

General Description

The SI9801DY-T1-E3 uses advanced trench technology MOSFETs to provide excellent $R_{DS(on)}$ and low gate charge. The complementary MOSFETs may be used in inverter and other applications.

A: The value of R_{GJA} is measured with the device mounted on 1in² FR-4 board with 2oz. Copper, in a still air environment with $T_A=25^\circ\text{C}$. The value in any given application depends on the user's specific board design. The current rating is based on the $t \leq 10\text{s}$ thermal resistance rating.

B: Repetitive rating, pulse width limited by junction temperature.

C. The R_{GJA} is the sum of the thermal impedance from junction to lead R_{GJL} and lead to ambient.

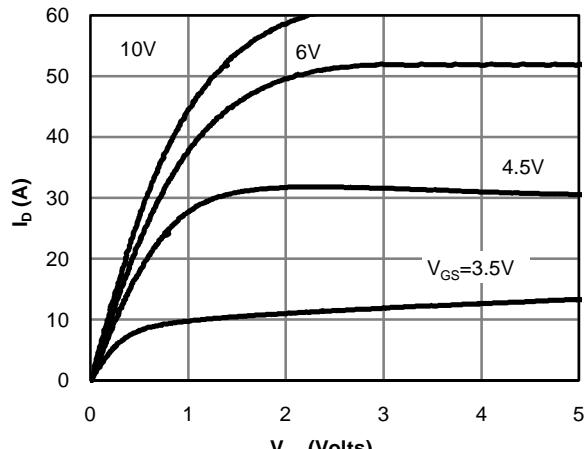

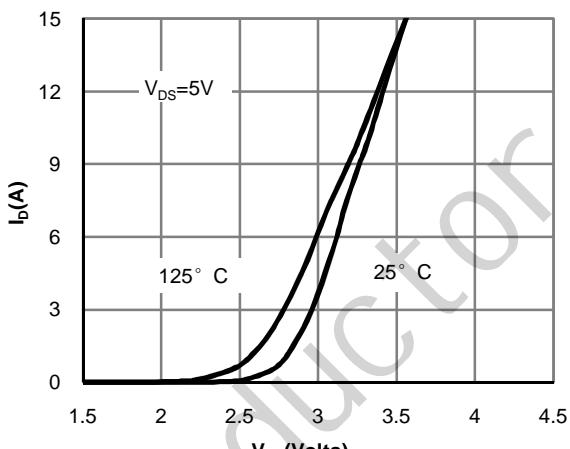

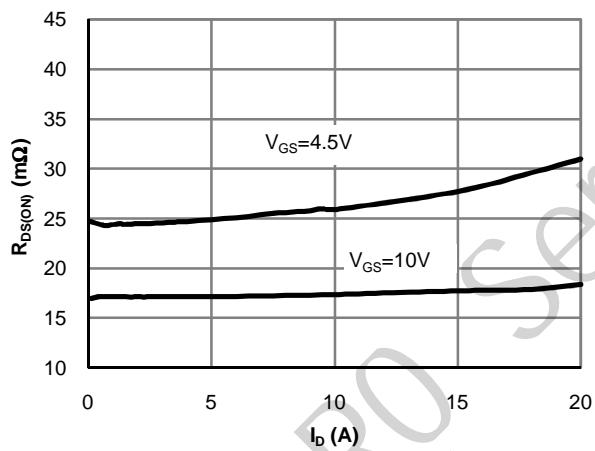

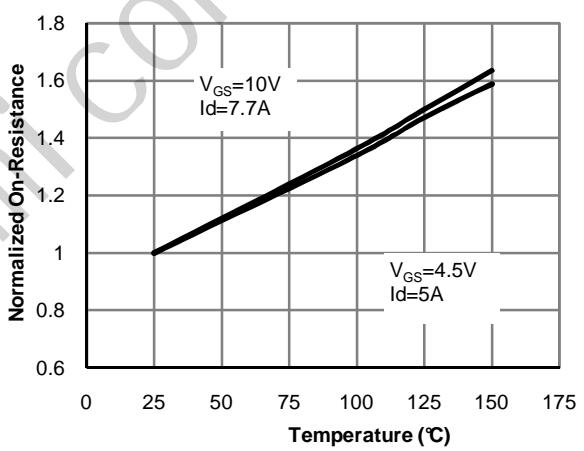

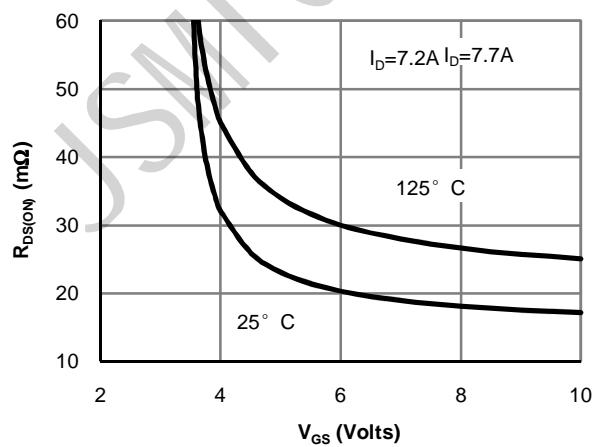

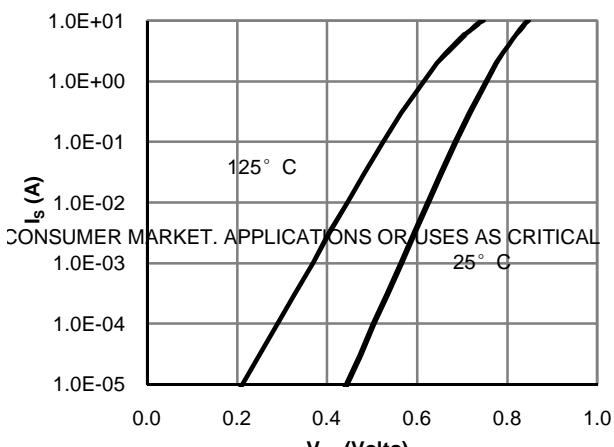

D. The static characteristics in Figures 1 to 6 are obtained using <300 μs pulses, duty cycle 0.5% max.

E. These tests are performed with the device mounted on 1 in² FR-4 board with 2oz. Copper, in a still air environment with $T_A=25^\circ\text{C}$. The SOA curve provides a single pulse rating.

F. The power dissipation and current rating are based on the $t \leq 10\text{s}$ thermal resistance rating.

H. Rg detail test condition: $V_{\text{GS}}=0\text{V}, V_{\text{DS}}=0\text{V}, V_{\text{osc}}=0.5\text{V}, f=1\text{MHz}, CS$ is 0.001nF to 1000nF(CS limit is only for checking test contact)

Setup the test condition on Rg tester, then get the Rg value.
