6.EXPLANATION OF IMPORTANT TERMINOLOGY:

6.1 容量 Rated capacitance

产品的电容量用三位数字来表示，其中前两位数代表电容量的标称值，后一位表示电容量的指数值，即标称值后零的个数。单位为 PF

The rated capacitance value in Pico farads is expressed by a three digit number, the first two digits are significant figures and the last digit specifies the number of zero to follow.

Example: 224 indicated 220,000pF or 0.22uF

225 indicated 2,200,000pF or 2.2Uf

容量单位 CAPACITANCE UNIT:

1F=1,000mF=1,000,000uF=1,000,000,000nF=1,000,000,000,000Pf

6.2 容量误差 Capacitance tolerance

容量误差为实际容量与标称容量的偏差百分比。

The tolerance is the permissible actual capacitance relative to the rated capacitance and it is defined in percent.

Symbol of tolerance shown:

F=±1%	G=±2%	J=±5%	K=±10%	M=±20%	N=±30%

6.3 散逸因素 Dissipation factor

散逸因素是电容器在交变电压下功率损耗的衡量尺寸，它由有功损耗和无功损耗的比值确定。散逸因素随着温度、频率的不同而改变。通常以 20℃、1kHz 作为标准条件进行测量。

Dissipation factor is a measure of the power loss in a capacitor in the case of sinusoidal voltage. It's defined as the ratio between the active power P and the reactive power Q: tg δ = P/Q. As it verify with temperature and frequency it is measured at 20℃ and 1kHz as the standard of measure condition.

6.4 绝缘电阻 Insulation resistance

绝缘电阻是衡量电容器绝缘特性的指标，为电容器充电一分钟后所加的直流电压和流经电容器的漏电流值的比值，测试条件为：T=20℃ ， RH≤65％

一般情况下，小容量电容器的绝缘特性直接用绝缘电阻表示，单位为兆欧；大容量电容器的绝缘特性常用时间常数描述。

Insulation resistance is a measure of the capacitors ability to retain an electrical change for an extended period of time. It is the ratio between an applied direct voltage and the current, which flows through the capacitor. The current is measured 60s after the voltage has been applied. Ambient temperature. T=20℃ and RH≤65％. The insulation resistance is normally expressed in megohm for low capacitance capacitors and as a time constant stated in megohm-microfarads (The product of the IR measured is megohm and the capacitance measured in microfarad) for the higher capacitance value capacitor.

6.5 自愈性 Self-healing

铝箔电容器被击穿时，由于介质中碳元素温度升高会形成永久性的通路。

金属化薄膜电容器由于有自愈能力，能在被击穿时不会形成永久性的通路。当介质上存在缺陷，该处就可能发生局部电击穿。当电击穿处周围金属镀层由于电弧放电而蒸发，击穿点与周围极板隔开，电容器即可自愈。

A break-though in a plastic film/foil capacitor leads to a permanent short circuit of the capacitor due to the carbon bridge, which is built up in the break-down channel due to the high temperature rise and carbon content of the dielectric.

A metallized capacitor can withstand a break-through without a permanent short circuit on account of its self-healing ability. At a weak point in the dielectric, or because of a transient, a break-down may occur. The thin metal layer around the weak point is evaporated and the weak point is isolated. The capacitor has self-healed.
