IS66WV51216EALL
IS66/67WV51216EBLL

8Mb LOW VOLTAGE,
ULTRA LOW POWER PSEUDO CMOS STATIC RAM

Features

- High-Speed access time :
  - 70ns (IS66WV51216EALL)
  - 60ns (IS66/67WV51216EBLL)
- CMOS Lower Power Operation

- Single Power Supply
  - VDD =1.7V~1.95V(IS66WV51216EALL)
  - VDD =2.5V~3.6V (IS66/67WV51216EBLL)
- Three State Outputs
- Data Control for Upper and Lower bytes
- Lead-free Available

DESCRIPTION

The *ISSI* IS66WV51216EALL and IS66/67WV51216EBLL are high-speed,8M bit static RAMs organized as 512K words by 16 bits. It is fabricated using *ISSI*'s high performance CMOS technology.
This highly reliable process coupled with innovative circuit design techniques, yields high-performance and low power consumption devices.

When CS1# is HIGH (deselected) or when CS2 is LOW (deselected), the device assumes a standby mode at which the power dissipation can be reduced down with CMOS input levels.

Easy memory expansion is provided by using Chip Enable and Output Enable inputs. The active LOW Write Enable (WE#) controls both writing and reading of the memory. A data byte allows Upper Byte (UB#) and Lower Byte (LB#) access.

The IS66WV51216 EALL and IS66/67WV51216EBLL are packaged in the JEDEC standard 48-ball mini BGA (6mm x 8mm) and 44-Pin TSOP(TYPE-II). The device is also available for die sales.

POWER UP INITIALIZATION

IS66WV51216EALL and IS66/67WV51216EBLL include an on-chip voltage sensor used to launch the power-up initialization process. When VDD reaches a stable level at or above the VDD (min) the device will require 50μs to complete its self-initialization process. During the initialization period, CS1# should remain HIGH. When initializeation is complete, the device is ready for normal operation.

Notes:
1. Test conditions and output loading are specified in the AC Test Conditions and AC Test Loads (Figure 1) on page 5.
2. The internal write time is defined by the overlap of CS1#, UB#, LB# and WE# LOW, CS2 HIGH. All signals must be in valid states to initiate a Write, but anyone can go inactive to terminate Write. The Data Input Setup and Hold timing are referenced to the rising or falling edge of the signals that terminates the Write.
3. Tested with the load in Figure 2. Transition is measured ±100 mV from steady-state voltage. Not 100% tested.
4. t_{PWE} > t_{HzWE} + t_{SD} when OE# is LOW.
5. Chip Select Active Time (both CS1# LOW and CS2 HIGH) must not be longer than tCMS of 15 us.

Notes:

1. PSRAM uses DRAM cell which needs a REFRESH action periodically to retain the information. This REFRESH action is performed only when the device is not selected (Chip Select Pins are Disabled). A hidden REFRESH action has to be executed by the device at least once every 15 µs of tCSM.

2. Figure 3a shows a timing example in which consecutive READ cycles for more than 15 us . This timing should be avoided for proper REFRESH operation.
REFRESH operation can begin only during Chip Select pins are Disabled (CS1# is High and CS2 is Low) for more than 5ns. Example on how to avoid tCSM violation in Figure 3a is shown in Figure 3b.

3. Figure 4a shows a timing example in which a single WRITE operation is maintained for a period greater than 15 µs. Since a proper REFRESH action cannot be performed during device is selected by Chip Select pins, information stored in the device will not be retained if this timing occurs.

   Figure 4b is a timing example of using CS1# signal toggling for proper the WRITE operation
