

## General Description

The KY32xx series devices are EIA/TIA-232 and V.28/V.24 communication interfaces achieve 1µA supply current with KEYSEMI's revolutionary POWERSAVE™ feature. A proprietary, high- efficiency, dual charge-pump regulated voltage converters and a low-dropout transmitter combine to deliver true RS-232 performance from a single +3.0V to +5.5V supply.

These devices can operate from input voltages ranging from +3.0V to +5.5V at the guaranteed data rate of 250k bits/sec with enhanced electrostatic discharge (ESD) protection in all RS232 I/O pins exceeding ±15kV EN61000-4-2 Air Gap Discharge and ±8kV EN61000-4-2 Contact Discharge.

The POWERSAVE proprietary function which automatically powers down the on-chip regulated voltage converters and driver circuits when a RS-232 cable is disconnected from the host interface or when a connected peripheral device is turned off. The system turns on again when a valid level is applied to any RS-232 receiver input.

## Features

- Meets EIA/TIA-232F and CCITT V.28/V.24 specifications for  $V_{CC}$  at +3.3V ±10% and +5V ±10%
- Low POWERSAVE Current: 1µA typical, 10µA max
- Guaranteed Data Rate 250kbps
- Extended ESD Protection for RS-232 I/O Pins ±15kV HBM
- High Data Rate at 1000kbps Available on KY32xxF Series

## Applications

- Battery-Powered And Hand-Held Applications
- Peripherals interface
- Portable Diagnostics Equipment
- Terminal Adapters and POS terminals
- Notebooks, Subnotebooks, and Palmtops
- Industrial and Embedded PCs

## Detailed Description

### Charge-Pump

The KY32xx's family utilizes regulated on-chip dual charge pumps that provides output voltages of +5.5V(doubling charge pump) and -5.5V (inverting charge pump), regardless of the input voltage (V<sub>CC</sub>) over the +3.0V to +5.5V range. The charge pumps operate in a discontinuous mode: if the output voltages are less than 5.5V, the charge pumps are enabled; if the output voltages exceed 5.5V, the charge pumps are disabled. Each charge pump requires a flying capacitor (C1, C2) and a reservoir capacitor (C3, C4) to generate the V+ and V- supplies.

### RS-232 Transmitters

The transmitters are proprietary, low dropout, inverting level translators that convert TTL/CMOS inputs to EIA/TIA-232 output levels. Coupled with the on-chip 5.5V supplies, these transmitters deliver true RS-232 levels over a wide range of single supply system voltages. When  $\overline{\text{SD}}$  is driven to ground, or the POWERSAVE circuitry senses invalid voltage levels at all receiver inputs, the transmitters are disabled and the outputs are forced into a high- impedance state.

### RS-232 Receive

The KY32xx's receivers convert RS-232 signals to CMOS-logic output levels. They are contain standard inverting receivers that three-state (except for the KY3232, KY3243) via the  $\overline{\text{EN}}$  or  $\overline{\text{SD}}$  control lines.

### Controlled Power-Down

The KY3220, KY3221, KY3222, KY3223 and KY3243 have a low-power shutdown mode controlled by the  $\overline{\text{SD}}$  pin. During shutdown the driver output and the switch-capacitor regulated voltage converter are disabled with the supply current falls to less than 1μA. The KY3221, KY3223 and KY3243 use KEYSEMI's patent pending POWERSAVE circuitry to set/reset latches, which enable the circuit shutdown function when a RS232 cable is disconnected or when the peripheral is turned off and reduce the power supply drain to 1μA supply current. When a RS232 cable is connected or when the peripheral is enabled, the devices will automatically become active again.

### ESD Immunity

The KY32xx series incorporates ruggedized ESD cells on all driver output and receiver input pins.

The ESD structure is improved for more rugged applications and environments sensitive to electro-static discharges and associated transients.

The improved ESD tolerance is at least +15kV without damage nor latch-up.

There are two methods within EN61000-4-2, the Air Discharge method and the Contact Discharge method.

With the Air Discharge Method, an ESD voltage is applied to the equipment under test through air, which simulates an electrically charged person ready to connect a cable onto the rear of the system and the high energy potential on the person discharges through an arcing path to the rear panel of the system before he or she even touches the system.

The Contact Discharge Method applies the ESD current directly to the EUT.

This method was devised to reduce the unpredictability of the ESD arc.

The discharge current rise time is constant since the energy is directly transferred without the air-gap arc inconsistencies.

KEYSEMI's RS232 transceivers meets and exceeds the minimum criteria for EN61000-4-2 with  $\pm 15\text{kV}$  for Air Gap Discharge and  $\pm 8\text{kV}$  for Contact Discharge.

The circuit models in following Figures represent the typical ESD testing circuit.

The CS is initially charged with the DC power supply when the first switch (SW1) is on.

Now that the capacitor is charged, the second switch (SW2) is on while SW1 switches off.

The voltage stored in the capacitor is then applied through RS, the current limiting resistor, onto the device under test (DUT).

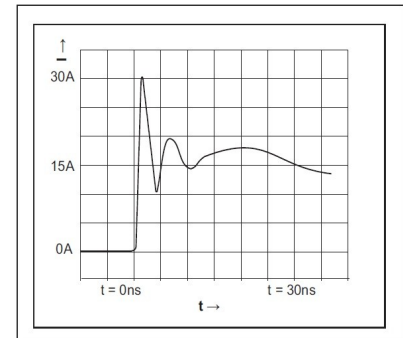

In ESD tests, the SW2 switch is pulsed so that the device under test receives a duration of voltage.

For the Human Body Model, the current limiting resistor (RS) and the source capacitor (CS) are  $1.5\text{k}\Omega$  and  $100\text{pF}$ , respectively. For IEC-61000-4-2, the current limiting resistor (RS) and the source capacitor (CS) are  $330\Omega$  and  $150\text{pF}$ , respectively.

The higher CS value and lower RS value in the IEC61000-4-2 model are more stringent than the Human Body Model.

The larger storage capacitor injects a higher voltage to the test point when SW2 is switched on.

The lower current limiting resistor increases the current charge onto the test point.

4. DIMENSION "b" DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.003[0.08mm] TOTAL IN EXCESS OF THE "b" DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT. MINIMUM SPACE BETWEEN PROTRUSION AND AN ADJACENT LEAD TO BE 0.0028[0.07mm]
5. TOLERANCE : ±0.010[0.25mm] UNLESS OTHERWISE SPECIFIED.
6. OTHERWISE DIMENSION FOLLOW ACCEPTABLE SPEC.
7. REFERENCE DOCUMENT : JEDEC SPEC MO-153
