

## QS Family QFN Style Solder-Down Computer-on-Modules

- Solder-down version
- 27mm square
- 2.3mm total height
- QFN type lead style
  - 1mm pitch
  - 100 pads
  - Thermal pad
- Visual solder joint inspection possible after soldering
- Single-sided assembly
- High speed design compliant
- 3.3V power supply

## Key Features

- Processor
  - STM32MP1 Series
  - Arm® Cortex®-A7 650MHz
  - Arm® Cortex®-M4 209MHz
- RAM
  - 256MB or 512MB DDR3L
- ROM
  - 4GB eMMC or 128MB SLC NAND
- Grade
  - Industrial
- Temperature
  - 25°C to 85°C (eMMC)
  - 40°C to 85°C (NAND)
- Display support
  - Display Interface
    - 24-bit RGB
    - MIPI® DSI (2-lanes)\*)
  - GPU\*)
    - 3D GPU: Vivante®,
    - OpenGL® ES 2.0
- Connectivity
  - Gb Ethernet, USB2.0, eMMC/SD
  - UART, I²C, SPI, PWM, SAI, CAN\*)

## OS Support

- Linux

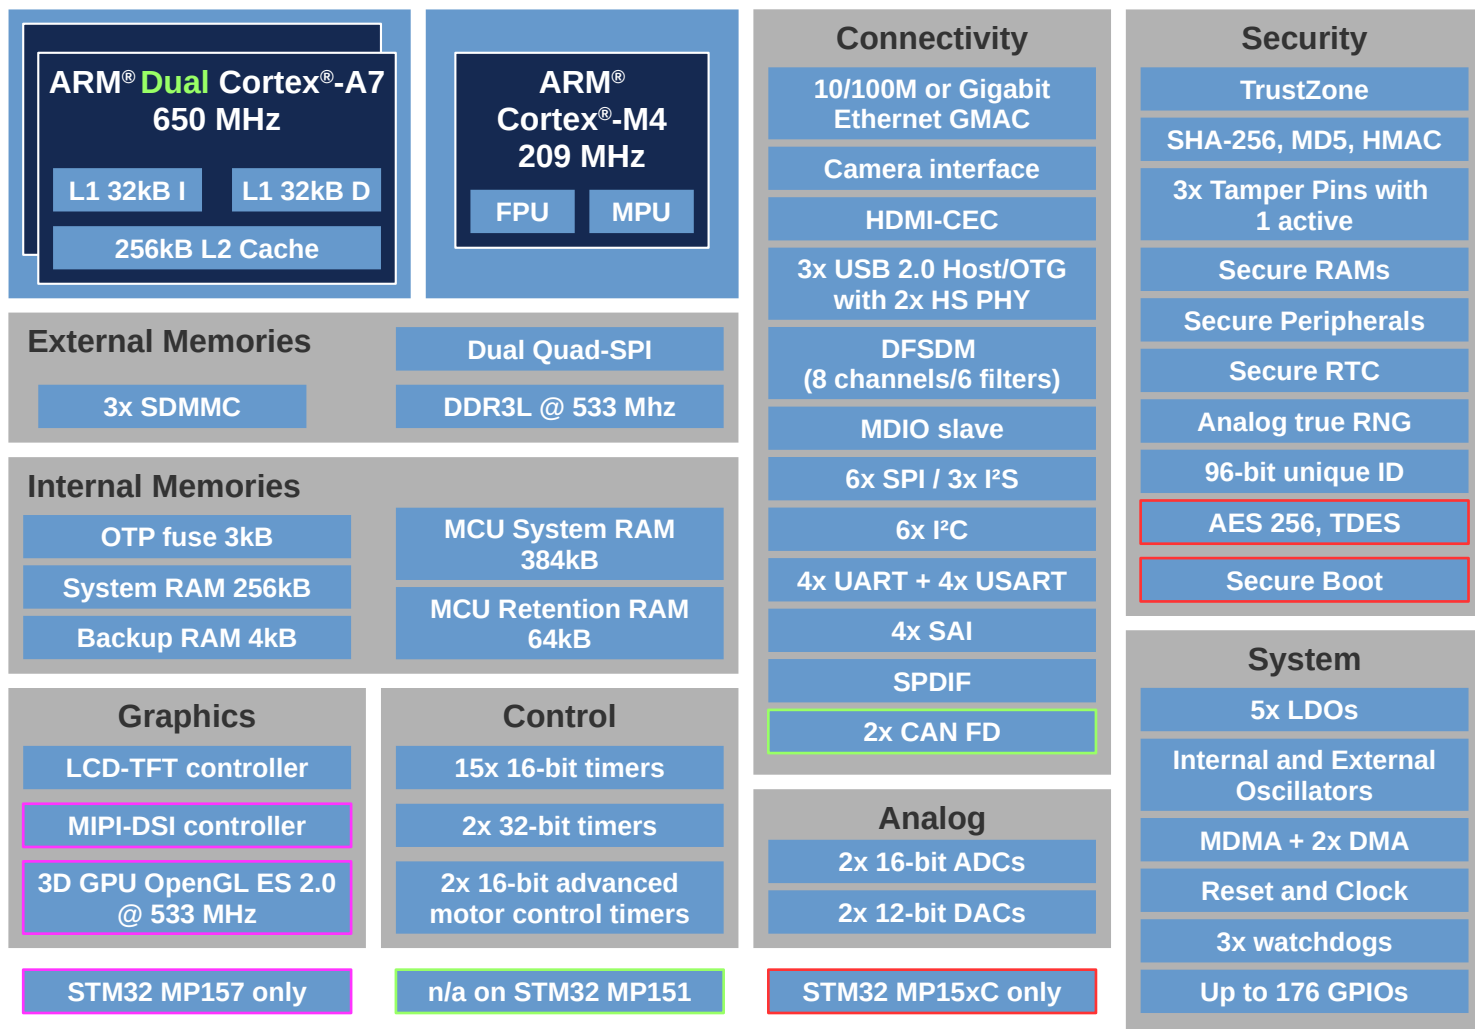

\*) Depends on SPM32MP1 version

**Dual  
Cortex®-A7**

## QFN Style Computer On Module Advantages

### Defined Return Path

The reason PCB layout becomes more and more important is because of the trend to faster, higher integrated, smaller formfactors, and lower power electronic circuits. The higher the switching frequencies are, the more radiation may occur on a PCB. With good layout, many EMI problems can be minimized to meet the required specifications.

When a module or component is used in a design, the supplier specifies the basis for such a layout. It's not only the pinout which should lead to an easy wiring without the need for crossings. He has also provide a proper solution for the signal path back to the module. If this return path, mostly the ground plane, cannot be connected near the signal pin, the return current has to take another way and this may result in a loop area. The larger the area, the more radiation and EMI problems may occur.

Ka-Ro QSCOM modules uses a large ground pad on the bottom side. With this a defined ground plane connection is available for all signals. In addition to have a good return path for all signals this large ground pad can be used for cooling.

### Easy Wiring - Even 2-layer printed circuit boards can be used.

With a solid ground plane on the bottom layer, high speed signals can be routed on the top layer at a defined impedance. However, this is only possible if a peripheral or plug can be connected directly without crossing the routing.

## Advanced Soldering

Using a large solder pad underneath the component has not only electrical and thermal advantages. This is also used to hold the component at a defined height during soldering, without the solder being compressed by the weight, which could result in short circuits.

## Standard Contact Assignments

# Layout Guidelines

## Land pattern

See figure above for the suggested module layout. The five 1mm pads in the square GND pad cutout can be omitted if no JTAG Boundary Scan test is used. The solder mask openings are shown below.

The ground pad solder mask on the bottom side of the QSCOM module is divided into sections for a better reliability of the solder joint and self-alignment of the component.

If the via holes used on the application board have a diameter larger than 0.3 mm, it is recommended to mask the via holes to prevent solder wicking through the via holes. Solders have a habit of filling holes and leaving voids in the thermal pad solder junction, as well as forming solder balls on the other side of the application board which can in some cases be problematic. The 0.7mm wide solder mask stripes can be used to arrange the vias as shown here:

## Soldering Recommendations

Ka-Ro QSCOM modules are compatible with industrial standard reflow profile for Pb-free solders. Ka-Ro will give following recommendations for soldering the module to ensure reliable solder joint and operation of the module after soldering. Since the profile used is process and layout dependent, the optimum profile should be studied case by case. Thus following recommendations should be taken as a starting point guide.

- Refer to technical documentations of particular solder paste for reflow profile configurations
- Avoid using more than one flow.
- A 150µm stencil thickness is recommended.
- Aperture size of the stencil should be 1:1 with the pad size.
- A low residue, “no clean” solder paste should be used due to low mounted height of the component.

## Recommended stencil design

Aperture size of the stencil is 1:1 with the pad size. Four 1.7mm diameter bumps are used for each of the 4.3mm square GND pads sections giving a 50% solder paste padding. The lower component settling with this ensures that the pads at the edge are always soldered even at vertical misalignment by distortion or warping.

## Thermal Considerations

The QSCOM module consume more than 1 W of DC power. In any application where high ambient temperatures for more than a few seconds can occur, it is important that a sufficient cooling surface is provided to dissipate the heat. The thermal pad at the bottom of the module must be connected to the application board ground planes by soldering. The application board should provide a number of vias under and around the pad to conduct the produced heat to the board ground planes, and preferably to a copper surface on the other side of the board in order to conduct and spread the heat. The module internal thermal resistance should in most cases be negligible compared to the thermal resistance from the module into air, and common equations for surface area required for cooling can be used to estimate the temperature rise of the module. Only copper planes on the circuit board surfaces with a solid thermal connection to the module ground pad will dissipate heat. For an application with high load the maximum allowed ambient temperature should be reduced due to inherent heating of the module, especially with small fully plastic enclosed applications where heat transfer to ambient air is low due to low thermal conductivity of plastic. The module measured on the evaluation board exhibits a temperature rise of about 20°C above ambient temperature. An insufficiently cooled module will rapidly heat beyond operating range in ambient room temperature.

# Packaging

- (I) Measured from centreline of sprocket hole to centreline of pocket.
- (II) Cumulative tolerance of 10 sprocket holes is  $\pm 0.20$ .

## Electrical characteristics

### Absolute maximum ratings

Parameter	Symbol	Min	Max	Remarks
Power supply	V <sub>IN</sub>	0V	3.9V	
Input voltage on USB VBUS pins	USBA_VBUS USB_B_VBUS	0V	6V	
Input voltage on USB DN/DP pins	USBA_DN/DP USB_B_DN/DP	0V	5.5V	
Input voltage on any other pins		0V	3.9V	
Storage temperature range	T <sub>STORAGE</sub>	-40°C	150°C	

### Operating ranges

Parameter	Symbol	Min	Max	Remarks
Power supply	V <sub>IN</sub>	3.1V	3.6V	
I/O input low level voltage	V <sub>IL</sub>	-	0.3 x V <sub>IN</sub>	
I/O input high level voltage	V <sub>IH</sub>	0.7 x V <sub>IN</sub>	-	
I/O output voltage	Refer to STM32MP1 datasheet, chap. Output voltage levels.			VDD=V <sub>IN</sub> =3.3V typ.
Operating temperature range	T <sub>AMB</sub>	-25°C -40°C	85°C	QSMP /E85 QSMP /I
Processor junction temperature	T <sub>J</sub>	-40°C	125°C	

### Power supply currents

Parameter	Symbol	V <sub>IN</sub>	Current	Remarks
At U-Boot prompt	I <sub>UBOOT</sub>	3.3V	195mA	All pins left unconnected
At Linux prompt	I <sub>LINUX</sub>	3.3V	TBD	
Sleep	I <sub>SLEEP</sub>	3.3V	TBD	
Maximum calculated	I <sub>MAX</sub>	3.3V	700mA	Calculated on max. IDD's @ 80% onboard power supply efficiency.
Power supply rating	I <sub>SUPP</sub>	3.3V	1A	With margin for sizing the power supply

### Alternate UART pin mappings
