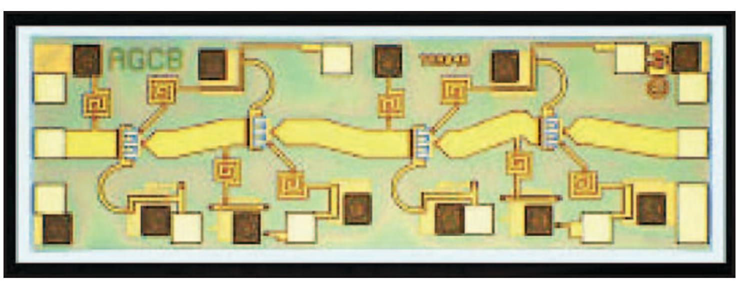
Keysight Technologies
HMMC–5023 23 GHz LNA (21.2–26.5 GHz)

Data Sheet



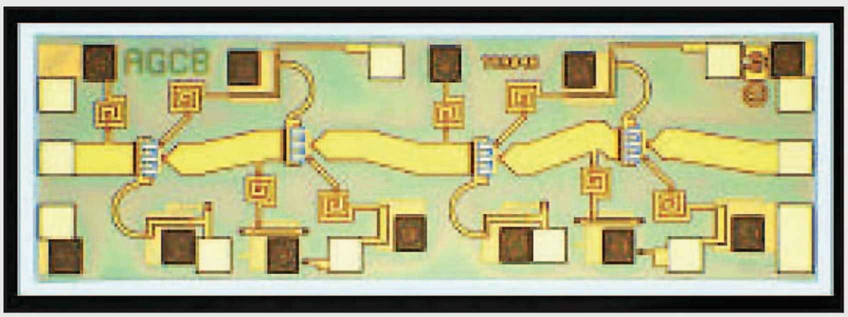
Features

- Frequency range:
  21.2-23.6 GHz and
  24.5-26.5 GHz specified
  21-30 GHz performance
- Low-noise temperature:
  226 k (2.5 dB N.F.) typical
- High gain: 24 dB typical
- 50 Ω input/output matching
- Single supply bias with optional bias adjust:
  5 volts (@ 24 mA typical)

KEYSIGHT TECHNOLOGIES

Description

The HMMC-5023 MMIC is a highgain low-noise amplifi er (LNA) that operates from 21 GHz to over 30 GHz. By eliminating the complex tuning and assembly processes typically required by hybrid (discrete–FET) amplifiers, the HMMC-5023 is a costeffective alternative in both 21.2-23.6 GHz and 24.5-26.5 GHz communications receivers. The device has good input and output match to 50 ohms and is unconditionally stable to more than 40 GHz. The backside of the chip is both RF and DC ground. This helps simplify the assembly process and reduces assembly related performance variations and costs. It is fabricated using PHEMT integrated circuit structure that provides exceptional noise and gain performance.



Chip Size:
1880 × 600 µm (74 × 23.6 mils)
Chip Size Tolerance:
±10 µm (±0.4 mils)
Chip Thickness:
127 ± 15 µm (5 ±0.6 mils)
Pad Dimensions:
80 × 80 µm (3.1 × 3.1 mils), or larger

Absolute Maximum Ratings[1]

Symbol	Parameters/conditions	Min	Max	Units
V_{D1}, V_{D2}	Drain Supply Voltage	3	8	volts
V_{G1}, V_{G2}	Gate Supply Voltage	0.4	2	volts
I_{D1}	Drain Supply Current		35	mA
I_{D2}	Drain Supply Current		35	mA
P_{in}	RF Input Power[2]		15	dBm
T_{ch}	Channel Temperature[3]		150	°C
T_A	Backside Ambient Temperature	–55	+140	°C
T_{st}	Storage Temperature	–65	+165	°C
T_{max}	Max. Assembly Temperature		300	°C

1. Absolute maximum ratings for continuous operation unless otherwise noted.
2. Operating at this power level for extended (continuous) periods is not recommended.
3. Refer to DC Specifi cations/Physical Properties table for derating information.

DC Specifications/Physical Properties[1]

Symbol	Parameters/conditions	Min.	Typ.	Max	Units
V_{D1}, V_{D2}	Recommended Drain Supply Voltage	3	5	7	Volts
V_{G1}, V_{G2}	Gate Supply Voltage ($V_{D1} \le V_{D1\,(max)}$, $V_{D2} \le V_{D2\,(max)}$)	0.4	0.8[2]	2	Volts
I_{D1}, I_{D2}	Input and Output Stage Drain Supply Current ($V_{G1} = V_{G2}$ = Open, $V_{D1} = V_{D2}$ = 5 Volts)		12	35	mA
$I_{D1} + I_{D2}$	Total Drain Supply Current ($V_{G1} = V_{G2}$ = Open, $V_{D1} = V_{D2}$ = 5 Volts)	13	24	30	mA
θ_{ch-bs}	Thermal Resistance[3] (Channel-to-Backside at T_{ch} = 150 °C)		75		°C/Watt
T_{ch}	Channel Temperature[4] (T_A = 140 °C, MTTF = 106 hrs, $V_{G1} = V_{G2}$ = Open, $V_{D1} = V_{D2}$ = 5 Volts)		150		°C

1. Backside ambient operating temperature T_A = 25 °C unless otherwise noted.
2. Open circuit voltage at V_{G1} and V_{G2} when V_{D1} and V_{D2} are 5 volts.
3. Thermal resistance (in °C/Watt) at a channel temperature T(°C) can be estimated using the equation:
4. $\theta(T) = 75 \times [T(°C) + 273] / [150°C + 273]$.
5. Derate MTTF by a factor of two for every 8 °C above T_{ch}.

RF Specifications

(Top = 25°C, $V_{D1} = V_{D2}$ = 5 V, $V_{G1} = V_{G2}$ = Open, ZO = 50 Ω, unless otherwise noted)

Symbol	Parameters/conditions		21.2 to 23.6 GHz			24.5 to 26.5 GHz			
			Typ	Min	Max	Typ.	Min	Max	Units

		25 GHz					2.8	3.3	dB

Applications

The HMMC-5023 low noise amplifier (LNA) is designed for use in digital radio communication systems that operate within the 21.2 to 23.6 GHz and 24.5 to 26.5 GHz frequency bands. High gain and low noise temperture make it ideally suited as a front-end gain stage. The MMIC solution is a cost effective alternative to hybrid assemblies.

Biasing and Operation

The HMMC-5023 has four cascaded gain stages as shown Figure 1. The first two gain stages at the input are biased with the VD1 drain supply. Similarly the two output stages are biased with the VD2 supply. Standard LNA operation is with a single positive DC drain supply voltage (VD1 = VD2 = 5 V) using the assembly diagram shown in Figure 8(a).

If desired, the output stage DC supply voltage (VD2) can be increased to improve output power capability while maintaining optimum low noise bias conditions for the input section. The output power may also be adjusted by applying a positive voltage at VG2 to alter the operating bias point for both output FETs. Increasing the voltage applied to VG2 (more positively) results in a more negative gate-to-source voltage and, therefore, lower drain current. Figures 8(b) and 8(c) illustrate how the device can be assembled for both independent drain supply operation and for output-stage gate bias control.

No ground wires are required since ground connections are made with plated through-holes to the backside of the device.

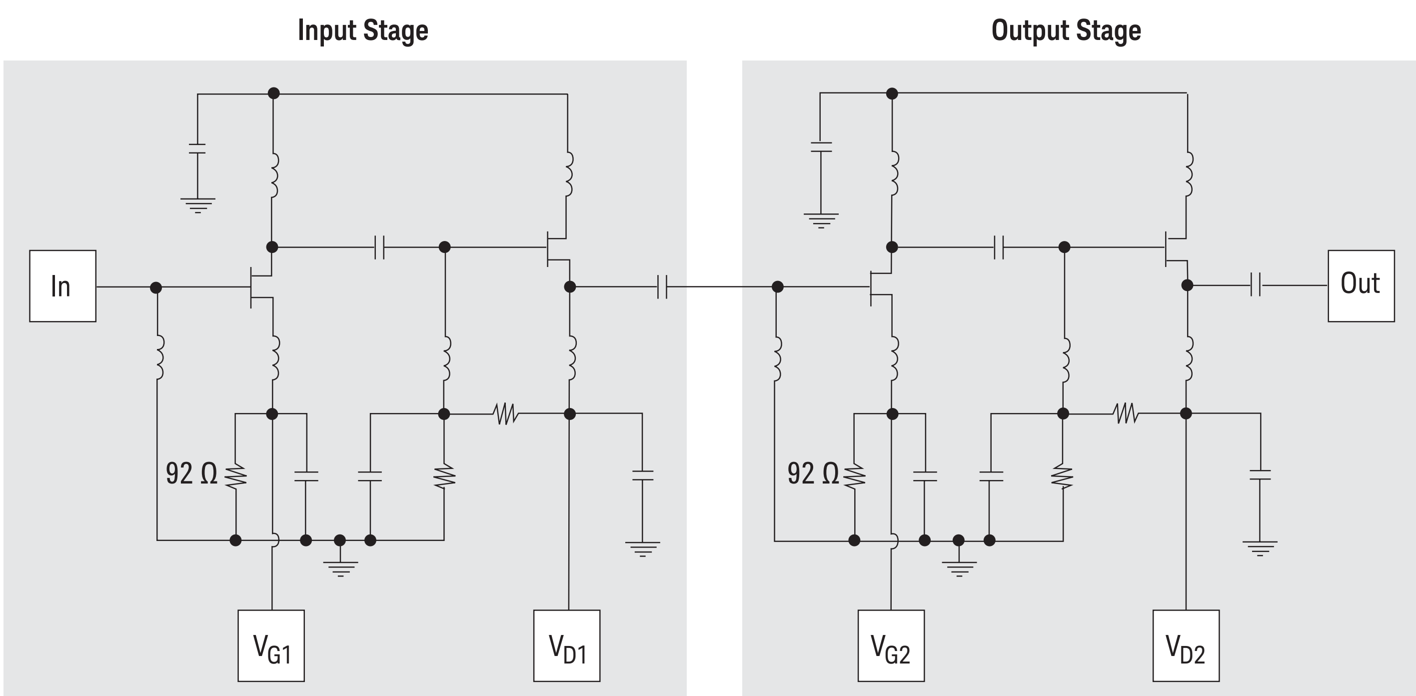

Figure 1. Simplified schematic diagram

Assembly Techniques

It is recommended that the RF input and RF output connections be made using either 500 line/inch (or equivalent) gold wire mesh, or dual 0.7 mil diameter gold wire. The RF wires should be kept as short as possible to minimize inductance. The bias supply wire can be a 0.7 mil diameter gold wire attached to either of the VDD bonding pads.

GaAs MMICs are ESD sensitive. ESD preventive measures must be employed in all aspects of storage, handling, and assembly. MMIC ESD precautions, handling considerations, die attach and bonding methods are critical factors in successful GaAs MMIC performance and reliability. Keysight Technologies, Inc. application note (5991-3484EN), “GaAs MMIC ESD, Die Attach and Bonding Guidelines” provides basic information on these subjects.

Notes

This data sheet contains a variety of typical and guaranteed performance data. The information supplied should not be interpreted as a complete list of circuit specifications. Customers considering the use of this, or other TCA GaAs ICs, for their design should obtain the current production specifications from Keysight. In this data sheet the term typical refers to the 50th percentile performance. For additional information and support email: mmic_helpline@keysight.com.
