

**IXYS**  
A Littelfuse Technology

# Power Semiconductor 2020 - 2021 Product Catalog

A guide to selecting the right power semiconductor for your applications

Littelfuse products are vital components in applications that use electrical energy, from consumer electronics to vehicles and industrial facilities. Our history of innovation and technical expertise enable us to provide objective, comprehensive, and personalized customer solutions.

In 2018, Littelfuse acquired IXYS Corporation and created the IXYS: A Littelfuse brand, which represents the company's comprehensive portfolio of advanced semiconductor technologies, including silicon carbide and wide band gap solutions in discrete and module packages. These power semiconductor products make up the broadest portfolios used by power electronics design engineers today, covering rectifiers, fast diodes, MOSFETs, IGBTs, SSRs, and thyristors at various ratings and outlines and in integrated power modules with the necessary driver IC devices.

IXYS: A Littelfuse Technology provides a core platform for serving a wide range of applications to improve power conversion efficiency, generate clean energy, power and communications networks, control motors, facilitate automation, improve industrial equipment, and electrify transportation from bikes to cars to buses to trains to ships. Littelfuse power semiconductors are relied upon in the most strenuous environments on the planet.

From a technology standpoint, the integration of IXYS and Littelfuse portfolios creates a rare broadbase supplier of high quality power semiconductors. Not only has Littelfuse taken steps, such as its IXYS acquisition, to reinforce its footprint in the power semiconductor industry, it has also invested heavily in the development and commercialization of emerging technologies such as silicon carbide. In 2015, Littelfuse invested in and later acquired Monolith Semiconductor Inc., a Texas-based startup company developing silicon carbide power devices for broad application use. This technology adds another key option for power electronics designers to optimize designs for energy efficiency, power density, and reduced system level costs.

Littelfuse boasts a proud track record of customer satisfaction, manufacturing excellence, and stable growth; much of which can be traced to deep roots as a world leader in intellectual property protection. Having the determination to integrate such important capabilities in semiconductor technology demonstrates why Littelfuse is, and will continue to be, an industry innovator and high service supplier for its power electronics customers.

High Voltage TO-252 / 205 / 208 / 247 & ISO247 package	2
<b>New TO-247-4L package</b>	<b>7</b>
<b>ISOPLUS™ family</b>	<b>8</b>
ISOPLUS-SMPD™	9
ISOPLUS-DIL™ / ISOPLUS i4-PAC™	14
<b>IGBT Discretes</b>	<b>17</b>
Ignition IGBTs and Relevant Peripheral Components	20
600V / 650V / 900V / 1700V & 2500V XPT™	22
1200V XPT™ / X2PT™ / NPT / PT IGBTs	28
High Voltage Types 1700V up to 4500V	30
BiMOSFETs (reverse conducting) 1600V up to 3600V	32
<b>IGBT Modules</b>	<b>34</b>
Phase Leg / CBI Modules	34
6-Pack Modules	36
Half Bridge and Boost Modules in SimBus F Housing	38
Full Bridge and Brake / Buck / Boost Modules	39
Half Bridge Modules in 34/62mm housings	40
<b>Power MOSFETs</b>	<b>41</b>
Trench MOSFETs / HiPerFETs (Fast Body Diode)	43
TrenchT2™ / T3™ / T4™ MOSFETs / HiPerFETs (FBD)	45
Polar™ MOSFETs / HiPerFETs (FBD)	48
PolarP2™ / P3™ MOSFETs / HiPerFETs (FBD)	54
X4, X3, X2 & X-Class Ultra Junction Power MOSFETs	56
Q3-Class HiPerFET (Fast Body Diode)	63
Very High Voltage (up to 4700V) / Legacy MOSFETs	64
Linear L2™ Power MOSFETs	66
Depletion-Mode MOSFETs (normally on)	67
PolarP™ and TrenchP™ P-channel MOSFETs	68
Superjunction Power MOSFETs	70
SiC MOSFETs and SiC Schottky Diodes	71
MOSFET Modules	74
Power Factor Correction Modules	75
<b>Diodes</b>	<b>76</b>
Schottky Gen <sup>2</sup> Diodes	77
Schottky Diodes	79
HiPerDyn™ FREDs & Dual Ultrafast Diodes	80
HiPerFRED2™ & HiPerFRED™ Diodes	81
SONIC-FRD™ Diodes	83
FRED Diodes	84
FRED & HiPerFRED™ Modules & Semifast Diodes	86
Rectifier & Avalanche Types	87
Studs: Rectifier & Avalanche Diodes & Thyristors	89
Rectifier Diode Modules	94, 177

$C_{oes}, C_{oss}$	Output capacitance	$I_G, I_{GT}$	Trigger gate current
$C_{res}, C_{rss}$	Reverse transfer (Miller) capacitance	$I_{GD}$	Non-trigger gate current
<b>d</b>	Duty cycle	$I_{GES}$	Gate emitter leakage current
$d_A$	Strike distance through air	$I_H$	Holding current
<b>di/dt, -di/dt</b>	Rate of change of current	$I_{IN(H)}$	Signal input current (high level)
<b>(di/dt)<sub>cr</sub></b>	Critical rate of rise of current	$I_{IN(L)}$	Signal input current (low level)
$di_F/dt, -di_F/dt$	Rate of change of forward current	$I_{ISOL}$	RMS current for isolation test
$d_s$	Creep distance on surface	$I_L$	Latching current
<b>dv/dt</b>	Rate of rise of voltage	$I_R$	Reverse current
<b>(dv/dt)<sub>cr</sub></b>	Critical rate of rise of voltage	$I_{RM}$	Maximum reverse recovery current
$E_{AR}$	Repetitive avalanche energy	$I_{RMS}$	RMS current
$E_{AS}$	Non-repetitive avalanche energy	$I_{RRM}$	Maximum repetitive reverse current
$E_{off}$	Turn-off energy per pulse	$I_S$	Continuous source current
$E_{on}$	Turn-on energy per pulse	$I_{SM}$	Maximum pulsed source current
$E_{rec(off)}$	Reverse recovery losses at turn-off	$I^2t$	I <sup>2</sup> t value for fusing
$F_{(mounting)}$	Required force to mount hole-less discretes on heat sink	$I_{TSM}$	Maximum surge on-state current
$g_{fs}$	Forward transconductance	$K_f$	Characteristic factor
$I_{AR}$	Repetitive avalanche current	$K_p$	Coeff. for energy per pulse E <sub>p</sub>
$I_{AVM}$	Maximum average forward current	$K_T$	Temperature coefficient of V <sub>BC</sub>
$I_{BO}$	Breakover current	<b>L</b>	Series stray inductance
$I_{C(on)}$	Short circuit current	$M_d$	Mounting torque
$I_C$	Collector current	$P_C$	Collector power dissipation
$I_{C25}$	Continuous DC collector current at T <sub>C</sub> = 25°C	$P_D$	Power dissipation
$I_{C90}$	Continuous DC collector current at T <sub>C</sub> = 90°C	$P_{GAV}$	Average gate power dissipation
$I_{CES}$	Collector emitter leakage current	$P_{G(AV)M}$	Maximum average gate power
$I_{CM}$	Maximum pulsed collector current	$P_{GM}$	Maximum gate power dissipation
$I_D$	Drain current	$P_{RSM}$	Maximum surge reverse power
$I_{DD}$	Module supply current, operating mode	$P_T, P_{tot}$	Total power dissipation
$I_{DD0}$	Module supply current, standby mode	$Q_g$	Total gate charge
$I_{D(cont)}$	Continuous drain current	$Q_{gc}$	Gate collector (Miller) charge
$I_{D25}$	Continuous drain current at T <sub>C</sub> = 25°C	$Q_{gd}$	Gate drain (Miller) charge
$I_{DAV}$	Average DC output current	$Q_{ge}$	Gate emitter charge
$I_{D(AV)M}$	Maximum average DC output current	$Q_{gs}$	Gate source charge
$I_{DM}$	Maximum pulsed drain current	$Q_r$	Reverse recovery charge
$I_{DRM}$	Maximum repetitive off-state current	$Q_{RM}$	Reverse recovery charge (intrinsic)
$I_{D(RMS)}$	RMS output current	$Q_s$	Recovered charge to IRM
$I_{DSS}$	Drain source leakage current	<b>RBSOA</b>	Reverse Bias Safe Operating Area
$I_F, I_T$	Forward current	$R_{DS(on)}$	Static drain source on resistance
$I_{FM}$	Maximum forward current		

$R_{thJC}$	Thermal resistance junction to case
$R_{thJK}^?$ , $R_{thJH}$	Thermal resistance junction to heatsink
$R_{thJS}$	Thermal resistance junction to heatsink
$R_{thJW}$	Thermal resistance junction to water
$R_{thKA}$	Thermal resistance heatsink to ambient
<b>SCSOA</b>	Short Circuit Safe Operating Area
$T_{amb}$ , $T_A$	Ambient (cooling medium) temperature
$T_C$ , $T_{case}$	Case temperature
$t_{d(off)}$	Turn-off delay time
$t_{d(on)}$	Turn-on delay time
$t_{fl}$	Current fall time (inductive load)
$t_{fr}$	Forward recovery time
$t_{FLT}$	Overcurrent or short circuit trip delay time
$t_{gd}$	Gate controlled delay time
$T_J$ , $T_{VJ}$	Virtual junction temperature
$T_{JM}^?$ , $T_{VJM}$	Maximum virtual junction temperature
$T_K$ , $T_H$ , $T_S$	Heatsink temperature
$T_L$	Lead temperature
$T_{S(max)}$	Maximum allowable heatsink temperature
$T_{stg}$	Storage temperature
$t_P$	Pulse time
$t_q$	Turn-off time
$t_r$	Current rise time
$t_{rr}$	Reverse recovery time
$t_{rv}$	Rise time of collector emitter voltage
$t_{SC}$	Short circuit duration
$V_{BO}$	Breakover voltage
$V_{CE}$	Collector emitter voltage
$V_{CE(sat)}$	Collector emitter saturation voltage
$V_{CE(sat)FLT}$	Collector emitter saturation voltage to indicate fault
$V_{CEK}$	Collector emitter clamp voltage on chip level
$V_{CES}$	Collector emitter voltage
$V_{CGR}$	Collector gate voltage
$V_{DD}$	Module supply voltage
$V_{DD FLT}$	Module supply voltage without fault
$V_{DGR}$	Drain gate voltage
$V_{DRM}$	Maximum repetitive forward blocking voltage
$V_{DS}$	Drain source voltage
$V_{DSM}$	Max. non-repetitive forward blocking voltage
$V_{DSS}$	Drain source breakdown voltage

$V_{GE(th)}$	Gate emitter threshold voltage
$V_{GEM}$	Maximum transient collector gate voltage
$V_{GES}$	Maximum DC gate voltage
$V_{GS}$	Gate source voltage
$V_{GS(th)}$	Gate threshold voltage
$V_{GSM}$	Maximum transient gate source voltage
$V_{GT}$	Gate trigger voltage
$V_H$	Holding voltage
$V_{IN}$	Input control voltage
$V_{IN(H)}$	Input voltage threshold for IGBT
$V_{IN(L)}$	Input voltage threshold for IGBT
$V_{ISOL}$	Isolation voltage
$V_R$	Reverse voltage
$V_{RES}$	Input voltage threshold for Resistor
$V_{RGM}$	Maximum reverse gate voltage
$V_{RRM}$	Maximum repetitive reverse voltage
$V_{RSM}$	Maximum non-repetitive reverse voltage
$V_{SD}$	Forward voltage drop
$V_T$	Forward voltage
$V_{TO}$	Threshold voltage (for power loss)
$Z_{thJC}$	Transient thermal impedance junction to case
$Z_{thJK}^?$ , $Z_{thJH}$	Transient thermal impedance junction to heatsink

### Note

As far as patents or other rights of third parties are concerned, this specification is only assumed for components per se, not for applications and circuits implemented with components or assemblies. This specification describes the type of component and shall not be taken as assured characteristics.

Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings or maximum ratings of the device at these or at any other conditions above the limiting values. The characteristics sections of the specification is not intended for limiting values for extended periods may affect device reliability. Delivery and rights to change design or specifications are reserved. Changes have been made to earlier published specifications. This specification herein supersedes all previously published information.

### Life support applications

IXYS products used in life support appliances, devices, or systems, where malfunction of these products can reasonably be expected to result in personal injury must be expressly authorized.

**Package**

**3/4" stud glass/metal**

- 3/4" stud ceramic
- 3/4" HV ceramic stud with lug
- 3/4" HV ceramic stud

**1/2" ceramic stud**

- 1/2" ceramic stud with flag
- M12 stud ceramic with lug

**3/8" stud ceramic**

- M20 stud ceramic with lug & gate leads

**Voltage grade -  $V_{RRM}, V_{DRM}/100$**

$t_q$  code - See table for relevant code

All IXYS UK stud devices are available with or without leads, sleeving and nuts.

Please add one of the following three-letter code options are required, to the end of the part number.

000 - Leaded stud, no sleeving, no nuts and washers

S0L - Leaded stud, with standard\* sleeving, nuts and washers supplied loose

00L - Leaded stud, no sleeving, nuts and washers supplied

NLL - Non-leaded stud, nuts and washers supplied (Applies also to devices with flag/tag terminals)

S0F - Leaded stud, with standard\* sleeving, nuts and washers supplied

00F - Leaded stud, no sleeving, nuts and washers supplied

NLF - Non-leaded stud, nuts and washers fitted (Applies also to devices with flag/tag terminals)

S00 - Leaded stud, with standard\* sleeving, nuts and washers supplied

NLS - Non-leaded stud, no nuts and washers supplied (Applies also to devices with flag/tag terminals)

\* - Standard sleeving means the following:  
 Red for all thyristor studs  
 Blue for 'S' polarity diode studs  
 Red for 'R' polarity diode studs

Example 1	M	I	X	G	120	W		1200	DPF	T	E

T	Thermistor	TUB	Tube

- simplified process
- reduced mounting time
- no risk of bad solder contacts
- reduced aging of pin contact
- no thermal stress for the PCB assembly
- press out possible for maintenance

The pin concept is based on the proven „Bizon“-Pin concept.

Pressing process is a plastic deformation of pin and via of the board ending in a cold welding

Pin features are:

- Pin concept based on successfully proven „Bizon“-Pin concept
- Pin qualification according to IEC 60352-5
- High conductive Cu alloy with Ni / gal. Tin surface
- Very low contact resistance
- Low press-in force per pin and PCB hole diameter independent press-out force
- Press-Fit-Pin usable for PCB's designed for competitor devices

### Started with the following modules types:

Pin configuration see Data Sheets

Board and Via Requirements E2 and E3			
	min.	typical	max.
Drill hole diameter		2.35 mm	
Final hole diameter	2.14 mm	2.20 mm	2.29 mm
Cu thickness inside the hole	>25 $\mu$ m		
Sn thickness inside the hole			<15 $\mu$ m
Cu thickness for PCB tracks	35 $\mu$ m	70 $\mu$ m 105 $\mu$ m	
PCB thickness	1.60 mm	2.00 mm	
Metallization PCB	chem. Tin		
Board and Via Requirements SimBus F			
	min.	typical	max.
Drill hole diameter		1.16 mm	
Final hole diameter	1.00 mm	1.05 mm	1.10 mm
Cu thickness inside the hole	>25 $\mu$ m		
Sn thickness inside the hole			<15 $\mu$ m
Cu thickness for PCB tracks	35 $\mu$ m	70 $\mu$ m 105 $\mu$ m	
PCB thickness	1.60 mm	2.00 mm	
Metallization PCB	chem. Tin

# Isolated Discrete Packages

ISOPLUS247™ is the DCB isolated version of the PLUS247™ package (TO-247 without a mounting hole). The design of this patented package is revolutionary: the silicon chip is soft soldered onto a Direct Copper Bond (DCB) substrate instead of the usual copper lead frame. The DCB ceramic, the same substrate material as used in the high power modules, not only provides high isolation capability (2500 V<sub>RMS</sub>) but also unbeatable low thermal resistance compared to conventional, externally mounted isolation materials.

## Advantages:

- Isolation capability from leads to backside 2500 V<sub>RMS</sub> – no external isolation foil needed
- Thermal resistance from Junction to Case only slightly higher as for non-isolated version
- Increased power- and temperature cycling capability
- DCB can be patterned like printed circuit boards – allowing special functions to be realized

types available.

Another interesting feature is the ability to pattern the DCB like a printed circuit board. This allows special functions can be realized, like the **series connection** of multiple chips within one package.

**ISOPLUS220™**, **ISOPLUS247™**, **ISOPLUS264™** are suitable for the corresponding packages.

A larger version of this technology is medium power **ISOPLUS-DIL™** which has up to five terminal pins. It is possible to build up full diode bridge, se-leg transistor converter and boost converters within one isolated device.

**ISOPLUS-DIL™** 37.5 mm wide provides the largest area within the ISOPLUS™ family. It is available in 2 pin output configuration with plate current up to 300 A RMS on one side and 300 A on the opposite side. The package is internally cooled. It is suitable for low voltage (< 200 V) either as single switch or as full bridge. The highest power density ISOPLUS-DIL™ is suitable for the use in automotive applications.

**ISOPLUS-SMPD™** is a special version of IXYS ISOPLUS™ family. It offers an increased creepage distance between pins to DCB (> 1 mm).

SMPD-B

## Package cross section

While the junction-to-case thermal resistance is higher than an equivalent, non-isolated device, what really matters is the total thermal resistance from junction-to-heatsink ( $R_{thJH}$ ). Comparing a device in ISOPLUS247™ to its companion in the non-isolated package with an external isolation foil, one can see that the overall  $R_{th}$  is now lower for the part in the already isolated package (see example).

Due to the matched thermal expansion coefficients of silicon and DCB ceramic, mechanical stress to the die and solder caused by power and temperature

cycling is reduced so that reliability is improved. Mounting is done with clips, which not only saves time but also guarantees constant pressure force over the whole lifetime of the assembly.

Parts in the **ISOPLUS247™** housing can be identified by the letter "R" in the IXYS part number. Potentially all devices now encapsulated in TO-247, TO-264 and PLUS247™ housings can be molded in the ISOPLUS247™. There are already more than 100 different ISOPLUS247™

## Example: ISOPLUS247™ compared to conventional isolated device

Type	Package	Isolation	$R_{thJC}$ K/W	$R_{thCK}$ K/W	Total K/W	Factor
IXFR 180N10	ISOPLUS247™	internal DCB	0.3	0.15	0.45	1
IXFX 180N10	PLUS247™	external foil	0.22	1.02	1.24	2.8

ISOPLUS-SMPD™ package is the key to making designer's life easier as it provides a device featuring:

- 2.5 kV isolation to heatsink (UL rating)
- low thermal impedance for good cooling by only 0.38 mm thick ceramic
- more than 4 mm creepage distance from pin to mounting surface
- up to 7 mm creepage from pin to pin (depending on package type)
- high integration such as phase leg or 3~ input rectifier in one package
- automatic mounting by pick & place possible (packaged in Tape & Reel)

This enables the engineer to make flat designs with a concept of distributed power dissipation. The latter is achieved by the elimination of heatsinks with a thinner base reducing weight and cost.

The new ISOPLUS-SMPD™ package is small and light weight with two rows of pins, resembling an SMD assembly to the board in standard SMD pick & place equipment. Together with other standard SMD components, ISOPLUS-SMPD™ devices are available in Tape & Reel or in a Blister Tray option.

The complete board including the power components can run through a standard SMD soldering process.

Two types are available, ISOPLUS-SMPD™-B (Fig. 1) is optimized for implementing more complex topologies like phase-legs, buck and boost chopper as well as single – or 3-phase input rectifier bridges, which can be used as building blocks for inverters. ISOPLUS-SMPD™-X (Fig. 2) with a larger number of pins on either side allows the integration of large dies for very high current capability up to 600 A per unit.

Fig. 1 SMPD-B

Fig. 2 SMPD-X

Both designs benefit from the ISOPLUS™ construction with low mechanical stress for the die because of the close match in the thermal expansion coefficient of die and DCB resulting in long term reliability.

As normal these devices require a layer of thermal interface material (heat transfer paste) to be applied to the backside of the power devices (or to the heat sink surface). Then the devices can be mounted together with the PCB. These power devices need to be pressed down to the heat sink to achieve low thermal resistances. Pressure can be applied in different ways, for example using a mounting clip or a post, applying pressure directly to the power device (see Fig. 3 and Fig. 4).

Fig. 3 Mounting example

The high package flexibility allows to offer

- high current single Trench MOSFET
- high current single IGBT
- buck and boost converters
- phase-legs with desaturation diodes for switch control
- 1~ or 3~ input rectifiers
- multiple boost stages
- cascade configurations

Customer specific designs are feasible.

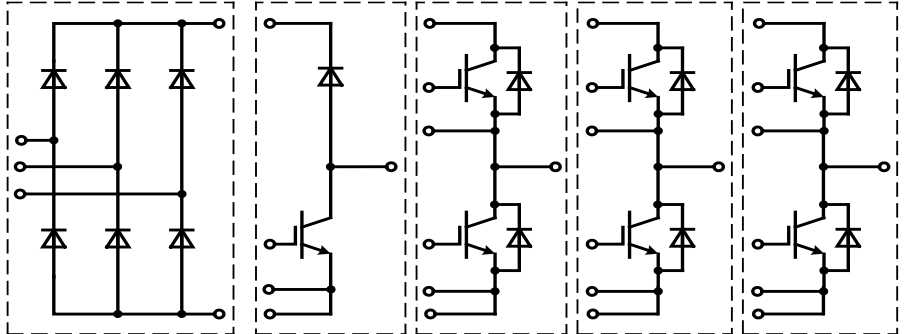

Fig. 4 Mounting example

- 2500 V UL rated electrical isolation
- low thermal resistance
- increased power & temperature cycling
- saves space

- replaces multiple discretes
- reduces parasitic inductance & c
- reduces EMI
- heat spreading

vice versa. Low switching speed versions are often combined with low  $V_{CE(sat)}$  for low frequency applications. High switching speed versions tend to have higher  $V_{CE(sat)}$ .

**Temperature Coefficient** – this determines the device  $V_{CE(sat)}$  trend against temperature. A device is said to have a positive temperature coefficient if the  $V_{CE(sat)}$  rises when the junction temperature increases. Likewise a negative temperature coefficient is when the device's  $V_{CE(sat)}$  reduces when the junction temperature increases. A positive temperature coefficient device can be operated in parallel. A negative temperature coefficient device cannot be operated in parallel but may have higher temperatures.

**Safe Operating Area (SOA)** – the ability for an IGBT to sustain voltage and current in shorter time scales without reverse bias (FBSOA) is SOA when turning the IGBT into the on-state. Reverse Bias (RBSOA) is SOA when turning to the off-state. Circuit SOA (SCSOA) is an indication of ability to withstand surge currents in operation.

**Avalanche Rated** – the ruggedness of the IGBT in the avalanche region. An avalanche rated device is far more alternative devices during operation and is an indication of reliability.

Drive and solar inverters.

### **Xtreme Light Punch Through (X2PT™) Planar IGBTs**

are the second generation of XPT IGBTs. Features are 10  $\mu$ s short circuit capability, 175°C max junction temperature, further reduced  $V_{CE(sat)}$  and lower turn-off losses ( $E_{off}$ ) resulting in a competitive performance to later generations at reduced  $R_{th}$ . Thus they are ideally suited for Motor Drive inverters.

### **Xtreme Light Punch Through (XPT™) Trench IGBTs**

are the latest development from IXYS starting at 650 V. This range features not only a low  $V_{CE(sat)}$  and low switching losses making the platform attractive for fast switching applications whilst retaining good thermal stability, a positive temperature coefficient. Either discrete or co-packaged with ultrafast soft recovery Sonic diodes. IGBTs have industry leading efficiency at medium to high switching frequency.

### **1600 V & 1700 V Low Sat IGBTs**

These rugged High Voltage NPT devices are designed for capacitor discharge applications. featuring high voltage, high power density & high peak current capability. These High Voltage NPT IGBTs enable the designer to replace costly, lower performance solutions such as thyristors or series connected MOSFETs or IGBTs types used in applications above 1200 V. Offered as co-packs, they provide a more complete solution for power conversion.

### **1600 V & 1700 V High Speed IGBTs**

This family of 1600/1700 V IGBTs are rugged NPT devices targeted for high voltage applications requiring high short circuit withstand capability. They are particularly suitable for high voltage switching applications. In addition, its fast switching "A" version 1700 V NPT IGBTs in co-pack and phase-leg configurations for PWM applications with switching frequencies upwards of 50 kHz.

### **Very High Voltage (2500 V - 4000 V) IGBTs**

IXYS' offers a unique portfolio of discrete 2500 V, 3000 V and 4000 V VHV IGBTs with collector current ratings from 2 A to 75 A ( $T_c = 110^\circ\text{C}$ ). The voltage and current ratings of these devices, coupled with their simple gate-control, allow the system designer to greatly reduce the complexity of many high voltage switching applications. These IGBTs enable the use of a single device in systems whose circuits previously used multiple, high voltage switches.

### **B-series (BiMOSFET) IGBTs**

IXYS BiMOSFETs are devices which have combined strengths of MOSFETs and IGBTs. BiMOSFETs feature a monolithic intrinsic diode which can reduce die count in many applications.

### Trench and Trench2 Power MOSFETs

IXYS Trench Power MOSFETs are ideally suited for low-voltage, high-current applications. These MOSFETs feature an unusually low  $R_{DS(on)}$ , thus guaranteeing low power dissipation. Trench HiPerFET™ versions feature all of the advantages of IXYS' Trench Standard Power MOSFETs with an added benefit of a fast intrinsic rectifier which provides low reverse charge ( $Q_{rr}$ ) and excellent commutating  $dV/dt$  ratings for enhanced power switching capabilities and device ruggedness.

### Polar™ Power MOSFETs

Polar™ MOSFETs (IXT..) feature a proprietary cell design and process that has resulted in a MOSFET with a significantly lower  $R_{DS(on)}$  per unit area along with a decrease in gate charge. IXYS has also reduced the wafer thickness, which substantially reduces the thermal resistance. The combination of lower  $R_{DS(on)}$ , lower gate charge  $Q_g$  and higher power dissipation capability has resulted in a new class of MOSFETs, which will increase the cost effectiveness in switch mode power supply (SMPS) applications. IXYS' Polar™ HiPerFETs™ (IXF..) combine the strengths of the Polar Standard product family with a faster body diode reverse recovery time ( $t_{rr}$ ) is reduced to make them suitable for phase-shift bridges, motor control and uninterruptible power supply applications (UPS). This family of HiPerFETs™ provide lowest  $R_{DS(on)}$ , low  $R_{thJC}$ , low  $Q_g$ , and enhanced  $DV/DT$  capability.

### PolarP2™ Power MOSFETs

PolarP2™ devices are an optimized range of the standard Polar platform for 500V device rating.

### PolarP3™ HiPerFET™ Power MOSFETs

The PolarP3™ HiPerFET™ product family is the latest addition to IXYS' benchmark high-performance Polar Standard product family for our product portfolio between 500V and 600V. Its high Figure of Merit (FOM) being the multiplication of  $Q_g$  and  $R_{DS(on)}$  makes it an excellent alternative to weaker super junction technologies. All IXYS Polar MOSFETs are tested 100% for reliability and ruggedness.

### X-Class Power MOSFETs

These devices are developed using a charge compensation principle and proprietary process technology, resulting in MOSFETs with significantly reduced resistance  $R_{DS(on)}$  and gate charge  $Q_g$ . They also exhibit a superior  $dV/dt$  rating. Designed for such applications as switched-mode and resonant-mode power supplies, DC-DC converters, PFC, DC motor drives, and robotic and servo control, these MOSFETs enable higher efficiency, along with high power density and system performance. The X2-Class Power MOSFETs, devices with fast body diodes and avalanche ratings, are also available.

### Q3-Class HiPerFET™ MOSFETs

Q3-Class HiPerFET™ MOSFETs (Identified by the suffix letter Q3) is the direct result of a revolutionary new cell design that decreases the MOSFETs total gate charge ( $Q_g$ ) and the Miller capacitance ( $C_{rss}$ ), while maintaining the ruggedness of the switching intrinsic diode of the company's current HiPerFET™ product line. The result is a MOSFET with dramatic improvements in switching efficiencies and thus enabling higher frequency operation and smaller power supplies.

bias safe operating area" (FBSOA) capability to overcome the limitations posed by conventional power MOSFETs in the current saturation region. These extended FBSOA Power MOSFETs are not intended for high speed switching

### **Depletion-Mode MOSFET**

Depletion-Mode Power MOSFETs operate in a 'normally-on' mode, not requiring energy or gate voltage for turn-on. In regular enhancement type MOSFETs these Depletion-Mode MOSFETs require a negative gate bias to turn off. They remain on at or above zero gate bias voltage but otherwise have similar MOSFET characteristics. The "normally-on" mode of these devices combined with an enhanced linear operating capability allows for an ideal device selection for current sources, current regulators, solid-state relays, level shifting, active loads, start-up circuits and active power filters. Since they require no energy or gate voltage for turn-on, high energy efficiency can be achieved through device implementation in "normally on" load switch applications. With the high degree of current regulation, these devices can also act as current sources with high dynamic impedance in power filter applications to limit voltage and current noise and spikes. Furthermore, they can provide active circuit protection to limit the surge of current during short-circuit or overload conditions.

### **PolarP™ P-Channel Power MOSFETs**

IXYS' Polar technology platform employed in our PolarP™ P-Channel MOSFETs utilizes a proprietary cell design for overall device efficiency and performance. This technology platform reduces on-state resistance by as much as 40% compared to legacy counterparts. With such low on-state resistances, these devices offer low conduction losses while a low input capacitance. The combination of low  $R_{DS(on)}$  and gate charge allow for improved switching performance. These P-Channel MOSFETs are dynamic dV/dt and avalanche rated making them extremely rugged in demanding environments and can easily be paralleled due to an on-state resistance with a positive temperature coefficient. They are suitable for 'high side' switching where a simple drive circuit referenced to ground can be used, circumventing additional 'high side' driver circuitry commonly involved when using an N-Channel MOSFET. This will help designers to reduce component count and improve reliability. Furthermore it allows for the design of a complementary power output stage. with a corresponding IXYS N-Channel MOSFET for a power half bridge stage with a simple drive circuit.

### **TrenchP™ P-Channel Power MOSFETs**

This family of P-Channel devices benefit from technological advances derived from IXYS' robust Trench cell technology implemented in their wide portfolio of industry recognized power devices. They feature an ultra low  $R_{DS(on)}$ , minimizing conduction losses and promoting improved operating and thermal efficiencies. These TrenchP™ P-Channel MOSFETs are suitable for 'high side' switching where a simple drive circuit referenced to ground can be employed, circumventing additional 'high side' driver circuitry commonly involved when using an N-Channel MOSFET. This enables designers to reduce component count, improving drive circuit simplicity and cost structure. Furthermore it allows for the design of a complementary power output stage with a corresponding IXYS N-Channel MOSFET, for a power half bridge stage with a simple drive circuit. Conduction losses that will greatly benefit from these devices include high side switching, high current regulators, DC Choppers, DC amplifiers, push-pull amplifiers and power solid state relays.

### **Very High Voltage Power MOSFETs**

IXYS' VHV N-Channel Power MOSFETs are specifically designed to address demanding, fast-switching applications with switching capabilities of 2.5kV to 4.5kV. These VHV Power MOSFETs are also ideally suited for parallel operation due to the low temperature coefficient of their on-state resistance. Parallel operation with these devices provides a more cost-effective solution than employing series-connected, lower-voltage MOSFETs. The reduction or replacement of multiple series-connected devices and the associated gate drive circuitry commonly involved, simplifies design, improves reliability and reduces overall system cost. These VHV MOSFETs represent an optimal solution in applications such as laser and x-ray generation systems, power supplies, pulse circuits, high voltage automated test equipment and capacitor discharge circuits. 4.5kV devices feature high isolation capability with superior thermal performance.

## 3-phase PFC

### “Vienna Rectifier” circuit

- wide input voltage range
- sinusoidal mains input currents in phase with mains
- boost converter operation:
  - input: 3~ AC mains without neutral conductor
  - output: stabilized DC link with center point
- one module used per phase

only as good as their associated free-wheeling diodes. At increasing switching frequencies, the proper functioning and efficiency of the power switch, aside from conduction losses, is determined by the turn-off behavior of the diode (characterized by  $Q_r$ ,  $I_{RM}$  and  $t_{rr}$  - Fig. 1). With optimized ultra-fast switching diodes, the development engineer has various possibilities: either higher pulse rate or higher current load or smaller heatsink or more conservative operation due to „cooler“ chips.

The reverse current characteristic following the peak reverse current  $I_{RM}$  is another very important property. The slope of the decaying reverse current  $di_r/dt$  results from design parameters (technology and diffusion of the diode chips). In a circuit this current slope, in conjunction with parasitic inductances (e.g. connecting leads), causes over-voltage spikes and high frequency interference voltages. The higher the

blocking voltages makes it possible to apply these diodes as output rectifiers in switch-mode power supplies (SMPS) as well as protective and free-wheeling diodes for power switches in inverters.

## Diodes for General Purpose Applications

### Rectifier Diodes

Diodes of the DS-series (anode on stud) and of the DSI-series (cathode on stud) are mainly used for rectifying 50 or 60 Hz mains currents. Discrete diodes in plastic and metal housings and also different diode bridges are available for standard line voltages (from 110 V to 690 V AC).

### Avalanche Diodes

Avalanche diodes or surge-voltage-proof rectifier diodes of the series DSA (anode on stud) and DSAI (cathode on stud) differ from standard diodes of the series DS and DSI in the following

control of the avalanche is important to ensure doping of the middle zone of the chip and suitable junction and passivation at the PN-junctions are exposed surface (high field strength). Because of this ruggedness, periodically occurring surge surges in the blocking state frequently can do without overvoltage net-work. avalanche diodes are used in high voltage applications. avalanche breakdown characteristic ensure dynamic voltage distribution across each device. The none of the series are overstressed by reverse voltage. All high voltage modules manufactured are assembled with avalanche

kes possible the mount-down of any number of the same or different modules on a common heatsink. It is feasible to use standard housings with appropriate accessories for designing compact power converter operating from AC mains up to 690 V.

## Plastic Housing with DCB Substrate

IXYS has succeeded in simplifying the conventional multilayer module construction by the DCB (Direct Copper Bonding) technique.

Other features are:

- top-side electrical terminals with captured nuts;
- series-connected diode/diode, thyristor/ diode and thyristor/thyristor modules;
- easy assembly.

All thyristor modules with DCB ceramic base contacts are available in

ting screws available on request). The module housing is designed for adequate clearance and creepage distance resulting in  recognition by Underwriters Laboratories, Inc., USA for all types.

## New Generation Silicon Chips

All chips are designed by applying separation diffusion processes such that the zones responsible for the surface field strength are located at the upper chip side. This results in the capability of soldering the entire chip area onto the DCB ceramic substrate without a molybdenum strain buffer, which in turn leads to good stability of the chips as well as to large area heat dissipation if a load is applied. All zones at the edges which are decisive for the blocking stability are coated with passivation glasses the coefficient of expansion of which match that of silicon. Silicon chips increasingly use planar technology with guard rings and channel stoppers to reduce electrical surface fields. This chip design supercedes

- of the chips possess deposited metal layers, the improved properties,
  - Excellent long-term blocking currents and stages,
  - increased life time of soldered connections
  - high power cycles ( $\geq 50\ 000$ ).
- The thyristor/diode optimized with regard off parameters: decreased lifetime results in charges QS, which significantly reduces required snubbers for overvoltage. Cost reduction efficiency are the key characteristics. By replacing silicon chips, improved firing characteristics by specifying a high "not to fire" IGD result in less susceptible. This leads to greater operation and higher equipment.

Fig. 1: Principal cross section of an IXYS module with DCB technology

See data sheet for pin

Type **ZY 180 R** (R = Right for pin pair 6/7)

For module-type TO-240 package MCC/MCD/  
MCMA/MCNA 19 up to 120 and 140 (version 1):  
Keyed Gate Cathode twin plugs with wire  
length = 340 / 460 mm;  
gate = white, cathode = red

Type **ZY 200 L** (L = Left for pin pair 4/5)

Type **ZY 200 R** (R = Right for pin pair 6/7)

For ZY 180 and ZY 200: UL 758 Style 3751

For module types MCC/MCD/MDD 310  
Threaded spacer for higher Anode /  
Cathode construction:

Type **ZY 250** (material brass)

**Not for new design**

## Design Information

For Thyristors, Diodes, Thyristor / Diode Modules and Rectifier Bridges

### Surge current

The 60 Hz value of  $I_{TSM}$  is 10% higher than the 50 Hz value  
The  $I_{TSM}$  value at  $T_{VJM}$  is 10% to 15% lower than the 45°C value

### Limiting $Pt$

50 Hz:  $I^2t [A^2s] = I_{TSM} [A] \cdot I_{TSM} [A] \cdot 0.005 [s]$ ; use rated  $I_{TSM}$  value (10 ms)  
60 Hz:  $I^2t [A^2s] = I_{TSM} [A] \cdot I_{TSM} [A] \cdot 0.0042 [s]$ ; use 60-Hz-value of  $I_{TSM}$

### Forward current

The average current ratings in tables are mostly specified for temperature  
conditions of:  $T_A = 45^\circ C$ ,  $T_C = 85^\circ C$  or  $T_C = 100^\circ C$ .

For other temperature conditions the current ratings can be calculated using  
following formulas applicable up to 400 Hz.

$$I_{TAV} = \frac{-V_{TO} + \sqrt{V_{TO}^2 + 4 \cdot k^2 \cdot r_T \cdot P}}{2 \cdot k^2 \cdot r_T}$$

where

$$P = \frac{T_{VJM} - T_C}{R_{thJC}} \quad \text{or} \quad P = \dots$$

$$I_{TAV} [A], P [W]; V_{TO} [V]; r_T [\Omega], T_{VJM} [^\circ C], T_C [^\circ C], T_A [^\circ C], R_{thJC} [K/W], R_{thJA} [K/W]$$

$k^2 = 1$  for DC current

$k^2 = 2.5$  for sinusoidal half wave current

$k^2 = 3$  for 120° rectangular current

$k^2 = 6$  for 60° rectangular current

The average forward current is limited by the RMS current value  $I_{T(RMS)}$ .  
When the **calculated** value  $I_{TAV}$  is higher than  $I_{T(RMS)} / k$ , replace it by  $I_{TAV} = I_{T(RMS)} / k$

## Rectifier Bridges incorporating Fast Diodes

Power switching semiconductors are used in inverter systems with DC-Link. Due to high switching frequencies, harmonics and line distortion may be generated. It is important that the new designs reduce these influences and fulfill the EMI filtering requirements according to EMI/EMC VDE 0871 and other.

The noise level can be reduced by up to **10dB** when the input rectifier is equipped with semi-fast diodes and is therefore optimised for turn off; resulting in a lower peak recovery current compared to non-optimised and normal rectifier diodes.

The noise level can be further reduced approximately **5dB** when using rectifier bridges equipped with Epitaxial Diodes (FRED) like module types VUE (three phase bridge) or VUE (three phase bridge). However, this is more expensive but may be necessary in some applications to meet the VDE or other standards.

This behaviour has a direct influence on the design of the filter networks with its capacitors and inductors. Size and costs can be reduced.

More detailed information is available in the note D98005E „Input Rectifiers with Semi-fast Diodes“ on [www.ixys.com](http://www.ixys.com).

① Leads soldered on PCB board,  $T_{stg}$  and  $T_{vj} = -40 \dots +125^{\circ}\text{C}$

## Break-Over-Diodes Sets

We deliver also:

- Special selection of more than 2 pcs IXBOD1-... for every break down voltage of  $V_{BO} > 2000 \text{ V}$

- Example

type designation IXBOD Set SA05/00  
 $V_{BO} = 4700 \text{ V} \pm 100 \text{ V}$

(we deliver 5 pcs single selected IXBOD1-... in one plastic bag)

Customers use these products on PCB connected in series with parallel resistor  $R = 10 \text{ M}\Omega$  across each IXBOD

X202

All waveforms are into a resistive load

**Type BI** relays conduct load current in both directions.

**Type BI+** relays, in BI configuration, conduct load current in both directions.

**Type UNI** relays conduct load current from the positive terminal to the negative terminal only.

**Type BI+** relays, in UNI configuration with output MOSFETs wired in parallel, enable higher load current from positive terminal to negative terminal only.

The accompanying SSR tables reference these types (BI, BI+, & UNI) for all devices listed.

- **Replace electromechanical relays**
- **Replace mechanical switches**
- **Implement computer control of electromechanical circuits**

### Applications:

- Telecommunications/ data communications
- Instrumentation
- Multiplexers
- Data acquisition/ electronic switching
- Meters (Watt-hour, water, gas)
- Medical equipment (patient/equipment isolation)
- Security
- Industrial controls

### Features:

- Low drive current
- High reliability
- No EMI/RFI generated
- Arc-free with no contact wear
- AC or DC switching
- Current limiting
- FCC compatible
- Low off-state leakage

### Features:

- 1.5A to 30A Peak Source / Sink Drive Current
- Wide Operating Voltage Range
- -40°C to +125°C Extended Operating Temperature Range
- Logic Input Withstands Negative Swing of up to -5V
- Matched Rise and Fall Times
- Low Propagation Delay Time
- Low Output Impedance

### Applications:

- Efficient Power MOSFET and IGBT Switching
- Switch Mode Power Supplies
- Motor Controls
- DC to DC Converters
- Class-D Switching Amplifiers
- Pulse Transformer Driver

### Features:

- Separate 9A peak source and sink outputs
- Operating voltage range: -10V to +25V
- Internal negative charge pump regulator for selectable negative gate drive bias
- Desaturation detection with soft shutdown sink driver
- TTL and CMOS compatible input
- Under Voltage lockout (UVLO)
- Thermal shutdown
- Open drain fault output

### Applications:

- Driving SiC MOSFETs and IGBTs
- On-board charger and DC/DC converters
- Industrial inverters
- PFC, AC/DC and DC/DC converters

The IX4351NE is designed specifically to drive SiC MOSFETs and high power IGBTs. Separate 9A source and sink outputs allow for tailored turn-on and turn-off timing while minimizing switching losses. An internal negative charge pump regulator provides a selectable negative gate drive bias for improved  $dV/dt$  immunity and faster turn-off.

Desaturation detection circuitry detects an over current condition of the SiC MOSFET and initiates a soft turn-off to prevent a potentially damaging  $dV/dt$  event. The logic input is TTL and CMOS compatible; this input does not need to be biased with a negative gate drive bias voltage. Protection features include UVLO detection and thermal shutdown. An open-drain output signals a fault condition to the microcontroller.

The IX4351NE is rated for operational temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ , and is available in a thermally enhanced power SOIC package.

8-Pin Surface M

**Features:**

- Isolated 5.5V to 12V Photovoltaic Output
- Floating Outputs for Parallel or Series Configuration

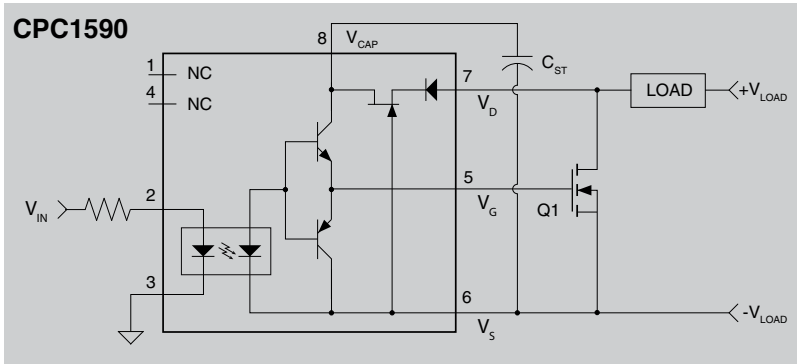

**Applications:**

- MOSFET Driver
- Isolated Floating Power Source

Part No.	Input Control Current mA	Nominal Open-Circuit Voltage $V_{OC}$ V	Nominal Short-Circuit Current $I_{SC}$ $\mu$ A	Switching Speeds $t_{on} / t_{off}$ ms	Isolation Voltage $V_{rms}$	Pack

FDA217	5	11.75	4.5	2 / 0.5	3750	8-Pin DIP, 8

## Optically Isolated Load-Biased Gate Drivers

The CPC1580 and CPC1590 are high speed, optically isolated Gate Driver ICs. On-chip circuitry charges an external capacitor voltage which eliminates the need for an external IC power supply. These Gate Drivers are ideal for low duty cycle switching devices are provided in an 8-pin flatpack package.

8-Pin Flatpack

**Applications:**

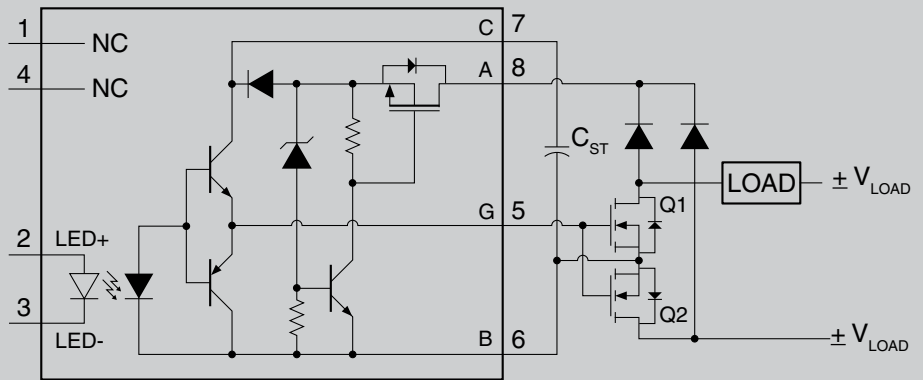

- Instrumentation
- Multiplexers
- I/O Subsystems
- Meters (Watt-Hour, Water, Gas)
- Medical Equipment (Patient / ECG)
- Security
- Industrial Controls

**Features:**

- No External IC Power Supply
- Low Drive Power Requirements (TTL/CMOS Compatible)
- Load Voltages up to 200V
- Fast Switching Speed - On: 40 $\mu$ s / Off: 400 $\mu$ s

Part No.	Input Control Current (mA)	Gate Voltage @ $I_F = 5\text{mA}$ ( $V_G$ )	Blocking Voltage ( $V_P$ )	Regulated Capacitor Voltage $V_{CAP(max)}$ (V)	Switching Speeds $t_{on} / t_{off}$ ( $\mu$ s)
CPC1580	2.5	7.5 - 12	65	$V_{DS} - 0.2$	40 / 400
CPC1590	2.5	7.5 - 12	200	16	40 / 400

## CPC1596

### Features:

- Requires No Load-side Power Supply
- Drives External Power MOSFET
- Only 2.5mA Input LED Current to Drive External MOSFET
- 3750V<sub>rms</sub> Input-to-Output Isolation

### Applications:

Optically Isolated AC or DC Relays for

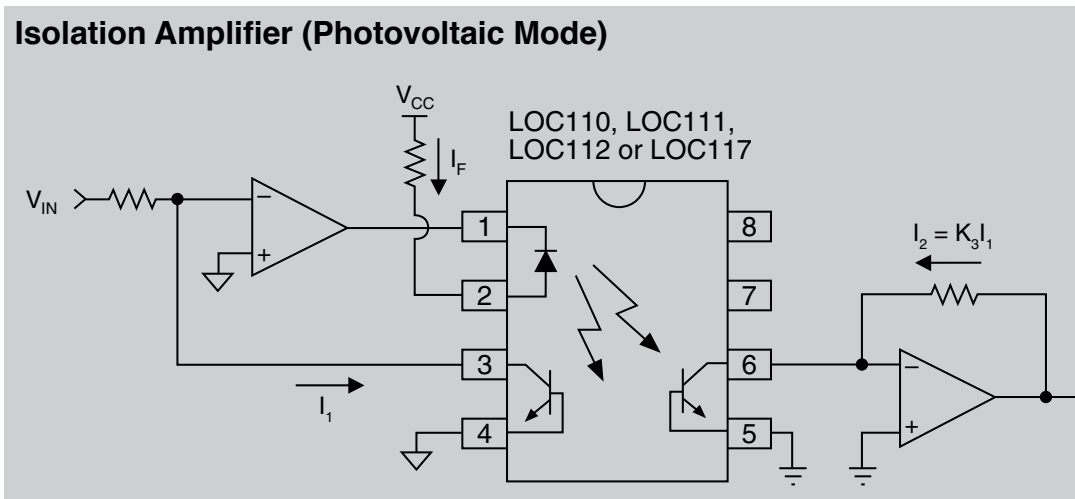

- Industrial Controls
- Instrumentation
- Medical Equipment Isolation
- Electronic Switching
- I/O Subsystems
- Appliances

- Bandwidth 40kHz
- in Photovoltaic Mode
- High Gain Stability
- Low Input / Output Capacitance
- Low Power Consumption
- 0.01% Servo Linearity
- THD 87dB Typical

SOT-23

SOT-

SOT-223

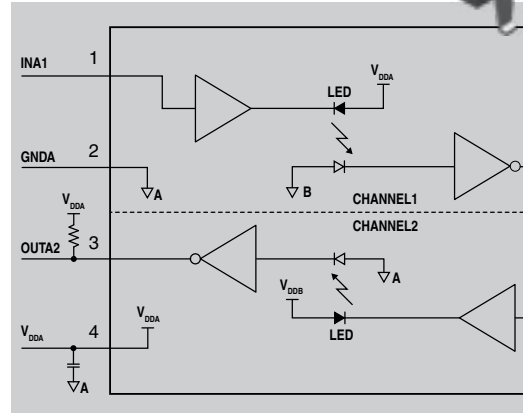

- Isolates one signal in each direction
- Operates from 2.7V to 5.5V
- Buffered inputs - no external LED drive required
- Hysteresis at inputs for noise rejection
- Slew-limited drivers reduce EMI
- 3750V<sub>rms</sub> galvanic isolation from input to output
- Power down to Hi-Z does not load outputs
- 5 Mbaud data rate

### Applications:

- Isolated signal monitoring and control
- Power-over-Ethernet, POE
- Power supply high-side interface
- Logic level translation
- Microprocessor system interface
- Inter integrated circuit (I<sup>2</sup>C) interface
- Serial peripheral interface
- Full duplex communication
- Isolated line receiver
- Isolated data acquisition systems

CPC5001

## Dual Speed Digital Optical Isolator: CPC5002

3750V<sub>rms</sub> galvanic isolation from input to output  
 Passes DC signals - no refresh clock needed

### Features:

- Dual optics isolate two signals
- **10 Mbaud** data rate
- Operates over 2.7V < V<sub>DD</sub> < 5.5V
- Power down to Hi-Z does not load outputs
- Low-power CMOS reduces supply current
- LED drive current only 1.5mA

### Applications:

- Isolated line receiver
- Ground loop elimination
- ADC/DAC digital noise isolation
- 4-wire I<sup>2</sup>C bus isolation

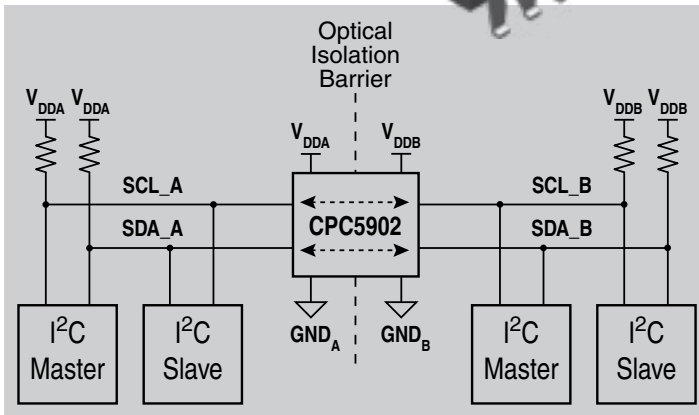

CPC5002

## Applications:

- Power-over-Ethernet (POE)
- I<sup>2</sup>C bus length extender
- Isolated control and signal monitoring
- Power supply high-side interface
- I<sup>2</sup>C logic level translation

CPC5902

## Features:

- Extends and isolates I<sup>2</sup>C interfaces
- Supports standard and fast mode
- Side B fast-mode compliant: V<sub>DDB</sub> > 4.5V
- Supports I<sup>2</sup>C clock stretching
- No internal clock - low EM & RF
- Operates on 2.7V to 5.5V
- Supports DC logic level buffering
- Glitch-free operation
- Power down to Hi-Z does not load
- Slew-limited drivers reduce EMI
- Immune to external EMI & RF en
- High voltage isolation

## Features:

- Extends and isolates I<sup>2</sup>C interfaces
- Supports standard and fast mode I<sup>2</sup>C (400kbps)
- Side B fast-mode compliant: V<sub>DDB</sub> > 4.5V
- No internal clock - low EM & RF generation
- Operates on 2.7V to 5.5V
- Supports DC logic level buffering without refresh
- Glitch-free operation
- Power down to Hi-Z does not load I<sup>2</sup>C bus
- Slew-limited drivers reduce EMI
- Immune to external EMI & RF emissions
- High voltage isolation

CPC5903

See Application Note TB-101 "Optically Isolating an I<sup>2</sup>C Interface"

- Replacement of devices in assembly type XA3370ZX12WRs
- Possible failure modes in press-pack devices
- Recommended clamps for capsule semiconductors
- Guidance for soldering leads to thyristors, GTO thyristors and IGBT's
- Device mounting instruction
- Stocking & handling requirements for press-pack and module devices
- Recommended maximum force for module gate terminals
- Press releases
- Quality documents
- IXYS UK product nomenclatures
- An IGBT in DC Breaker application

The newest additions to IXYS UK's phase control thyristor range are the 96mm diameter die capsules. These devices use low temperature sintering technology offering better thermal and electromechanical capability and are available in ratings up to 6405A and voltage ratings up to 4500V.

## Pulse Thyristors

IXYS UK Westcode Ltd are at the forefront of solid state pulsed power technology, offering custom solutions to power problems.

Standard Devices with voltage ratings to 2.5kV, pulsed currents to 150kA peak and di/dt capabilities to over 30kA/μs.

Please consult factory for other requirements for voltage ratings up to 4.5kV and pulsed current ratings >200kA.

switching behavior despite the high voltage ratings. The devices feature a positive temperature coefficient making them suitable for reliable parallel operation. Devices are available with or without integral anti-parallel diode; a range of complimentary diodes optimized for use with these IGBTs are available now with a new generation using improved technology in contact your representative for more information.

The press-pack IGBTs exhibit exceptional power cycling performance; typically an order of magnitude better than most. They are highly suited to applications such as metals and traction drive systems where there are repeated cyclic power demands. IGBTs have a stable short circuit failure mode which, as well as safety benefits, makes them an ideal choice for medium voltage applications where series connection is required. Stable short circuit failure mode allows for the design in of n+1 additional bypass switches and costly explosion proof enclosures. Typical examples include HVDC, FACTS, Active Power Filters, compensators and medium voltage drives. In applications above 4MW press-pack IGBTs offer exceptional power density that is not achievable with comparable modules in multi-level / MMC based converters.

These PPIGBT's are largely backwardly compatible with standard 2.5kV and 4.5kV GTOs in many applications such as HVDC, which makes these parts a simple and economical path to upgrade or refurbish equipment that previously used GTOs, such as medium voltage drives. They are suitable for all cooling options including direct liquid immersion. Complementary gate drivers, clamps and passive components available.

#### FEATURES

- High reliability topology
- Designed for ultra low power consumption
- Build in DC/DC-converter with soft start
- Integrated input filter for low EMI
- Separate low impedance path for parasitic EMI current
- PD-Voltage levels available up to 11 kV on request.
- Low impedance from gate to emitter at start-up and po
- Monitoring of all secondary supply voltages
- Monitoring of IGBT switching status (VCE-de-sat detect
- Soft switch-OFF at  $V_{CE-de-sat}$  fault condition
- Fiber-optic links for switching commands and status co
- Low light protection for input signal
- Short-pulse suppression. configurable
- Balanced propagation delay time
- Gate Current up to 44 A
- Optional gate-speed-up capacitors

#### APPLICATION

- Large and medium drives
- Renewable generation.
- Utilities scale converters

Using the latest 3D modelling and simulation techniques, we can significantly reduce the cycle time from concept design, minimising risk and identifying opportunity for optimisation early in the project.

With double digit growth in the preceding 5 years, in 2010 we moved into a new 300m<sup>2</sup> dedicated production facility by a well-equipped power lab. These new facilities, supported by an expanded team of engineers and technical foundations for continued investment and growth in this strategic area of our business.

## ***Standard Assemblies***

IXYS UK's standard assemblies also include the new press-pack IGBT 3-level inverters. 3 separate designs are available, a totally independent 3.3kV system, a 6.6kV system and a 10kV system. The 6.6kV and 10kV systems are based on the combination of 2 IGBT stacks and 1 diode stack. Each system benefits from direct water cooling to provide highly effective heat dissipation away from the devices and pre-loaded disc spring clamping to evenly distribute the applied force across the entire surface area of the device.

Also designed into each system is an integrated snubber circuit design and an isolated clamping rod system to limit the occurrence of eddy currents within the unit.

## ***Pulsed Power***

As a pioneer in the development of solid state pulsed power components we are able to deliver anything from discrete components to fully integrated transfer switches. With systems successfully delivering voltage ratings and pulsed currents up to 140kA, we have a wealth of experience. Our modular design solutions based on either pulse thyristor or IGBT technology and integrating control and protection functions provide a flexible 'black-box' approach to energy transfer problems.

We are involved with pulsed power on a global basis, working with research organisations such as CERN, Switzerland as well as manufacturing for emerging commercial applications such as laser systems, PEF sterilisation, magnetisation and metal forming.

as; component obsolescence, improving power equipment reliability, contract maintenance of power modules, refurbishment of power electronics, upgrades to existing systems and, of course, subcontract manufacture for new projects.

**Working systematically to the highest international standards, we can give your equipment a new lease of life and help protect your investment in these valuable assets.**

Component obsolescence is becoming a significant problem for the rail sector as equipment design life invariably exceeds that of the modern power electronics components. Our highly skilled team of engineers are able to re-engineer older equipment to incorporate the latest technology whilst maintaining compatibility.

As equipment reached half-life, many of the major power components will reach the end of their useful life resulting in a sharp decline in equipment reliability and availability. In these circumstances we can offer a full overhaul and refurbishment program for your power electronics, from engineering analysis, test and measurement through to delivery and validation of refurbished equipment.

For larger projects such as fleet wide refits, we are able to work within a consortium of specialist international sure you have the right skills on hand to deliver turnkey solutions to your requirements. This may include system management, risk assessment and safety case.

## ***Custom assemblies – our design philosophy***

**From concept through development and manufacture to after sales support, we believe strongly in working closely with our customer every step of the way – extending our philosophy of teamwork beyond our own organisation.**

We understand that good communication and close collaboration help us provide the very best service to our customers.

Using the latest 3D modelling techniques we can visualise concepts and check form, fit and function with virtual prototypes. Also, utilising advanced software packages, IXYS UK can carry out simulation modelling, allowing us to model pressure drops through coolers/manifolds and heat flows through heatsinks.

Whether finding solutions to complex engineering problems or simply manufacturing to your designs, you will find IXYS UK offers outstanding value for money, excellent quality and first class customer service.

By working closely together from the very start of a project we aim to provide the best solutions on time and in budget.

- Single-phase half or fully controlled bridges from 35 to 2200 Amps DC
- Three-phase diode bridges with current ratings from 100 to 7190 Amps DC
- Three-phase half or fully controlled bridges from 45 to 3790 Amps DC
- Hexaphase single way diode assemblies from 200 to 14380 Amps DC
- Hexaphase single way thyristor assemblies from 90 to 7580 Amps DC
- AC regulators, single and three-phase from 40 to 2940 Amps RMS

Included in our standard range are solid-state, water-cooled AC regulators for resistance welding, with ratings from 315 to 3020 Amps RMS.

Also available are water cooled, single and three-phase assemblies from 1200 to 6000 Amps RMS.

All the above ranges are suitable for 440VRMS, 50Hz mains operation.

## ***Beyond Semiconductors***

Our flexible manufacturing facility is able to readily adapt to your needs. In addition to power semiconductor assembly, we offer a wide range of elementary sub-assemblies to our customer's requirements, including capacitor banks as well as contract manufacture to your specifications.

## ***Application and engineering support***

Our highly experienced technical team is on hand to provide you with first class support for everything from the application of discrete devices to the design and development of complete power systems. We can help you from concept through design to manufacture and commissioning with you every step of the way.

### ***Components***

To complement our range of power semiconductors and assemblies IXYS UK can offer a range of supporting components including:

- Heatsinks
- Coolers
- Mounting clamps
- Ultra-rapid semiconductor protection fuses
- Capacitors
  - Snubbers
  - Rectification
  - Specialist DC link
- Gate drive units

## Single-phase bridges

## Three-phase bridges

These stacks can easily be modified to meet individual customer requirements.

Fully dimensioned drawings are available upon request from the Chippenham Factory.

## Features and Benefits

**WESPACK** devices provide the maximum power rating for weight and volume without sing on quality and reliability.

Cooling is provided by means of a low noise dual voltage (230V/115V) ac fan that protects against overloading by an integral thermal cut-out.

Surge suppression and fusing can be added to protect the devices from voltage transients and short circuits.

**Mode of Shipment:**

- in wafer form, unsawn, electrically tested, rejects are inked
- sawn wafer on foil, electrically tested, rejects are inked
- known good die in tray (Waffle Pack)
- customized die sizes / geometry on request

**For chip sales please see:**

## Direct Copper Bonded Ceramic Substrates

**DCB Ceramic Substrates (Al<sub>2</sub>O<sub>3</sub>)**

Littelfuse IXYS manufactures Direct Copper Bonded substrates on aluminum oxide (Al<sub>2</sub>O<sub>3</sub>) base.

DCB ceramic substrates form the basis for new product ideas and electronic developments with a high degree of integration.

- carriers for semiconductor chips and connection clips
- circuits similar to that on a PC board
- electrical isolator for separating „current paths“ from „heat paths“

**Standard bonded DCB** panel dimensions are:

Unclad aluminum oxide ceramic			
Al <sub>2</sub> O <sub>3</sub> content		> 96	%
dimensions		138x210, 138x190.5, 115x165*	mm
usable area	max.	130x200, 130x180, 107x156*	mm
thickness		0.63, 0.38, 0.25	mm
arc through voltage		10	kV
thermal conductivity		> 24	W/m · K
Conduction layers - both sides			
copper thickness		0.5, 0.3 (< 0.3 on request)	mm
conductor width	min.	0.5, 0.3 + / - 0.2	mm
conductor spacing	min.	0.4 + / - 0.2	mm
spacing conductor/edge of ceramic	min.	0.35 + / - 0.2	mm
surface finishes available		bare copper; nickel plated; nickel + gold plated	
peel-off resistance (90° peel test)		>6	N/mm
DCB ceramic substrate			
application temperature range		-55...+850	°C
resistant to hydrogen	max.	400	°C
thermal expansion coefficient	to typ.	7.4 x 10 <sup>-6</sup>	K <sup>-1</sup>

- DCB parts are
- bonded plate
  - bonded and p
  - prelasered, u

**X030a SMPD-B**

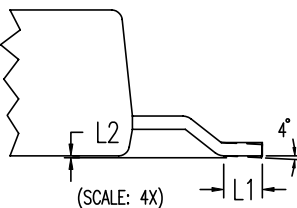

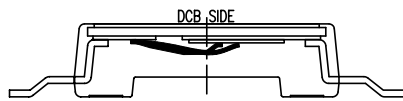

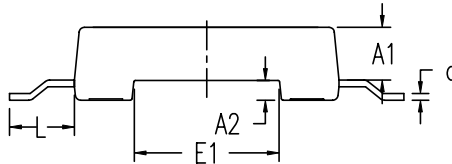

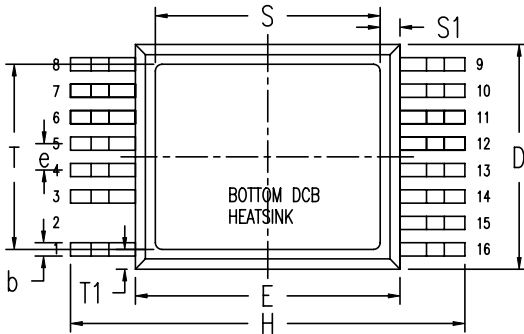

- Notes:
- 1) potusion may add 0.2 mm max. on each side
  - 2) additional max. 0.05 mm per side by punching or overlap of dam bar or bending compression
  - 3) DCB area 10 to 50 μm convex; position of DCB area in relation to plastic rim: (measured 2 mm from Cu rim)
  - 4) terminal plating: 2 - 6 μm Ni + 10 - 25 μm Sn cutting edges may be partially free of plating

- Note:
1. Bottom heatsink meets 2.6 kV AC isolation to the other pins.
  2. All leads are matte pure tin plated.

- NOTE:
1. All leads are matte pure tin plated.
  2. Cu surface of bottom DCB is exposed unless otherwise noted.
  3. Cu surface of bottom DCB is exposed to 2.500V AC from all other leads.
  4. Unless otherwise specified, pin numbers are:
    - Pin #1 - Gate
    - Pin #3 - Gate return or source
    - Pin #4 through #8 - Source
    - Pin #9 through #16 - Drain

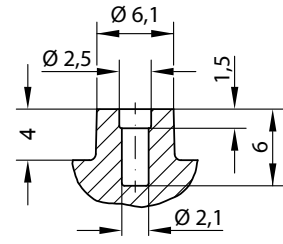

**X103 V1-A-Pack**

Detail "Y" M 5:1

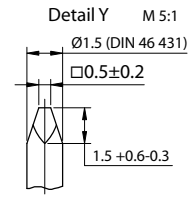

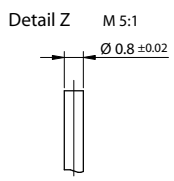

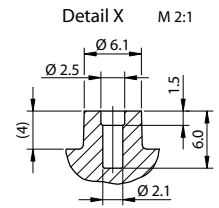

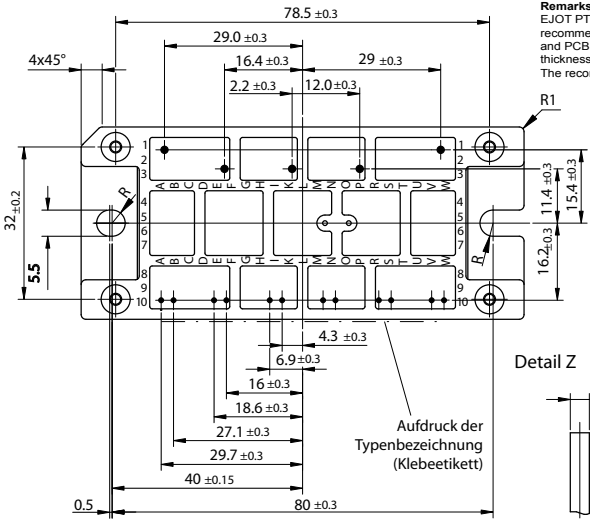

Marking on product  
Aufdruck der Typenbezeichnung

**Remarks:**  
 EJOT PT® self-tapping screws of the dimension K25 are recommended for the mechanical connection between module and PCB. Choose the right length according to your board thickness at a maximum depth of 6 mm of the module holes. The recommended mounting torque is 1.5 Nm.

**X109 Mini-Pack2B**

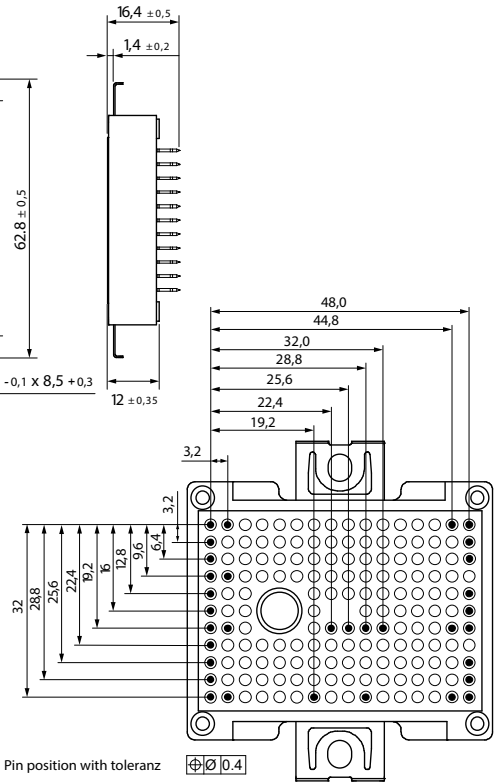

See data sheet for pin arrangement

Weight = 42 g
