

## ± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications

PART NUMBER:

KX222-1054

Rev. 1.0

26-Sep-16

### Product Description

The KX222-1054 is a tri-axis  $\pm 8g$ ,  $\pm 16g$  or  $\pm 32g$  silicon micromachined accelerometer with integrated 2048 byte buffer, orientation, tap/double tap, activity detecting, and Free fall algorithms. The sense element is fabricated using Kionix's proprietary plasma micromachining process technology. Acceleration sensing is based on the principle of a differential capacitance arising from acceleration-induced motion of the sense element, which further utilizes common mode cancellation to decrease errors from process variation, temperature, and environmental stress. The sense element is hermetically sealed at the wafer level by bonding a second silicon lid wafer to the device using a glass frit. A separate ASIC device packaged with the sense element provides signal conditioning, and intelligent user-programmable application algorithms. The accelerometer is delivered in a 2 x 2 x 0.9 mm LGA plastic package operating from a 1.71 – 3.6V DC supply. Voltage regulators are used to maintain constant internal operating voltages over the range of input supply voltages. This results in stable operating characteristics over the range of input supply voltages. I<sup>2</sup>C or SPI digital protocol is used to communicate with the chip to configure and check for updates to the orientation, Directional Tap™ detection, Free fall detection and activity monitoring algorithms.

### Features

- 2 x 2 x 0.9 mm LGA
- User-selectable g Range up to  $\pm 32g$
- User-selectable Output Data Rate up to 25600Hz
- User-selectable low power or high resolution mode
- Digital High-Pass Filter Outputs
- Extra large embedded 2048 byte FIFO/FILO buffer
- Low Power Consumption with FlexSet™ Performance Optimization
- Internal voltage regulator
- Enhanced integrated Free fall, Directional Tap/Double-Tap™, and Device-orientation Algorithms
- User-configurable wake-up function
- Digital I<sup>2</sup>C up to 3.4MHz
- Digital SPI up to 10MHz
- Lead-free Solderability
- Excellent Temperature Performance
- High Shock Survivability
- Factory Programmed Offset and Sensitivity
- Self-test Function

## Product Specifications

### Mechanical

(specifications are for operation at VDD = 2.5V and T = 25°C unless stated otherwise)

Parameters		Units	Min	Typical	Max
Operating Temperature Range		°C	-40	-	85
Zero-g Offset		mg		±75	
Zero-g Offset Variation from RT over Temp.		mg/°C		0.5	
Sensitivity <sup>1</sup>	GSEL1=0, GSEL0=0 (±8g)	counts/g		4096	
	GSEL1=0, GSEL0=1 (± 16g)			2048	
	GSEL1=1, GSEL0=0 (± 32g)			1024	
Sensitivity (Buffer 8-bit mode) <sup>1,2</sup>	GSEL1=0, GSEL0=0 (± 8g)	counts/g		16	
	GSEL1=0, GSEL0=1 (± 16g)			8	
	GSEL1=1, GSEL0=0 (± 32g)			4	
Sensitivity Variation from RT over Temp.		%/°C		0.01	
Positive Self Test Output change on Activation <sup>5</sup>		g		0.5	
Mechanical Resonance (-3dB) <sup>3</sup>		Hz		XY 6000 Z 3600	
Non-Linearity		% of FS		0.6	
Cross Axis Sensitivity		%		2	
Noise (with low-pass filter = ODR/9) <sup>4</sup>		$\mu\text{g} / \sqrt{\text{Hz}}$		XY 750 Z 1200	

**Table 1: Mechanical Specifications**

#### Notes:

1. Resolution and acceleration ranges are user selectable via I<sup>2</sup>C or SPI.
2. Sensitivity is proportional to BRES in BUF\_CNTL2.
3. Resonance as defined by the dampened mechanical sensor.
4. Noise varies with Output Data Rate (ODR) and Current Consumption settings. Please consult [FlexSet™ Performance Optimization Tool](#) for additional details.
5. Requires changing of STPOL bit in INC1 register to 1 prior to performing self-test

## Electrical

(specifications are for operation at VDD = 2.5V and T = 25°C unless stated otherwise)

Parameters		Units	Min	Typical	Max
Supply Voltage (VDD)	Operating	V	1.71	2.5	3.6
I/O Pads Supply Voltage (IO_VDD)		V	1.7		VDD
Current Consumption	High Resolution Mode (RES = 1)	µA		145	
	Low Power Mode <sup>1</sup> (RES = 0)			10	
	Standby			0.9	
Output Low Voltage (IO_VDD < 2V) <sup>2</sup>		V	-	-	0.2 * IO_VDD
Output Low Voltage (IO_VDD ≥ 2V) <sup>2</sup>		V	-	-	0.4
Output High Voltage		V	0.8 * IO_VDD	-	-
Input Low Voltage		V	-	-	0.2 * IO_VDD
Input High Voltage		V	0.8 * IO_VDD	-	-
Input Pull-down Current		µA		0	
Start Up Time <sup>3</sup>		ms	2.0		1300
Power Up Time <sup>4</sup>		ms		20	50
I <sup>2</sup> C Communication Rate		MHz			3.4
SPI Communication Rate		MHz			10
Output Data Rate (ODR) <sup>5</sup>		Hz	0.781	50	25600
Bandwidth (-3dB) <sup>6</sup>	RES = 0	Hz		800	
	RES = 1	Hz		ODR/2	

**Table 2:** Electrical Specifications

**Notes:**

1. Current varies with Output Data Rate (ODR) as shown the chart below, and the Average Filter Control settings and can be tested using Kionix FlexSet™ Performance Optimization Tool found at <http://www.kionix.com/flexset>.
2. For I<sup>2</sup>C communication, this assumes a minimum 1.5kΩ pull-up resistor on SCL and SDA pins.
3. Start up time is from PC1 set to valid outputs. Time varies with Output Data Rate (ODR); see chart below
4. Power up time is from VDD valid to device boot completion.
5. User selectable through I<sup>2</sup>C or SPI.
6. User selectable and dependent on ODR and RES.

**Power-On Procedure**

Proper functioning of power-on reset (POR) is dependent on the specific **VDD**, **VDD<sub>Low</sub>**, **T<sub>VDD</sub>** (rise time), and **T<sub>VDD\_OFF</sub>** profile of individual applications. It is recommended to minimize **VDD<sub>Low</sub>**, and **T<sub>VDD</sub>**, and maximize **T<sub>VDD\_OFF</sub>**. It is also advised that the **VDD** ramp up time **T<sub>VDD</sub>** be monotonic. Note that the outputs will not be stable until **VDD** has reached its final value.

- ! *To assure proper POR, the application should be evaluated over the customer specified range of VDD, VDD<sub>Low</sub>, T<sub>VDD</sub>, T<sub>VDD\_OFF</sub> and temperature as POR performance can vary depending on these parameters.*

Please refer to Technical Note [TN004 KX1xx, KX2xx Accelerometer Power-On Procedure](#) for more information.

Operating Temperature Range		°C	-40	-	85
Storage Temperature Range		°C	-55	-	150
Mech. Shock (powered and unpowered)		g	-	-	5000 for 0.5ms 10000 for 0.2ms
ESD	HBM	V	-	-	2000

**Table 3:** Environmental Specifications

Caution: ESD Sensitive and Mechanical Shock Sensitive Component, improper handling can cause permanent damage to the device.

These products conform to RoHS Directive 2011/65/EU of the European Parliament and of the Council of the European Union that was issued June 8, 2011. Specifically, these products do not contain any non-exempted amounts of lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB) or polybrominated diphenyl ethers (PBDE) above the maximum concentration values (MCV) by weight in any of its homogenous materials.

Homogenous materials are “of uniform composition throughout”. The MCV for lead, mercury, hexavalent chromium, PBB, and PBDE is 0.10%. The MCV for cadmium is 0.010%.

Applicable Exemption: 7C-I - *Electrical and electronic components containing lead in a glass or ceramic other than dielectric ceramic in capacitors (piezoelectronic devices) or in a glass or ceramic matrix compound.*

These products are also in conformance with REACH Regulation No 1907/2006 of the European Parliament and of the Council that was issued Dec. 30, 2011. They do not contain any Substances of Very High Concern (SVHC-161) as identified by the European Chemicals Agency as of 17 December 2014.

This product is halogen-free per IEC 61249-2-21. Specifically, the materials used in this product contain a maximum total halogen content of 1500 ppm with less than 900-ppm bromine and less than 900-ppm chlorine.

**Soldering**

Soldering recommendations are available upon request or from [www.kionix.com](http://www.kionix.com).

	<b>± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KX222-1054</b> <b>Rev. 1.0</b> <b>26-Sep-16</b>

## Terminology

### g

A unit of acceleration equal to the acceleration of gravity at the earth's surface.

$$1g = 9.8 \frac{m}{s^2}$$

One thousandth of a g (0.0098 m/ s<sup>2</sup>) is referred to as 1 milli-g (1 mg).

### Sensitivity

The sensitivity of an accelerometer is the change in output per unit of input acceleration at nominal VDD and temperature. The term is essentially the gain of the sensor expressed in counts per g (counts/g) or LSB's per g (LSB/g). Occasionally, sensitivity is expressed as a resolution, i.e. milli-g per LSB (mg/LSB) or milli-g per count (mg/count). Sensitivity for a given axis is determined by measurements of the formula:

$$Sensitivity = \frac{(Output @ +1g - Output @ -1g)}{2g}$$

The sensitivity tolerance describes the range of sensitivities that can be expected from a large population of sensors at room temperature and over life. When the temperature deviates from room temperature (25°C), the sensitivity will vary by the amount shown in Table 1.

### Zero-g offset

Zero-g offset or 0-g offset describes the actual output of the accelerometer when no acceleration is applied. Ideally, the output would always be in the middle of the dynamic range of the sensor (content of the OUTX, OUTY, OUTZ registers = 00h, expressed as a 2's complement number). However, because of mismatches in the sensor, calibration errors, and mechanical stress, the output can deviate from 00h. This deviation from the ideal value is called 0-g offset. The zero-g offset tolerance describes the range of 0-g offsets of a population of sensors over the operating temperature range.

### Self-test

Self-test allows a functional test of the sensor without applying a physical acceleration to it. When activated, an electrostatic force is applied to the sensor, simulating an input acceleration. The sensor outputs respond accordingly. If the output signals change within the amplitude specified in Table 1, then the sensor is working properly and the parameters of the interface chip are within the defined specifications.

	<b>± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KX222-1054</b> <b>Rev. 1.0</b> <b>26-Sep-16</b>
---	---	---

## Functionality

### Sense element

The sense element is fabricated using Kionix's proprietary plasma micromachining process technology. This process technology allows Kionix to create mechanical silicon structures which are essentially mass-spring systems that move in the direction of the applied acceleration. Acceleration sensing is based on the principle of a differential capacitance arising from the acceleration-induced motion. Capacitive plates on the moving mass move relative to fixed capacitive plates anchored to the substrate. The sense element is hermetically sealed at the wafer level by bonding a second silicon lid wafer to the device using a glass frit.

### ASIC interface

A separate ASIC device packaged with the sense element provides all of the signal conditioning and communication with the sensor. The complete measurement chain is composed by a low-noise capacitance to voltage amplifier which converts the differential capacitance of the MEMS sensor into an analog voltage that is sent through an analog-to-digital converter. The acceleration data may be accessed through the I<sup>2</sup>C digital communications provided by the ASIC. In addition, the ASIC contains all of the logic to allow the user to choose data rates, g-ranges, filter settings, and interrupt logic. Plus, there are two programmable state machines which allow the user to create unique embedded functions based on changes in acceleration.

### Factory calibration

Kionix trims the offset and sensitivity of each accelerometer by adjusting gain (sensitivity) and 0-g offset trim codes stored in non-volatile memory (OTP). Additionally, all functional register default values are also programmed into the non-volatile memory. Every time the device is turned on or a software reset command is issued, the trimming parameters and default register values are downloaded into the volatile registers to be used during active operation. This allows the device to function without further calibration.

## Application Schematic and Pin Description

### Application Schematic

### Pin Descriptions

Pin	Name	Description
1	SDO/ADDR	Serial Data Out pin during 4 wire SPI communication and part of the device address during I2C communication.
2	SDI/SDA	SPI Data input / I2C Serial Data
3	IO_VDD	The power supply input for the digital communication bus. Optionally decouple this pin to ground with a 0.1uF ceramic capacitor.
4	TRIG	Trigger pin for FIFO buffer control – Connect to GND when not using external trigger option
5	INT1	Physical Interrupt 1. Leave floating if not used.
6	INT2	Physical Interrupt 2. Leave floating if not used.
7	VDD	The power supply input. Decouple this pin to ground with a 0.1uF ceramic capacitor.
8	GND	Ground
9	GND	Ground
10	nCS	SPI enable / I2C mode select. Connect to GND for SPI enabled, I2C communication disabled. Connect to IO_VDD for SPI disabled, I2C communication enabled. Do not leave floating.
11	NC	Not Internally Connected – Can be connected to VDD, IO_VDD, GND or leave floating.
12	SCLK/SCL	SPI and I <sup>2</sup> C Serial Clock

## Digital Interface

The Kionix KX222 digital accelerometer has the ability to communicate via the I<sup>2</sup>C and SPI digital serial interface protocols. This allows for easy system integration by eliminating analog-to-digital converter requirements and by providing direct communication with system micro-controllers.

The serial interface terms and descriptions as indicated in Table 5 below will be observed throughout this document.

Term	Description
Transmitter	The device that transmits data to the bus.
Receiver	The device that receives data from the bus.
Master	The device that initiates a transfer, generates clock signals, and terminates a transfer.
Slave	The device addressed by the Master.

**Table 5:** Serial Interface Terminologies

## I<sup>2</sup>C Serial Interface

As previously mentioned, the KX222 accelerometer has the ability to communicate on an I<sup>2</sup>C bus. I<sup>2</sup>C is primarily used for synchronous serial communication between a Master device and one or more Slave devices. The Master, typically a micro controller, provides the serial clock signal and addresses Slave devices on the bus. The KX222 always operates as a Slave device during standard Master-Slave I<sup>2</sup>C operation.

I<sup>2</sup>C is a two-wire serial interface that contains a Serial Clock (SCL) line and a Serial Data (SDA) line. SCL is a serial clock that is provided by the Master, but can be held low by any Slave device, putting the Master into a wait condition. SDA is a bi-directional line used to transmit and receive data to and from the interface. Data is transmitted MSB (Most Significant Bit) first in 8-bit per byte format, and the number of bytes transmitted per transfer is unlimited. The I<sup>2</sup>C bus is considered free when both lines are high.

The I<sup>2</sup>C interface is compliant with high-speed mode, fast mode and standard mode I<sup>2</sup>C protocols.

## I<sup>2</sup>C Operation

Transactions on the I<sup>2</sup>C bus begin after the Master transmits a start condition (S), which is defined as a high-to-low transition on the data line while the SCL line is held high. The bus is considered busy after this condition. The next byte of data transmitted after the start condition contains the Slave Address (SAD) in the seven MSBs (Most Significant Bits), and the LSB (Least Significant Bit) tells whether the Master will be receiving data ‘1’ from the Slave or transmitting data ‘0’ to the Slave. When a Slave Address is sent, each device on the bus compares the seven MSBs with its internally stored address. If they match, the device considers itself addressed by the Master. The KX222 Slave Address is comprised of a user programmable part, a factory programmable part, and a fixed part, which allows for connection of multiple accelerometers to the same I<sup>2</sup>C bus. The Slave Address associated with the KX222 is 00111YX, where the user programmable bit X, is determined by the assignment of ADDR (pin 1) to GND or IO\_VDD. Also, the factory programmable bit Y is set at the factory. **For KX222-1054, the factory programmable bit Y is fixed to 1** (contact your Kionix sales representative for list of available devices). Table 6 lists possible I<sup>2</sup>C addresses for KX222-1054. As a result, up to four accelerometers can be implemented on a shared I<sup>2</sup>C bus as shown in Figure 1 on the next page (e.g. two KX222-1054 accelerometers and two other accelerometers with factory programmable bit Y set to 0).

Description	Address Pad	7 bit Address	Address	<7>	<6>	<5>	<4>	<3>	Y	X	<0>
									<2>	<1>	
I2C Wr	IO_VDD	0x1F	0x3E	0	0	1	1	1	1	1	0
I2C Rd	IO_VDD	0x1F	0x3F	0	0	1	1	1	1	1	1
I2C Wr	GND	0x1E	0x3C	0	0	1	1	1	1	0	0
I2C Rd	GND	0x1E	0x3D	0	0	1	1	1	1	0	1

**Table 6:** I<sup>2</sup>C Slave Addresses for KX222-1054

It is mandatory that receiving devices acknowledge (ACK) each transaction. Therefore, the transmitter must release the SDA line during this ACK pulse. The receiver then pulls the data line low so that it remains stable low during the high period of the ACK clock pulse. A receiver that has been addressed, whether it is Master or Slave, is obliged to generate an ACK after each byte of data has been received. To conclude a transaction, the Master must transmit a stop condition (P) by transitioning the SDA line from low to high while SCL is high. The I<sup>2</sup>C bus is now free. Note that if the accelerometer is accessed through I<sup>2</sup>C protocol before the startup is finished a NACK signal is sent.

### Writing to accelerometer's 8-bit Register

Upon power up, the Master must write to the KX222 accelerometer's control registers to set its operational mode. Therefore, when writing to a control register on the I<sup>2</sup>C bus, as shown Sequence 1 on the following page, the following protocol must be observed: After a start condition, SAD+W transmission, and the accelerometer's ACK has been returned, an 8-bit Register Address (RA) command is transmitted by the Master. This command is telling the accelerometer to which 8-bit register the Master will be writing the data. Since this is I<sup>2</sup>C mode, the MSB of the RA command should always be zero (0). The accelerometer acknowledges the RA and the Master transmits the data to be stored in the 8-bit register. The accelerometer acknowledges that it has received the data and the Master transmits a stop condition (P) to end the data transfer. The data sent to the accelerometer is now stored in the appropriate register. The accelerometer automatically increments the received RA commands and, therefore, multiple bytes of data can be written to sequential registers after each Slave ACK as shown in Sequence 2 on the following page.

Note\*\* If a STOP condition is sent on the least significant bit of write data or the following master acknowledge cycle, the last write operation is not guaranteed and it may alter the content of the affected registers

### Reading from accelerometer's 8-bit Register

When reading data from a KX222 accelerometer's 8-bit register on the I<sup>2</sup>C bus, as shown in Sequence 3 on the next page, the following protocol must be observed: The Master first transmits a start condition (S) and the appropriate Slave Address (SAD) with the LSB set at '0' to write. The accelerometer acknowledges and the Master transmits the 8-bit RA of the register it wants to read. The accelerometer again acknowledges, and the Master transmits a repeated start condition (Sr). After the repeated start condition, the Master addresses the accelerometer with a '1' in the LSB (SAD+R) to read from the previously selected register. The Slave then acknowledges and transmits the data from the requested register. The Master does not acknowledge (NACK) it received the transmitted data, but transmits a stop condition to end the data transfer. The accelerometer automatically increments through its sequential registers, allowing data to be read from multiple registers following a single SAD+R command as shown below in Sequence 4 on the following page. Reading data from a buffer read register is a special case because if register address (RA) is set to buffer read register (BUF\_READ) in Sequence 4, the register auto-increment feature is automatically disabled. Instead, the Read Pointer will increment to the next data in the buffer, thus allowing reading multiple bytes of data from the buffer using a single SAD+R command.

Note\*\* Accelerometer's output data should be read in a single transaction using the auto-increment feature to prevent output data from being updated prior to intended completion of the read transaction.

### Data Transfer Sequences

The following information clearly illustrates the variety of data transfers that can occur on the I<sup>2</sup>C bus and how the Master and Slave interact during these transfers. Table 7 defines the I<sup>2</sup>C terms used during the data transfers.

Term	Definition
S	Start Condition
Sr	Repeated Start Condition
SAD	Slave Address
W	Write Bit
R	Read Bit
ACK	Acknowledge
NACK	Not Acknowledge
RA	Register Address
Data	Transmitted/Received Data
P	Stop Condition

**Table 7: I<sup>2</sup>C Terms**

**Sequence 1:** The Master is writing one byte to the Slave.

Master	S	SAD + W		RA		DATA		P
Slave			ACK		ACK		ACK	

**Sequence 2:** The Master is writing multiple bytes to the Slave.

Master	S	SAD + W		RA		DATA		DATA		P
Slave			ACK		ACK		ACK		ACK	

**Sequence 3:** The Master is receiving one byte of data from the Slave.

Master	S	SAD + W		RA		Sr	SAD + R			NACK	P
Slave			ACK		ACK			ACK	DATA		

**Sequence 4:** The Master is receiving multiple bytes of data from the Slave.

Master	S	SAD + W		RA		Sr	SAD + R			ACK		NACK	P
Slave			ACK		ACK			ACK	DATA		DATA		

	<b>± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KX222-1054</b> <b>Rev. 1.0</b> <b>26-Sep-16</b>

### HS-mode

To enter the 3.4MHz high speed mode of communication, the device must receive the following sequence of conditions from the master: a Start condition followed by a Master code (00001XXX) and a Master Non-acknowledge. Once recognized, the device switches to HS-mode communication. Read/write data transfers then proceed as described in the sequences above. Devices return to the FS-mode after a STOP occurrence on the bus.

**Sequence 5:** HS-mode data transfer of the Master writing multiple bytes to the Slave.

Speed	FS-mode			HS-mode							FS-mode	
Master	S	M-code	NACK	Sr	SAD + W		RA		DATA		P	
Slave						ACK		ACK		ACK		

n bytes + ack.

**Sequence 6:** HS-mode data transfer of the Master receiving multiple bytes of data from the Slave.

Speed	FS-mode			HS-mode				
Master	S	M-code	NACK	Sr	SAD + W		RA	
Slave						ACK		ACK

Speed	HS-mode							FS-mode
Master	Sr	SAD + R					NACK	P
Slave			ACK	DATA	ACK	DATA		

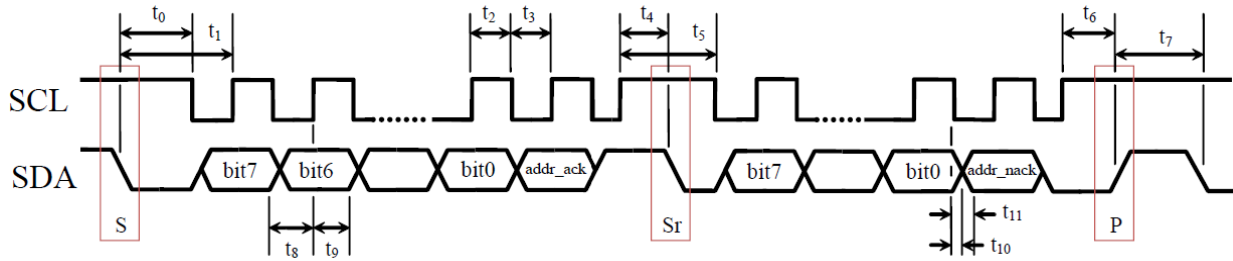

(n-1) bytes + ack.

## SPI Communications

### 4-Wire SPI Interface

The KX222 also utilize an integrated 4-Wire Serial Peripheral Interface (SPI) for digital communication. The SPI interface is primarily used for synchronous serial communication between one Master device and one or more Slave devices. The Master, typically a micro controller, provides the SPI clock signal (SCLK) and determines the state of Chip Select (nCS). The accelerometer always operates as a Slave device during standard Master-Slave SPI operation.

4-wire SPI is a synchronous serial interface that uses two control and two data lines. With respect to the Master, the Serial Clock output (SCLK), the Data Output (SDI or MOSI) and the Data Input (SDO or MISO) are shared among the Slave devices. The Master generates an independent Chip Select (nCS) for each Slave device that goes low at the start of transmission and goes back high at the end. The Slave Data Output (SDO) line, remains in a high-impedance (hi-z) state when the device is not selected, so it does not interfere with any active devices. This allows multiple Slave devices to share a master SPI port as shown in Figure 2 below.

**Figure 2:** 4-wire SPI Connections

## 4-Wire Read and Write Registers

The registers embedded in the KX222 accelerometer have 8-bit addresses. Upon power up, the Master must write to the accelerometer's control registers to set its operational mode. On the falling edge of nCS, a 2-byte command is written to the appropriate control register. The first byte initiates the write to the appropriate register, and is followed by the user-defined, data byte. The MSB (Most Significant Bit) of the register address byte will indicate "0" when writing to the register and "1" when reading from the register. This operation occurs over 16 clock cycles. All commands are sent MSB first. The host must return nCS high for at least one clock cycle before the next data request. However, when data is being read from a buffer read register (BUF\_READ), the nCS signal can remain low until the buffer is read. Figure 3 below shows the timing diagram for carrying out an 8-bit register write operation.

**Figure 3: Timing Diagram for 8-Bit Register Write Operation**

In order to read an 8-bit register, an 8-bit register address must be written to the accelerometer to initiate the read. The MSB of this register address byte will indicate "0" when writing to the register and "1" when reading from the register. Upon receiving the address, the accelerometer returns the 8-bit data stored in the addressed register. This operation also occurs over 16 clock cycles. All returned data is sent MSB first, and the host must return nCS high for at least one clock cycle before the next data request. Figure 4 shows the timing diagram for an 8-bit register read operation.

---	---	---

### 3-Wire SPI Interface

The KX222 also utilize an integrated 3-Wire Serial Peripheral Interface (SPI) for digital communication. 3-wire SPI is a synchronous serial interface that uses two control lines and one data line. With respect to the Master, the Serial Clock output (SCLK), the Data Output/Input (SDI) are shared among the Slave devices. The Master generates an independent Chip Select ( $\overline{\text{CS}}$ ) for each Slave device that goes low at the start of transmission and goes back high at the end. This allows multiple Slave devices to share a master SPI port as shown in Figure 5 below.

### 3-Wire Read and Write Registers

The registers embedded in the KX222 accelerometer have 8-bit addresses. Upon power up, the Master must write to the accelerometer’s control registers to set its operational mode. On the falling edge of nCS, a 2-byte command is written to the appropriate control register. The first byte initiates the write to the appropriate register, and is followed by the user-defined, data byte. The MSB (Most Significant Bit) of the register address byte will indicate “0” when writing to the register and “1” when reading from the register. A read operation occurs over 17 clock cycles and a write operation occurs over 16 clock cycles. All commands are sent MSB first. The host must return nCS high for at least one clock cycle before the next data request. However, when data is being read from a buffer read register (BUF\_READ), the nCS signal can remain low until the buffer is read. Figure 6 below shows the timing diagram for carrying out an 8-bit register write operation.

**Figure 6:** Timing Diagram for 8-Bit Register Write Operation

In order to read an 8-bit register, an 8-bit register address must be written to the accelerometer to initiate the read. The MSB of this register address byte will indicate “0” when writing to the register and “1” when reading from the register. Upon receiving the address, the accelerometer returns the 8-bit data stored in the addressed register. For 3-wire read operations, one extra clock cycle between the address byte and the data output byte is required. Therefore, this operation occurs over 17 clock cycles. All returned data is sent MSB first, and the host must return nCS high for at least one clock cycle before the next data request. Figure 7 shows the timing diagram for an 8-bit register read operation.

**Figure 7:** Timing Diagram for 8-Bit Register Read Operation

## Register Descriptions

### Accelerometer Outputs

These registers contain up to 16-bits of valid acceleration data for each axis. Depending on the setting of the RES bit in CNTL1, the user may choose to read only the 8 MSB thus reading an effective 8-bit resolution. When BRES = 0 in BUF\_CNTL2 the 8 MSB is the only data recorded in the buffer. The data is updated every user-defined ODR period, is protected from overwrite during each read, and can be converted from digital counts to acceleration (g) per Table 12 below. The register acceleration output binary data is represented in 2's complement format. For example, if N = 16 bits, then the Counts range is from -32768 to 32767, and if N = 8 bits, then the Counts range is from -128 to 127.

16-bit Register Data (2's complement)	Equivalent Counts in decimal	Range = ±8g	Range = ±16g	Range = ±32g
0111 1111 1111 1111	32767	+7.99966g	+15.99952g	+31.99904g

### COTR

This register can be used to verify proper integrated circuit functionality. It always has a byte value of 0x55h unless the COTC bit in CNTL2 is set. At that point this value is set to 0xAAh. The byte value is returned to 0x55h after reading this register and the COTC bit in CNTL2 is cleared.

DO	Down State (Y-)
UP	Up State (Y+)
FD	Face-Down State (Z-)
FU	Face-Up State (Z+)

**Table 13:** Tilt Position

### Interrupt Source Registers

These three registers report interrupt state changes. This data is updated when a new interrupt event occurs and each application's result is latched until the interrupt release register is read.

#### INS1

This register indicates the triggering axis when a tap/double tap interrupt occurs. Data is updated at the ODR settings determined by OTDT<2:0> in CNTL3.

R	R	R	R	R	R	R	R

TDO	Y Negative (Y-) Reported
TUP	Y Positive (Y+) Reported
TFD	Z Negative (Z-) Reported
TFU	Z Positive (Z+) Reported

**Table 14:** Directional Tap™ Reporting

## INS2

This Register tells witch function caused an interrupt.

R	R	R	R	R	R	R	R
FFS	BFI	WMI	DRDY	TDTS1	TDTS0	WUFS	TPS
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I <sup>2</sup> C Address: 0x13h							

**FFS** – Free fall. This bit is cleared when the interrupt latch release register (INT\_REL) is read.  
 FFS = 0 – No Free fall  
 FFS = 1 – Free fall has activated the interrupt

**BFI** – indicates buffer full interrupt. Automatically cleared when at least one sample is read from the buffer or following the write to BUF\_CLEAR register.  
 BFI = 0 – Buffer is not full  
 BFI = 1 – Buffer is full

**WMI** – Watermark interrupt, bit is set to 1 when FIFO has filled up to the value stored in the sample bits. This bit is automatically cleared when FIFO/FILO is read and the content returns to a value below the value stored in the sample bits, or following the write to BUF\_CLEAR register.  
 WMI = 0 – Buffer watermark has not been exceeded  
 WMI = 1 – Buffer watermark has been exceeded

**DRDY** – indicates that new acceleration data (0x06h to 0x0Bh) is available. This bit is cleared when acceleration data is read or the interrupt release register INT\_REL is read.  
 DRDY = 0 – new acceleration data not available  
 DRDY = 1 - new acceleration data available

# ± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications

**PART NUMBER:**  
**KX222-1054**  
**Rev. 1.0**  
**26-Sep-16**

**TDTS(1,0)** – status of tap/double tap, bit is released when interrupt release register INT\_REL is read.

TDTS1	TDTS0	Event
0	0	No Tap
0	1	Single Tap
1	0	Double Tap
1	1	Do not exist

**WUFS** – Status of Wake up. This bit is cleared when the interrupt release register INT\_REL is read.

WUFS = 1 – Motion has activated the interrupt

WUFS = 0 – No motion

**TPS** – Tilt Position status. This bit is cleared when the interrupt release register INT\_REL is read.

TPS = 0 – Position not changed

TPS = 1 – Position changed

## INS3

This register reports the axis and direction of detected motion.

R	R	R	R	R	R	R	R
0	0	XNWU	XPWU	YNWU	YPWU	ZNWU	ZPWU
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I <sup>2</sup> C Address: 0x14h							

Bit	Description
XNWU	X Negative (X-) Reported
XPWU	X Positive (X+) Reported
YNWU	Y Negative (Y-) Reported
YPWU	Y Positive (Y+) Reported
ZNWU	Z Negative (Z-) Reported
ZPWU	Z Positive (Z+) Reported

**Table 15:** Motion Detection™ Reporting

# ± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications

**PART NUMBER:**

## STATUS\_REG

This register reports the status of the interrupt.

R	R	R	R	R	R	R	R
0	0	0	INT	0	0	0	0
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I <sup>2</sup> C Address: 0x15h							

**INT** reports the combined (OR) interrupt information of all features. When BFI and WMI in INS2 are 0, the INT bit is released to 0 when INT\_REL is read. If WMI or BFI is 1, INT bit remains at 1 until they are cleared by FIFO/FILO buffer read.

0 = no interrupt event

1 = interrupt event has occurred

## INT\_REL

Latched interrupt source information (INS1, INS2, INS3 except WMI/BFI and INT when WMI/BFI is zero) is cleared and physical interrupt latched pin is changed to its inactive state when this register is read. Read value is dummy.

R	R	R	R	R	R	R	R
X	X	X	X	X	X	X	X
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I <sup>2</sup> C Address: 0x17h							

## CNTL1

Read/write control register that controls the main feature set.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	Reset Value
PC1	RES	DRDYE	GSEL1	GSEL0	TDTE	WUFE	TPE	00000000
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	
I <sup>2</sup> C Address: 0x18h								

**PC1** controls the operating mode of the KX222. Please allow 1.5/ODR delay time when transitioning from stand-by PC1 = 0 to operating mode PC1 = 1 to allow new settings to load.

0 = stand-by mode

1 = operating mode

**RES** determines the performance mode of the KX222. The noise varies with ODR, RES and different LP\_CNTL settings possibly reducing the effective resolution. Note that to change the value of this bit, the PC1 bit must first be set to "0".

0 = low current.

1 = high resolution.

	<b>± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KX222-1054</b> <b>Rev. 1.0</b> <b>26-Sep-16</b>
---	---	---

**DRDYE** enables the reporting of the availability of new acceleration data as an interrupt. Note that to change the value of this bit, the PC1 bit must first be set to “0”.  
0 = availability of new acceleration data is not reflected as an interrupt  
1 = availability of new acceleration data is reflected as an interrupt

**GSEL1, GSEL0** selects the acceleration range of the accelerometer outputs per Table 16. Note that to change the value of this bit, the PC1 bit must first be set to “0”.

GSEL1	GSEL0	Range
0	0	±8g
0	1	±16g
1	0	±32g

**Table 16:** Selected Acceleration Range

**TDTE** enables the Directional Tap™ function that will detect single and double tap events. Note that to change the value of this bit, the PC1 bit must first be set to “0”.  
TDTE = 0 – disable  
TDTE = 1 – enable

**WUFE** enables the Wake Up (motion detect) function. 0= disabled, 1= enabled. Note that to change the value of this bit, the PC1 bit must first be set to “0”.  
0 = Wake Up function disabled  
1 = Wake Up function enabled

**TPE** enables the Tilt Position function that will detect changes in device orientation. Note that to change the value of this bit, the PC1 bit must first be set to “0”.  
TPE = 0 – disable  
TPE = 1 – enable

**CNTL2**

Read/write control register that provides more feature set control. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to “0”.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	Reset Value
SRST	COTC	LEM	RIM	DOM	UPM	FDM	FUM	00111111

# ± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications

**PART NUMBER:**  
**KX222-1054**  
**Rev. 1.0**  
**26-Sep-16**

**SRST** initiates software reset, which performs the RAM reboot routine. This bit will remain 1 until the RAM reboot routine is finished.

SRST = 0 – no action

SRST = 1 – start RAM reboot routine

**COTC** Command test control.

COTC = 0 – no action

COTC = 1 – sets COTR register to 0xAAh and when COTR is read, sets this bit to 0 and sets COTR to 0x55h

**LEM, RIM, DOM, UPM, FDM, FUM** these bits control the tilt axis mask. Per Table 17, if a direction's bit is set to one (1), tilt in that direction will generate an interrupt. If it is set to zero (0), tilt in that direction will not generate an interrupt. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

Bit	Description
LEM	X Negative (X-)
RIM	X Positive (X+)
DOM	Y Negative (Y-)
UPM	Y Positive (Y+)
FDM	Z Negative (Z-)
FUM	Z Positive (Z+)

## CNTL3

This control register sets the output data rates for Tilt, Directional Tap™, and the Motion Wake Up digital engines. The output data rate set in this register and the averaging filter control settings set in LP\_CNTL register, will have an effect on overall performance of the digital engines and the power consumption of the accelerometer. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to “0”.

Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	
I <sup>2</sup> C Address: 0x1Ch								

### **PWSEL1<1:0>** – Pulse interrupt 1 width configuration

00 = 50  $\mu$ s (10  $\mu$ s if OSA > 1600Hz)

01 = 1 \* OSA period

10 = 2 \* OSA periods

11 = 4 \* OSA periods

When **PWSEL1** > 0, Interrupt source auto-clearing (**ACLR1**=1) should be set to keep consistency between the internal status and the physical interrupt.

### **IEN1** enables/disables the physical interrupt pin

**IEN** = 0 – physical interrupt pin is disabled

**IEN** = 1 – physical interrupt pin is enabled

### **IEA1** sets the polarity of the physical interrupt pin

**IEA** = 0 – polarity of the physical interrupt pin is active low

**IEA** = 1 – polarity of the physical interrupt pin is active high

### **IEL1** sets the response of the physical interrupt pin

**IEL** = 0 – the physical interrupt pin latches until it is cleared by reading **INT\_REL**

**IEL** = 1 – the physical interrupt pin will transmit one pulse configurable by **PWSEL1**

### **STPOL** sets the polarity of Self Test

**STPOL** = 0 – Negative

**STPOL** = 1 – Positive

### **SPI3E** sets the 3-wire SPI interface\*

**SPI3E** = 0 – disabled

**SPI3E** = 1 – enabled

\*The **SPI3E** bit should be set to 0 when I<sup>2</sup>C communication is used.

## TDTC

This register contains counter information for the detection of a double tap event. When the Directional Tap™ ODR is 400Hz or less, every count is calculated as 1/ODR delay period. When the Directional Tap™ ODR is 800Hz, every count is calculated as 2/ODR delay period. When the Directional Tap™ ODR is 1600Hz, every count is calculated as 4/ODR delay period. The Directional Tap™ ODR is user-defined per Table 19. The TDTC counts starts at the beginning of the first tap and it represents the minimum time separation between the first tap and the second tap in a double tap event. More specifically, the second tap event must end outside of the TDTC. The Kionix recommended default value is 0.3 seconds (0x78h). Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to “0”.

I <sup>2</sup> C Address: 0x25h								

## TTH

This register represents the 8-bit jerk high threshold to determine if a tap is detected. Though this is an 8-bit register, the register value is internally multiplied by two in order to set the high threshold. This multiplication results in a range of 0d to 510d with a resolution of two counts. The Performance Index (PI) is the jerk signal that is expected to be less than this threshold, but greater than the TTL threshold during single and double tap events. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to “0”. The Kionix recommended default value is 203 (0xCBh) and the Performance Index is calculated as:

$$\begin{aligned}
 X' &= X \text{ (current)} - X \text{ (previous)} \\
 Y' &= Y \text{ (current)} - Y \text{ (previous)} \\
 Z' &= Z \text{ (current)} - Z \text{ (previous)}
 \end{aligned}$$

$$PI = |X'| + |Y'| + |Z'|$$

**Equation 1: Performance Index**

## TTL

This register represents the 8-bit (0d– 255d) jerk low threshold to determine if a tap is detected. The Performance Index (PI) is the jerk signal that is expected to be greater than this threshold and less than the TTH threshold during single and double tap events. The Kionix recommended default value is 26 (0x1Ah). Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to “0”.

## FTD

This register contains counter information for the detection of any tap event. When the Directional Tap™ ODR is 400Hz or less, every count is calculated as 1/ODR delay period. When the Directional Tap™ ODR is 800Hz, every count is calculated as 2/ODR delay period. When the Directional Tap™ ODR is 1600Hz, every count is calculated as 4/ODR delay period. The Directional Tap™ ODR is user-defined per Table 19. In order to ensure that only tap events are detected, these time limits are used. A tap event must be above the performance index threshold for at least the low limit (FTDL0 – FTDL2) and no more than the high limit (FTDH0 – FTDH4). The Kionix recommended default value for the high limit is 0.05 seconds and for the low limit is 0.005 seconds (0xA2h). Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to “0”.

## STD

This register contains counter information for the detection of a double tap event. When the Directional Tap™ ODR is 400Hz or less, every count is calculated as 1/ODR delay period. When the Directional Tap™ ODR is 800Hz, every count is calculated as 2/ODR delay period. When the Directional Tap™ ODR is 1600Hz, every count is calculated as 4/ODR delay period. The Directional Tap™ ODR is user-defined per Table 19. In order to ensure that only tap events are detected, this time limit is used. This register sets the total amount of time that the two taps in a double tap event can be above the PI threshold (TTL). The Kionix recommended default value for STD is 0.09 seconds (0x24h). Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to “0”.

## TLT

This register contains counter information for the detection of a tap event. When the Directional Tap™ ODR is 400Hz or less, every count is calculated as 1/ODR delay period. When the Directional Tap™ ODR is 800Hz, every count is calculated as 2/ODR delay period. When the Directional Tap™ ODR is 1600Hz, every count is calculated as 4/ODR delay period. The Directional Tap™ ODR is user-defined per Table 19. In order to ensure that only tap events are detected, this time limit is used. This register sets the total amount of time that the tap algorithm will count samples that are above the PI threshold (TTL) during a potential tap event. It is used during both single and double tap events. However, reporting of single taps on the physical interrupt pin INT1 or INT2 will occur at the end of the TWS. The Kionix recommended default value for TLT is 0.1 seconds (0x28h). Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to “0”.

## TWS

This register contains counter information for the detection of single and double taps. When the Directional Tap™ ODR is 400Hz or less, every count is calculated as 1/ODR delay period. When the Directional Tap™ ODR is 800Hz, every count is calculated as 2/ODR delay period. When the Directional Tap™ ODR is 1600Hz, every count is calculated as 4/ODR delay period. The Directional Tap™ ODR is user-defined per Table 19. It defines the time window for the entire tap event, single or double, to occur. Reporting of single taps on the physical interrupt pin INT1 or INT2 will occur at the end of this tap window. The Kionix recommended default value for TWS is 0.4 seconds (0xA0h). Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to “0”.

Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
I <sup>2</sup> C Address: 0x3Ah								

**SMP\_TH[9:0] Sample Threshold;** determines the number of samples that will trigger a watermark interrupt or will be saved prior to a trigger event. When BUF\_RES=1, the maximum number of samples is 340; when BUF\_RES=0, the maximum number of samples is 681.

Buffer Model	Sample Function
Bypass	None
FIFO	Specifies how many buffer samples are needed to trigger a watermark interrupt.
Stream	Specifies how many buffer samples are needed to trigger a watermark interrupt.
Trigger	Specifies how many buffer samples before the trigger event are retained in the buffer.
FILO	Specifies how many buffer samples are needed to trigger a watermark interrupt.

**Table 22:** Sample Threshold Operation by Buffer Mode

	<b>± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KX222-1054</b> <b>Rev. 1.0</b> <b>26-Sep-16</b>
---	---	---

### BUF\_CNTL2

Read/write control register that controls sample buffer operation. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to “0”.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
BUFE	BRES	BFIE	0	SMP_TH9	SMP_TH8	BUF_M1	BUF_M0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
I <sup>2</sup> C Address: 0x3Bh								

**BUFE** controls activation of the sample buffer.

*BUFE = 0 – sample buffer inactive*

*BUFE = 1 – sample buffer active*

**BRES** determines the resolution of the acceleration data samples collected by the sample buffer.

*BUF\_RES = 0 – 8-bit samples are accumulated in the buffer*

*BUF\_RES = 1 – 16-bit samples are accumulated in the buffer*

**BFIE** buffer full interrupt enable bit

*BFIE = 0 – buffer full interrupt disabled*

*BFIE = 1 – buffer full interrupt updated in INS2*

**BUF\_M1, BUF\_M0** selects the operating mode of the sample buffer per Table 23.

BUF_M1	BUF_M0	Mode	Description
0	0	FIFO	The buffer collects 681 sets of 8-bit low resolution values or 339 sets of 16-bit high resolution values and then stops collecting data, collecting new data only when the buffer is not full.
0	1	Stream	The buffer holds the last 681 sets of 8-bit low resolution values or 339 sets of 16-bit high resolution values. Once the buffer is full, the oldest data is discarded to make room for newer data.
1	0	Trigger	When a trigger event occurs, the buffer holds the last data set of SMP_TH[9:0] samples before the trigger event and then continues to collect data until full. New data is collected only when the buffer is not full.
1	1	FILO	The buffer holds the last 681 sets of 8-bit low resolution values or 339 sets of 16-bit high resolution values. Once the buffer is full, the oldest data is discarded to make room for newer data. Reading from the buffer in this mode will return the most recent data first.

**Table 23:** Selected Buffer Mode

	<b>± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KX222-1054</b> <b>Rev. 1.0</b> <b>26-Sep-16</b>
---	---	---

### BUF\_STATUS\_1

This register reports the status of the sample buffer.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
SMP_LEV7	SMP_LEV6	SMP_LEV5	SMP_LEV4	SMP_LEV3	SMP_LEV2	SMP_LEV1	SMP_LEV0
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I <sup>2</sup> C Address: 0x3Ch							

**SMP\_LEV[10:0] Sample Level;** reports the number of *data bytes* that have been stored in the sample buffer. When *BUF\_RES=1*, this count will increase by 6 for each 3-axis sample in the buffer; when *BUF\_RES=0*, the count will increase by 3 for each 3-axis sample. If this register reads 0, no data has been stored in the buffer.

### BUF\_STATUS\_2

This register reports the status of the sample buffer trigger function.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
BUF_TRIG	0	0	0	0	SMP_LEV10	SMP_LEV9	SMP_LEV8
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I <sup>2</sup> C Address: 0x3Dh							

**BUF\_TRIG** reports the status of the buffer's trigger function if this mode has been selected. When using trigger mode, a buffer read should only be performed after a trigger event. This bit is also gets cleared after writing to *BUF\_CLEAR* register. This will prevent Buffer Full interrupt from firing while *TRIG* pin remains deasserted.

### BUF\_CLEAR

When any data is written to this register, the entire sample buffer is cleared. This causes the sample level bits *SMP\_LEV[10:0]* to be cleared in *BUF\_STATUS\_1* and *BUF\_STATUS\_2* registers. In addition, if the sample buffer is set to Trigger mode, the *BUF\_TRIG* bit in *BUF\_STATUS\_2* is cleared too. Finally, the *BFI* and *WMI* bits in *INS2* will be cleared and physical interrupt latched pin will be changed to its inactive state.

## Embedded Applications

### Orientation Detection Feature

The orientation detection feature of the KX222 will report changes in face up, face down, ± vertical and ± horizontal orientation. This intelligent embedded algorithm considers very important factors that provide accurate orientation detection from low cost tri-axis accelerometers. Factors such as: hysteresis, device orientation angle and delay time are described below as these techniques are utilized inside the KX222.

#### Hysteresis

A 45° tilt angle threshold seems like a good choice because it is halfway between 0° and 90°. However, a problem arises when the user holds the device near 45°. Slight vibrations, noise and inherent sensor error will cause the acceleration to go above and below the threshold rapidly and randomly, so the screen will quickly flip back and forth between the 0° and the 90° orientations. This problem is avoided in the KX222 by choosing a 30° threshold angle. With a 30° threshold, the screen will not rotate from 0° to 90° until the device is tilted to 60° (30° from 90°). To rotate back to 0°, the user must tilt back to 30°, thus avoiding the screen flipping problem. This example essentially applies ± 15° of hysteresis in between the four screen rotation states. Table 24 shows the acceleration limits implemented for  $\phi_T = 30^\circ$ .

Orientation	X Acceleration (g)	Y Acceleration (g)
0°/360°	$-0.5 < a_x < 0.5$	$a_y > 0.866$
90°	$a_x > 0.866$	$-0.5 < a_y < 0.5$
180°	$-0.5 < a_x < 0.5$	$a_y < -0.866$
270°	$a_x < -0.866$	$-0.5 < a_y < 0.5$

**Table 24:** Acceleration at the four orientations with ± 15° of hysteresis

The KX222 allows the user to change the amount of hysteresis in between the four screen rotation states. By simply writing to the HYST\_SET register, the user can adjust the amount of hysteresis up to ± 45°. The plot in Figure 8 shows the typical amount of hysteresis applied for a given digital count value of HYST\_SET.

**PART NUMBER:**  
**KX222-1054**  
**Rev. 1.0**  
**26-Sep-16**

**Figure 8: HYST\_SET vs Hysteresis**

## Device Orientation Angle (aka Tilt Angle)

To ensure that horizontal and vertical device orientation changes are detected, even when it isn't in the ideal vertical orientation – where the angle  $\theta$  in Figure 9 is  $90^\circ$ , the KX222 considers device orientation angle in its algorithm.

**Figure 9: Device Orientation Angle**

As the angle in Figure 9 is decreased, the maximum gravitational acceleration on the X-axis or Y-axis will also decrease. Therefore, when the angle becomes small enough, the user will not be able to make the screen orientation change. When the device orientation angle approaches  $0^\circ$  (device is flat on a desk

	<b>± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KX222-1054</b> <b>Rev. 1.0</b> <b>26-Sep-16</b>
---	---	---

or table),  $a_x = a_y = 0g$ ,  $a_z = +1g$ , and there is no way to determine which way the screen should be oriented, the internal algorithm determines that the device is in either the face-up or face-down orientation, depending on the sign of the z-axis. The KX222 will only change the screen orientation when the orientation angle is above the factory-defaulted/user-defined threshold set in the TILT\_ANGLE\_LL register. Equation 2 can be used to determine what value to write to the TILT\_ANGLE\_LL register to set the device orientation angle. The value for TILT\_ANGLE\_HL is preset at the factory but can be adjusted in special cases (e.g. to reduce the effect of transient g-variation such as when device is being moved rather than just being rotated).

$$\text{TILT\_ANGLE\_LL (counts)} = \sin \theta * (32 \text{ (counts/g)})$$

**Equation 2:** Tilt Angle Threshold

### Tilt Timer

The 8-bit register, TILT\_TIMER can be used to qualify changes in orientation. The KX222 does this by incrementing a counter with a size that is specified by the value in TILT\_TIMER for each set of acceleration samples to verify that a change to a new orientation state is maintained. A user defined output data rate (ODR) determines the time period for each sample. Equation 3 shows how to calculate the TILT\_TIMER register value for a desired delay time.

$$\text{TILT\_TIMER (counts)} = \text{Delay Time (sec)} \times \text{ODR (Hz)}$$

**Equation 3:** Tilt Position Delay Time

	<b>± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KX222-1054</b> <b>Rev. 1.0</b> <b>26-Sep-16</b>
---	---	---

## Motion Interrupt Feature Description

The Motion interrupt feature of the KX222 reports qualified changes in the high-pass filtered acceleration based on the Wake Up (ATH) threshold. If the high-pass filtered acceleration on any axis is greater than the user-defined wake up threshold (ATH), the device has transitioned from an inactive state to an active state. Equation 4 shows how to calculate the ATH register value for a desired wake up threshold.

$$\text{ATH (counts)} = \text{Wake Up Threshold (g)} \times 4 \text{ (counts/g)}$$

### Equation 4: Wake Up Threshold

An 8-bit raw unsigned value represents a counter that permits the user to qualify each active/inactive state change. Note that each WUFC Timer count qualifies 1 (one) user-defined ODR period (OWUF). Equation 5 shows how to calculate the WUFC register value for a desired wake up delay time.

$$\text{WUFC (counts)} = \text{Wake Up Delay Time (sec)} \times \text{OWUF (Hz)}$$

### Equation 5: Wake Up Delay Time

The latched motion interrupt response algorithm works as following: while the part is in inactive state, the algorithm evaluates differential measurement between each new acceleration data point with the preceding one and evaluates it against the ATH threshold. When the differential measurement is greater than ATH threshold, the wakeup counter starts the count. Differential measurements are now calculated based on the difference between the current acceleration and the acceleration when the counter started. The part will report that motion has occurred at the end of the count assuming each differential measurement has remained above the threshold. If at any moment during the count the differential measurement falls below the threshold, the counter will stop the count and the part will remain in inactive state.

To illustrate how the algorithm works, consider the Figure 10 below that shows the latched response of the motion detection algorithm with WUF Timer (WUFC) set to 10 counts. Note how the difference between the acceleration sample marked in red and the one marked in green resulted in a differential measurements represented with orange bar being above the WUF threshold. At this point, the counter begins to count number of counts stored in WUFC register and the wakeup algorithm will evaluate the difference between each new acceleration measurement and the measurement marked in green that will remain a reference measurement for the duration of the counter count. At the end of the count, assuming all differential measurements were larger than WUF threshold, as is the case in the example showed in Figure 10, a motion event will be reported.

---	---	--

### Directional Tap Detection Feature Description

The Directional Tap Detection feature of the KX222 recognizes single and double tap inputs and reports the acceleration axis and direction that each tap occurred. Eight performance parameters, as well as a user-selectable ODR are used to configure the KX222 for a desired tap detection response.

### Performance Index

The Directional Tap™ detection algorithm uses low and high thresholds to help determine when a tap event has occurred. A tap event is detected when the previously described jerk summation exceeds the low threshold (TTL) for more than the tap detection low limit, but less than the tap detection high limit as contained in FTD. Samples that exceed the high limit (TTH) will be ignored. Figure 11 shows an example of a single tap event meeting the performance index criteria.

**Figure 11: Jerk Summation vs Threshold**

# ± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications

**PART NUMBER:**  
KX222-1054  
Rev. 1.0  
26-Sep-16

## Single Tap Detection

The latency timer (TLT) sets the time period that a tap event will only be characterized as a single tap. A second tap has to occur outside of the latency timer. If a second tap occurs inside the latency time, it will be ignored as it occurred too quickly. The single tap will be reported at the end of the TWS. Figure 12 shows a single tap event meeting the PI, latency and window requirements.

**Figure 12:** Single Directional TapTM Timing

# ± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications

**PART NUMBER:**  
KX222-1054  
Rev. 1.0  
26-Sep-16

## Double Tap Detection

An event can be characterized as a double tap if the second tap crosses the performance index (TTL) inside the TWS period and ends outside the TDTC. This means that the TDTC determines the minimum time separation that must exist between the two taps of a double tap event. Similar to the single tap, the first tap event must exceed the performance index for the time limit contained in FTD. Also, the duration when the first and second events combined exceed the performance index should not exceed STD. The double tap will be reported at the end of the second TLT. Figure 13 shows a double tap event meeting the PI, latency and window requirements.

---	---	---

### Free fall Detect

The KX222 features a Free fall interrupt that sends a flag through INT1 or INT2 when the accelerometer senses a Free fall event. A Free fall event is evident when all three accelerometer axes simultaneously fall below a certain acceleration threshold for a set amount of time. The KX222 gives the user the option to define the acceleration threshold value through the FFTH 8-bit register where 256 counts cover the g range of the accelerometer. This value is compared to the top 8 bits of the accelerometer 8g output.

Through the Free Fall Counter (FFC), the user can set the amount of time all three accelerometer axes must simultaneously remain below the FFTH acceleration threshold before the Free fall interrupt flag is sent through INT1 or INT2. This delay/debounce time is defined by the available 0 to 255 counts, which represent accelerometer samples taken at the rate defined by OFFI<2:0>. Every count is calculated as 1/ODR delay period.

When the Free fall interrupt is enabled the part must not be in a physical state that would trigger the Free fall interrupt or the delay will not be correct for the present Free fall.

## Sample Buffer Feature Description

The sample buffer feature of the KX222 accumulates and outputs acceleration data based on how it is configured. There are 4 buffer modes available, and samples can be accumulated at either low (8-bit) or high (16-bit) resolution. Acceleration data is collected at the ODR specified by OSA[3:0] in the ODCNTL register. Each buffer mode accumulates data, reports data, and interacts with status indicators in a slightly different way.

### FIFO Mode

#### Data Accumulation

Sample collection stops when the buffer is full.

#### Data Reporting

Data is reported with the oldest byte of the oldest sample first (X<sub>L</sub> or X based on resolution).

#### Status Indicators

A watermark interrupt occurs when the number of samples in the buffer reaches the Sample Threshold. The watermark interrupt stays active until the buffer contains less than this number of samples. This can be accomplished through clearing the buffer or explicitly reading greater than SMPX samples (calculated with Equation 6).

BUF\_RES=0:

$$SMPX = SMP\_LEV[10:0] / 3 - SMP\_TH[9:0]$$

BUF\_RES=1:

$$SMPX = SMP\_LEV[10:0] / 6 - SMP\_TH[9:0]$$

**Equation 6:** Samples Above Sample Threshold

### Stream Mode

#### Data Accumulation

Sample collection continues when the buffer is full; older data is discarded to make room for newer data.

#### Data Reporting

Data is reported with the oldest sample first (uses FIFO read pointer).

#### Status Indicators

A watermark interrupt occurs when the number of samples in the buffer reaches the Sample Threshold. The watermark interrupt stays active until the buffer contains less than this number of samples. This can be accomplished through clearing the buffer or explicitly reading greater than SMPX samples (calculated with Equation 6).

	<b>± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KX222-1054</b> <b>Rev. 1.0</b> <b>26-Sep-16</b>
---	---	---

## Trigger Mode

### Data Accumulation

When a physical interrupt is caused by one of the digital engines or when a logic high signal occurs on the TRIG pin, the trigger event is asserted and SMP\_TH[9:0] samples prior to the event are retained. Sample collection continues until the buffer is full.

### Data Reporting

Data is reported with the oldest sample first (uses FIFO read pointer).

### Status Indicators

When a physical interrupt occurs and there are at least SMP\_TH[9:0] samples in the buffer, BUF\_TRIG in BUF\_STATUS\_2 is asserted.

## FILO Mode

### Data Accumulation

Sample collection continues when the buffer is full; older data is discarded to make room for newer data.

### Data Reporting

Data is reported with the newest byte of the newest sample first (Z\_H or Z based on resolution).

### Status Indicators

A watermark interrupt occurs when the number of samples in the buffer reaches the Sample Threshold. The watermark interrupt stays active until the buffer contains less than this number of samples. This can be accomplished through clearing the buffer or explicitly reading greater than SMPX samples (calculated with Equation 6).

## Buffer Operation

The following diagrams illustrate the operation of the buffer conceptually. Actual physical implementation has been abstracted to offer a simplified explanation of how the different buffer modes operate. Figure 16 represents a high-resolution 3-axis sample within the buffer. Figure 17 – Figure 25 represent a 10-sample version of the buffer (for simplicity), with Sample Threshold set to 8.

Regardless of the selected mode, the buffer fills sequentially, one byte at a time. Figure 16 shows one 6-byte data sample. Note the location of the FILO read pointer versus that of the FIFO read pointer.

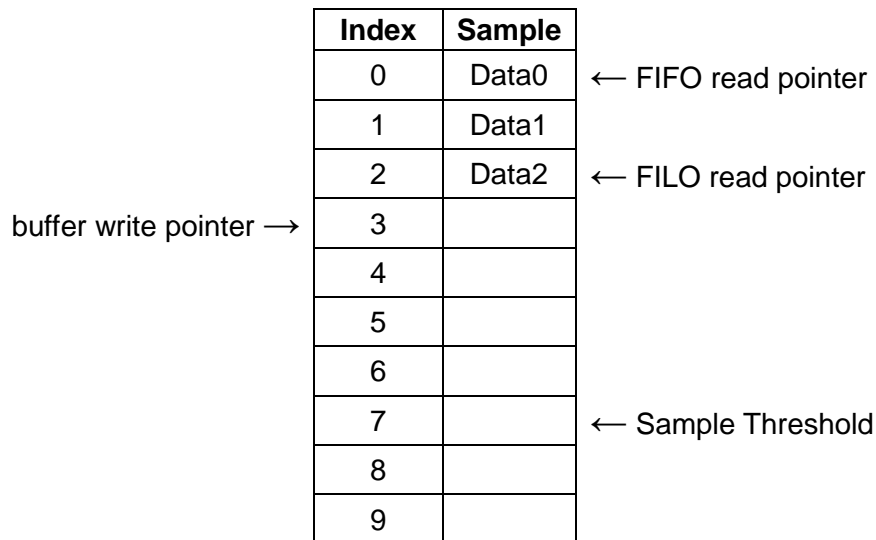

**± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications**

**PART NUMBER:**  
**KX222-1054**  
**Rev. 1.0**  
**26-Sep-16**

**Figure 16: One Buffer Sample**

Regardless of the selected mode, the buffer fills sequentially, one sample at a time. Note in Figure 17 the location of the FILO read pointer versus that of the FIFO read pointer. The buffer write pointer shows where the next sample will be written to the buffer.

**Figure 17: Buffer Filling**

The buffer continues to fill sequentially until the Sample Threshold is reached. Note in Figure 18 the location of the FILO read pointer versus that of the FIFO read pointer.

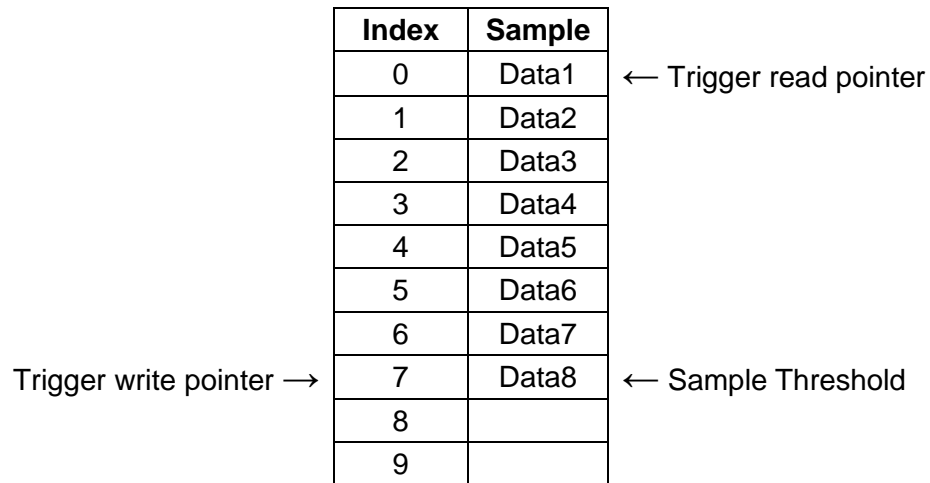

**Figure 18: Buffer Approaching Sample Threshold**

In FIFO, Stream, and FILO modes, a watermark interrupt is issued when the number of samples in the buffer reaches the Sample Threshold. In trigger mode, this is the point where the oldest data in the buffer is discarded to make room for newer data.

**Figure 19: Buffer at Sample Threshold**

In trigger mode, data is accumulated in the buffer sequentially until the Sample Threshold is reached. Once the Sample Threshold is reached, the oldest samples are discarded when new samples are collected. Note in Figure 20 how Data0 was thrown out to make room for Data8.

**Figure 20:** Additional Data Prior to Trigger Event

After a trigger event occurs, the buffer no longer discards the oldest samples, and instead begins accumulating samples sequentially until full. The buffer then stops collecting samples, as seen in Figure 21. This results in the buffer holding SMP\_TH[9:0] samples prior to the trigger event, and SMPX samples after the trigger event.

**Figure 21:** Additional Data after Trigger Event

In FIFO, Stream, FILO, and Trigger (after a trigger event has occurred) modes, the buffer continues filling sequentially after the Sample Threshold is reached. Sample accumulation after the buffer is full depends on the selected operation mode. FIFO and Trigger modes stop accumulating samples when the buffer is full, and Stream and FILO modes begin discarding the oldest data when new samples are accumulated.

## Notice

### Precaution on using KIONIX Products

1. Our Products are designed and manufactured for application in ordinary electronic equipment (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment (Note 1), transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property (“Specific Applications”), please consult with the KIONIX sales representative in advance. Unless otherwise agreed in writing by KIONIX in advance, KIONIX shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any KIONIX’s Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASS III	CLASS III	CLASS II b	CLASS III
CLASS IV		CLASS III	

2. KIONIX designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
  - a) Installation of protection circuits or other protective devices to improve system safety
  - b) Installation of redundant circuits to reduce the impact of single or multiple circuit failure
3. Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, KIONIX shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any KIONIX’s Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc., prior to use, must be necessary:
  - a) Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
  - b) Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
  - c) Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl2, H2S, NH3, SO2, and NO2
  - d) Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
  - e) Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
  - f) Sealing or coating our Products with resin or other coating materials
  - g) Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
  - h) Use of the Products in places subject to dew condensation
4. The Products are not subject to radiation-proof design.
5. Please verify and confirm characteristics of the final or mounted products in using the Products.
6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying

	<b>± 8g / 16g / 32g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KX222-1054</b> <b>Rev. 1.0</b> <b>26-Sep-16</b>
---	---	---

power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.

7. De-rate Power Dissipation (Pd) depending on ambient temperature (Ta). When used in sealed area, confirm the actual ambient temperature.
8. Confirm that operation temperature is within the specified range described in the product specification.
9. KIONIX shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

### **Precaution for Mounting / Circuit board design**

1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
2. In principle, the reflow soldering method must be used; if flow soldering method is preferred, please consult with the KIONIX representative in advance.

For details, please refer to KIONIX Mounting specification.

### **Precautions Regarding Application Examples and External Circuits**

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. KIONIX shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

### **Precaution for Electrostatic**

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

### **Precaution for Storage / Transportation**

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
  - a) the Products are exposed to sea winds or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - b) the temperature or humidity exceeds those recommended by KIONIX
  - c) the Products are exposed to direct sunshine or condensation
  - d) the Products are exposed to high Electrostatic
2. Even under KIONIX recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

### **Precaution for Product Label**

QR code printed on KIONIX Products label is for KIONIX's internal use only.

### **Precaution for Disposition**

When disposing Products please dispose them properly using an authorized industry waste company.

### **Precaution for Foreign Exchange and Foreign Trade act**

Since our Products might fall under controlled goods prescribed by the applicable foreign exchange and foreign trade act, please consult with KIONIX representative in case of export.

### **Precaution Regarding Intellectual Property Rights**

1. All information and data including but not limited to application example contained in this document is for reference only. KIONIX does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.
2. KIONIX shall not be in any way responsible or liable for infringement of any intellectual property rights or other damages arising from use of such information or data.
3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of KIONIX or any third parties with respect to the information contained in this document.

### **Other Precaution**

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of KIONIX.
2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of KIONIX.
3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
4. The proper names of companies or products described in this document are trademarks or registered trademarks of KIONIX, its affiliated companies or third parties.

### **General Precaution**

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. KIONIX shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any KIONIX's Products against warning, caution or note contained in this document.
2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using KIONIX's Products, please confirm the latest information with a KIONIX sales representative.
3. The information contained in this document is provided on an "as is" basis and KIONIX does not warrant that all information contained in this document is accurate and/or error-free. KIONIX shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.

## X-ON Electronics

Largest Supplier of Electrical and Electronic Components
