown mode, all current sources are switched off.

Hardware Shutdown

The chip enters hardware shutdown mode when the SDB pin is pulled low.

PWM FREQUENCY SELECT

The IS32FL3236A output channels operate with a default PWM frequency of 3kHz. Because all the OUTx channels are synchronized, the DC supply will experience large instantaneous current surges when the OUTx channels turn ON. These current surges will generate an AC ripple on the power supply which cause stress to the decoupling capacitors.

When the AC ripple is applied to a monolithic ceramic capacitor chip (MLCC) it will expand and contract causing the PCB to flex and generate audible hum in the range of between 20Hz to 20kHz, To avoid this hum, there are many countermeasures, such as selecting the capacitor type and value which will not cause the PCB to flex and contract.

An additional option for avoiding audible hum is to set the IS32FL3236A's output PWM frequency above the audible range. The Output Frequency Setting Register (4Bh)'s bit D0 can be used to set the switching frequency to 22kHz, which is beyond the audible range. Figure 9 below shows the variation of output PWM frequency across supply voltage and temperature.
Figure 9 V_{CC} vs. Output PWM Frequency

LAYOUT

The IS32FL3236A consumes lots of power so good PCB layout will help improve the reliability of the chip. Please consider below factors when layout the PCB.

Power Supply Lines

When designing the PCB layout pattern, the first step should consider about the supply line and GND connection, especially those traces with high current, also the digital and analog blocks' supply line and GND should be separated to avoid the noise from digital block affect the analog block.

At least one 0.1µF capacitor, if possible with a 1µF capacitor is recommended to connected to the ground at power supply pin of the chip, and it needs to close to the chip and the ground net of the capacitor should be well connected to the GND plane.

R_{ISET}

R_{ISET} should be close to the chip and the ground side should well connect to the GND plane.

Thermal Consideration

The over temperature of the chip may result in deterioration of the properties of the chip. The thermal pad of IS32FL3236A should connect to GND net and need to use 9 or 16 vias connect to GND copper area, the GND area should be as large area as possible to help radiate the heat from the IS32FL3236A.

Current Rating Example

For a R_{ISET}=3.3kΩ application, the current rating for each net is as follows:

• VCC pin maximum current is 8mA when V_{CC}=5V, but the VLED+ net is provide total current of all outputs, its current can as much as 23mA×36=828mA, recommend trace width for VCC pin: 0.20mm~0.3mm, recommend trace width for VLED+ net: 0.3mm~0.5mm,

• Output pins=23mA, recommend trace width is 0.2mm~0.254mm

• All other pins<3mA, recommend trace width is 0.15mm~0.254mm

RECOMMENDED LAND PATTERN

eTQFP-48

Note:

1. Land pattern complies to IPC-7351.

2. All dimensions in MM.

3. This document (including dimensions, notes & specs) is a recommendation based on typical circuit board manufacturing parameters. Since land pattern design depends on many factors unknown (eg. user's board manufacturing specs), user must determine suitability for use.
