

± 2g / 4g / 8g / 16g Tri-axis Digital Accelerometer Specifications

PART NUMBER:
KXTJ3-1057
Rev. 2.0
10-Nov-16

Product Description

The KXTJ3-1057 is a tri-axis ±2g, ±4g, ±8g or ±16g silicon micromachined accelerometer. The sense element is fabricated using Kionix's proprietary plasma micromachining process technology. Acceleration sensing is based on the principle of a differential capacitance arising from acceleration-induced motion of the sense element, which further utilizes common mode cancellation to decrease errors from process variation, temperature, and environmental stress. The sense element is hermetically sealed at the wafer level by bonding a second silicon lid wafer to the device using a glass frit. A separate ASIC device packaged with the sense element provides signal conditioning and digital communications. The accelerometer is delivered in a 2 x 2 x 0.9 mm LGA plastic package operating from a 1.71V – 3.6V DC supply. Voltage regulators are used to maintain constant internal operating voltages over the range of input supply voltages. This results in stable operating characteristics over the range of input supply voltages and virtually undetectable ratiometric error. The I²C digital protocol is used to communicate with the chip to configure the part and monitor outputs.

Features

- Small footprint: 2 x 2 x 0.9 mm LGA 12-pin package (pin-to-pin compatible with KXTJ2)
- Low current consumption: 0.9 µA in standby, 10 µA in Low Power, and 155 µA in High Resolution modes
- Extended user-configurable g-ranges: ±2g, ±4g, ±8g, ±16g
- 8-bit, 12-bit, and 14-bit resolution modes
- Wide supply voltage range: 1.71 V to 3.6 V with internal voltage regulator
- High resolution Wake-Up function with threshold configurable down to 3.9 mg
- User-configurable Output Data Rates from 0.781Hz to 1600Hz
- I²C digital communication interface up to 3.4MHz
- Highly configurable interrupt control
- Embedded Low Pass filter
- Improved design to virtually eliminate post reflow Offset and Sensitivity shift
- Improved noise performance
- Stable performance over temperature
- High shock survivability
- Self-test function
- RoHS / REACH compliant

Product Specifications

Mechanical

(Specifications are for operation at 2.5V and T = 25°C unless stated otherwise)

Parameters	Units	Min	Typical	Max
Operating Temperature Range	°C	-40	-	85
Zero-g Offset	mg		±25	
Zero-g Offset Variation from RT over Temp.	mg/°C		0.2	
Sensitivity (14-bit) ^{1,2}	± 8g	counts/g	1024	
	± 16g		512	
Sensitivity (12-bit) ¹	± 2g	counts/g	1024	
	± 4g		512	
	± 8g		256	
	± 16g		128	
Sensitivity (8-bit) ¹	± 2g	counts/g	64	
	± 4g		32	
	± 8g		16	
	± 16g		8	
Sensitivity Variation from RT over Temp.	%/°C		0.01	
Positive Self-test Output change on Activation ⁴	g		0.5	
Mechanical Resonance (-3dB) ³	Hz		3500 (xy) 1800 (z)	
Non-Linearity	% of FS		0.6	
Cross Axis Sensitivity	%		2	
Noise Density (High Resolution Mode RES = 1 at 50Hz ODR)	μg / √Hz		150	

Table 1: Mechanical Specifications

Notes:

- Resolution and acceleration ranges are user selectable via I2C and via CTRL_REG1 register.
- 14-bit Resolution is only available for registers 0x06h – 0x0Bh in the 8g or 16g High Resolution mode
- Resonance as defined by the dampened mechanical sensor.
- Self-test can be exercised by setting STPOL bit = 1 in INT_CTRL_REG1, then writing 0xCA to the SELF_TEST register.

Electrical

(specifications are for operation at 2.5V and T = 25°C unless stated otherwise)

Parameters		Units	Min	Typical	Max
Supply Voltage (VDD)	Operating	V	1.71	2.5	3.6
I/O Pads Supply Voltage (IO_VDD)		V	1.7		VDD
Current Consumption	High Resolution Mode (RES = 1)	μA		155	
	Low Power Mode ¹ (RES = 0)			10	
	Disabled			0.9	
Output Low Voltage (IO_VDD < 2V) ²		V	-	-	0.2 * IO_VDD
Output Low Voltage (IO_VDD ≥ 2V) ²		V	-	-	0.4
Output High Voltage		V	0.8 * IO_VDD	-	-
Input Low Voltage		V	-	-	0.2 * IO_VDD
Input High Voltage		V	0.8 * IO_VDD	-	-
Input Pull-down Current		μA		0	
Start Up Time ³		ms		~1/ODR	
Power Up Time ⁴		ms		12	30
I ² C Communication Rate		MHz			3.4
Output Data Rate (ODR) ⁵		Hz	0.781	50	1600
Bandwidth (-3dB) ⁶	RES = 0	Hz		800	
	RES = 1	Hz		ODR/2	

Table 2: Electrical Specifications

Notes:

1. Current varies with Output Data Rate (ODR) see table below.
2. For I²C communication, this assumes a minimum 1.5kΩ pull-up resistor on SCL and SDA pins.
3. Start up time is from PC1 set to valid outputs. Time varies with Output Data Rate (ODR). See *Table 3: Start Up Time* for details.
4. Power up time is from VDD and IO_VDD valid to device boot completion.
5. User selectable through I²C.
6. User selectable and dependent on ODR and RES.

---	---	---

Power-On Procedure

Proper functioning of power-on reset (POR) is dependent on the specific **VDD**, **VDD_{Low}**, **T_{VDD}** (rise time), and **T_{VDD_OFF}** profile of individual applications. It is recommended to minimize **VDD_{Low}**, and **T_{VDD}**, and maximize **T_{VDD_OFF}**. It is also advised that the **VDD** ramp up time **T_{VDD}** be monotonic. Note that the outputs will not be stable until **VDD** has reached its final value.

- ! *To assure proper POR, the application should be evaluated over the customer specified range of VDD, VDD_{Low}, T_{VDD}, T_{VDD_OFF} and temperature as POR performance can vary depending on these parameters.*

Please refer to Technical Note [TN017 KXTJ3 Accelerometer Power-On Procedure](#) for more information.

Caution: ESD Sensitive and Mechanical Shock Sensitive Component, improper handling can cause permanent damage to the device.

These products conform to RoHS Directive 2011/65/EU of the European Parliament and of the Council of the European Union that was issued June 8, 2011. Specifically, these products do not contain any non-exempted amounts of lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB) or polybrominated diphenyl ethers (PBDE) above the maximum concentration values (MCV) by weight in any of its homogenous materials.

Homogenous materials are “of uniform composition throughout”. The MCV for lead, mercury, hexavalent chromium, PBB, and PBDE is 0.10%. The MCV for cadmium is 0.010%.

Applicable Exemption: *7C-1 - Electrical and electronic components containing lead in a glass or ceramic other than dielectric ceramic in capacitors (piezoelectronic devices) or in a glass or ceramic matrix compound.*

These products are also in conformance with REACH Regulation No 1907/2006 of the European Parliament and of the Council that was issued Dec. 30, 2011. They do not contain any Substances of Very High Concern (SVHC-161) as identified by the European Chemicals Agency as of 17 December 2014.

This product is halogen-free per IEC 61249-2-21. Specifically, the materials used in this product contain a maximum total halogen content of 1500 ppm with less than 900-ppm bromine and less than 900-ppm chlorine.

Soldering

Soldering recommendations are available upon request or from www.kionix.com.

Floor Life

Factory floor life exposure of the KXTJ3 reels removed from the moisture barrier bag should not exceed a maximum of 168 hours at 30C/60%RH. If this floor life is exceeded, the parts should be dried per the IPC/JEDEC J-STD-033A standard.

	± 2g / 4g / 8g / 16g Tri-axis Digital Accelerometer Specifications	PART NUMBER: KXTJ3-1057 Rev. 2.0 10-Nov-16
---	---	---

Terminology

g

A unit of acceleration equal to the acceleration of gravity at the earth's surface.

$$1g = 9.8 \frac{m}{s^2}$$

One thousandth of a g (0.0098 m/ s²) is referred to as 1 milli-g (1 mg).

Sensitivity

The sensitivity of an accelerometer is the change in output per unit of input acceleration at nominal VDD and temperature. The term is essentially the gain of the sensor expressed in counts per g (counts/g) or LSB's per g (LSB/g). Occasionally, sensitivity is expressed as a resolution, i.e. milli-g per LSB (mg/LSB) or milli-g per count (mg/count). Sensitivity for a given axis is determined by measurements of the formula:

$$Sensitivity = \frac{(Output @+1g - Output @-1g)}{2g}$$

The sensitivity tolerance describes the range of sensitivities that can be expected from a large population of sensors at room temperature and over life. When the temperature deviates from room temperature (25°C), the sensitivity will vary by the amount shown in Table 1.

Zero-g offset

Zero-g offset or 0-g offset describes the actual output of the accelerometer when no acceleration is applied. Ideally, the output would always be in the middle of the dynamic range of the sensor (content of the OUTX, OUTY, OUTZ registers = 00h, expressed as a 2's complement number). However, because of mismatches in the sensor, calibration errors, and mechanical stress, the output can deviate from 00h. This deviation from the ideal value is called 0-g offset. The zero-g offset tolerance describes the range of 0-g offsets of a population of sensors over the operating temperature range.

Self-test

Self-test allows a functional test of the sensor without applying a physical acceleration to it. When activated, an electrostatic force is applied to the sensor, simulating an input acceleration. The sensor outputs respond accordingly. If the output signals change within the amplitude specified in Table 1, then the sensor is working properly and the parameters of the interface chip are within the defined specifications.

Application Schematic

Pin Descriptions

Pin	Name	Description
1	ADDR ⁵	I ² C programmable address bit. Must be connected to IO_VDD or GND
2	SDA	I ² C Serial Data
3	IO_VDD ¹	The power supply input for the digital communication bus. Optionally decouple this pin to ground with a 0.1µF ceramic capacitor.
4	RES ⁴	Reserved. Connect to GND. Do not leave floating.
5	INT	Physical Interrupt pin. Leave floating if not used
6	GND ²	Ground
7	VDD ³	The power supply input. Decouple this pin to ground with a 0.1µF ceramic capacitor.
8	GND ²	Ground
9	GND ²	Ground
10	VDD ³	The power supply input. Decouple this pin to ground with a 0.1µF ceramic capacitor.
11	IO_VDD ¹	The power supply input for the digital communication bus. Optionally decouple this pin to ground with a 0.1µF ceramic capacitor.
12	SCL	I ² C Serial Clock

Table 5: Pin Descriptions

Notes:

- IO_VDD Pins 3, and 11 are internally tied together. For backwards compatibility with other parts, one of the two pins may be left floating.
- GND Pins 6, 8, and 9 are internally tied together. For backwards compatibility with other parts, any two of the three pins may be left floating.
- VDD Pins 7, and 10 are internally tied together. For backwards compatibility with other parts, one of the two pins may be left floating.
- RES Pin 4 can be optionally tied to IO_VDD or VDD instead.
- See Digital Interface section for connection details.

Digital Interface

The Kionix KXTJ3 digital accelerometer has the ability to communicate on the I²C digital serial interface bus. This allows for easy system integration by eliminating analog-to-digital converter requirements and by providing direct communication with system micro-controllers.

The serial interface terms and descriptions as indicated in Table 6 will be observed throughout this document.

Term	Description
Transmitter	The device that transmits data to the bus.
Receiver	The device that receives data from the bus.
Master	The device that initiates a transfer, generates clock signals, and terminates a transfer.
Slave	The device addressed by the Master.

Table 6: Serial Interface Terminologies

I²C Serial Interface

As previously mentioned, the KXTJ3 has the ability to communicate on an I²C bus. I²C is primarily used for synchronous serial communication between a Master device and one or more Slave devices. The Master, typically a micro controller, provides the serial clock signal and addresses Slave devices on the bus. The KXTJ3 always operates as a Slave device during standard Master-Slave I²C operation.

I²C is a two-wire serial interface that contains a Serial Clock (SCL) line and a Serial Data (SDA) line. SCL is a serial clock that is provided by the Master, but can be held low by any Slave device, putting the Master into a wait condition. SDA is a bi-directional line used to transmit and receive data to and from the interface. Data is transmitted MSB (Most Significant Bit) first in 8-bit per byte format, and the number of bytes transmitted per transfer is unlimited. The I²C bus is considered free when both lines are high. The I²C interface is compliant with high-speed mode, fast mode and standard mode I²C standards.

I²C Operation

Transactions on the I²C bus begin after the Master transmits a start condition (S), which is defined as a high-to-low transition on the data line while the SCL line is held high. The bus is considered busy after this condition. The next byte of data transmitted after the start condition contains the Slave Address (SAD) in the seven MSBs (Most Significant Bits), and the LSB (Least Significant Bit) tells whether the Master will be receiving data '1' from the Slave or transmitting data '0' to the Slave. When a Slave Address is sent, each device on the bus compares the seven MSBs with its internally stored address. If they match, the device considers itself addressed by the Master. The KXTJ3's Slave Address is comprised of a programmable part and a fixed part, which allows for connection of multiple KXTJ3's to the same I²C bus. The Slave Address associated with the KXTJ3 is 000111X, where the programmable bit X is determined by the assignment of ADDR (pin 1) to GND or IO_VDD (Table 7). Also, Figure 2 shows how two KXTJ3's would be implemented on the same I²C bus.

It is mandatory that receiving devices acknowledge (ACK) each transaction. Therefore, the transmitter must release the SDA line during this ACK pulse. The receiver then pulls the data line low so that it remains stable low during the high period of the ACK clock pulse. A receiver that has been addressed, whether it is Master or Slave, is obliged to generate an ACK after each byte of data has been received. To conclude a transaction, the Master must transmit a stop condition (P) by transitioning the SDA line from low to high while SCL is high. The I²C bus is now free. Note that if the KXTJ3 is accessed through I²C protocol before the startup is finished a NACK signal is sent.

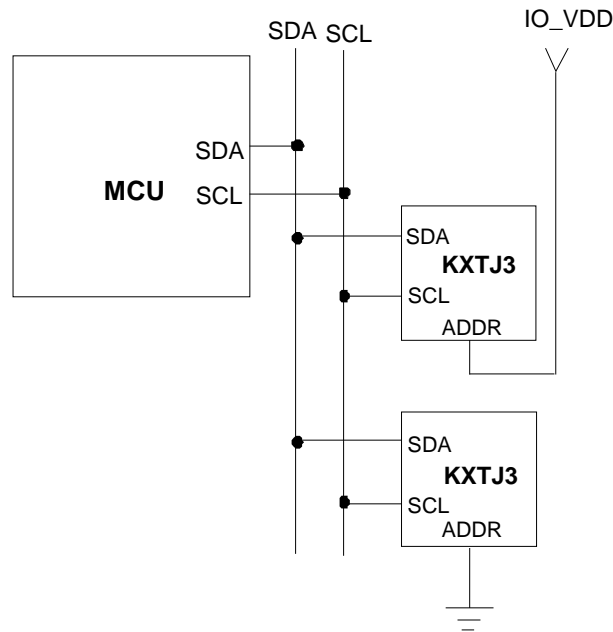

Figure 2. Multiple KXTJ3 I²C Connection

Description	Address Pad	7 bit Address	Address	<7>	<6>	<5>	<4>	<3>	<2>	X

Writing to a KXTJ3 8-bit Register

Upon power up, the Master must write to the KXTJ3's control registers to set its operational mode. Therefore, when writing to a control register on the I²C bus, as shown Sequence 1 below, the following protocol must be observed: After a start condition, SAD+W transmission, and the KXTJ3 ACK has been returned, an 8-bit Register Address (RA) command is transmitted by the Master. This command is telling the KXTJ3 to which 8-bit register the Master will be writing the data. Since this is I²C mode, the MSB of the RA command should always be zero (0). The KXTJ3 acknowledges the RA and the Master transmits the data to be stored in the 8-bit register. The KXTJ3 acknowledges that it has received the data and the Master transmits a stop condition (P) to end the data transfer. The data sent to the KXTJ3 is now stored in the appropriate register. The KXTJ3 automatically increments the received RA commands and, therefore, multiple bytes of data can be written to sequential registers after each Slave ACK as shown in Sequence 2 on the following page.

Note** If a STOP condition is sent on the least significant bit of write data or the following master acknowledge cycle, the last write operation is not guaranteed and it may alter the content of the affected registers.

Reading from a KXTJ3 8-bit Register

When reading data from a KXTJ3 8-bit register on the I²C bus, as shown in Sequence 3 on the next page, the following protocol must be observed: The Master first transmits a start condition (S) and the appropriate Slave Address (SAD) with the LSB set at '0' to write. The KXTJ3 acknowledges and the Master transmits the 8-bit RA of the register it wants to read. The KXTJ3 again acknowledges, and the Master transmits a repeated start condition (Sr). After the repeated start condition, the Master addresses the KXTJ3 with a '1' in the LSB (SAD+R) to read from the previously selected register. The Slave then acknowledges and transmits the data from the requested register. The Master does not acknowledge (NACK) it received the transmitted data, but transmits a stop condition to end the data transfer. Note that the KXTJ3 automatically increments through its sequential registers, allowing data to be read from multiple registers following a single SAD+R command as shown below in Sequence 4. The 8-bit register data is transmitted using a left-most format, first bit shifted/clocked out being the MSB bit. If a receiver cannot transmit or receive another complete byte of data until it has performed some other function, it can hold SCL low to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases SCL.

Note** Accelerometer's output data should be read in a single transaction using the auto-increment feature to prevent output data from being updated prior to intended completion of the read transaction.

Data Transfer Sequences

The following information clearly illustrates the variety of data transfers that can occur on the I²C bus and how the Master and Slave interact during these transfers. Table 8 defines the I²C terms used during the data transfers.

Term	Definition
S	Start Condition
Sr	Repeated Start Condition
SAD	Slave Address
W	Write Bit
R	Read Bit
ACK	Acknowledge
NACK	Not Acknowledge
RA	Register Address
Data	Transmitted/Received Data
P	Stop Condition

Table 8. I²C Terms

Sequence 1. The Master is writing one byte to the Slave.

Master	S	SAD + W		RA		DATA		P
Slave			ACK		ACK		ACK	

Sequence 2. The Master is writing multiple bytes to the Slave.

Master	S	SAD + W		RA		DATA		DATA		P
Slave			ACK		ACK		ACK		ACK	

Sequence 3. The Master is receiving one byte of data from the Slave.

Master	S	SAD + W		RA		Sr	SAD + R			NACK	P
Slave			ACK		ACK			ACK	DATA		

Sequence 4. The Master is receiving multiple bytes of data from the Slave.

Master	S	SAD + W		RA		Sr	SAD + R			ACK		NACK	P
Slave			ACK		ACK			ACK	DATA		DATA

---	---	---

HS-mode

To enter the 3.4MHz high speed mode of communication, the device must receive the following sequence of conditions from the master: a Start condition followed by a Master code (00001XXX) and a Master Non-acknowledge. Once recognized, the device switches to HS-mode communication. Read/write data transfers then proceed as described in the sequences above. Devices return to the FS-mode after a STOP occurrence on the bus.

Sequence 5: HS-mode data transfer of the Master writing multiple bytes to the Slave.

Speed	FS-mode			HS-mode							FS-mode	
Master	S	M-code	NACK	Sr	SAD + W		RA		DATA		P	
Slave						ACK		ACK		ACK		

n bytes + ack.

Sequence 6: HS-mode data transfer of the Master receiving multiple bytes of data from the Slave.

Speed	FS-mode			HS-mode				
Master	S	M-code	NACK	Sr	SAD + W		RA	
Slave						ACK		ACK

Speed	HS-mode							FS-mode
Master	Sr	SAD + R					NACK	P
Slave			ACK	DATA	ACK	DATA		

(n-1) bytes +
ack.

Register Descriptions

Accelerometer Outputs

These registers contain up to 14-bits of valid acceleration data for each. The data is updated every user-defined ODR period, is protected from overwrite during each read, and can be converted from digital counts to acceleration (g) per Table 11 below. The register acceleration output binary data is represented in 2's complement format. For example, if N = 14 bits, then the Counts range is from -8192 to 8191, if N = 12 bits, then the Counts range is from -2048 to 2047, and if N = 8 bits, then the Counts range is from -128 to 127.

14-bit Register Data (2's complement)	Equivalent Counts in decimal	Range = ±2g	Range = ±4g	Range = ±8g	Range = ±16g
00011111111111	8191	Not available	Not available	+7.999g	+15.998g

Interrupt Source Registers

These two registers report interrupt state changes. This data is updated when a new interrupt event occurs and each application's result is latched until the interrupt release register is read. The programmable interrupt engine can be configured to report data in an unlatched manner via the interrupt control registers.

INT_SOURCE1

This register reports which function caused an interrupt. Reading from the interrupt release register (INT_REL, 0x1Ah) will clear the entire contents of this register.

R	R	R	R	R	R	R	R
0	0	0	DRDY	0	0	WUFS	0
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I ² C Address: 0x16h							

DRDY - indicates that new acceleration data (at Reg Addr 0x06h to 0x0Bh) is available. This bit is cleared when acceleration data is read or the interrupt release register (INT_REL, 0x1Ah) is read.

- 0 = New acceleration data not available
- 1 = New acceleration data available

WUFS - Wake up has occurred. This bit is cleared when the interrupt source latch register (INT_REL, 0x1Ah) is read.

- 0 = No motion
- 1 = Motion has activated the interrupt

INT_SOURCE2

This register reports the axis and direction of detected motion per Table 12. This register is cleared when the interrupt source latch register (INT_REL, 0x1Ah) is read.

CTRL_REG1

Read/write control register that controls the main feature set.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
PC1	RES	DRDYE	GSEL1	GSEL0	EN16G	WUFE	0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
I ² C Address: 0x1Bh								

PC1 controls the operating mode of the KXTJ3.

- 0 = stand-by mode
- 1 = operating mode

RES determines the performance mode of the KXTJ3. Note that to change the value of this bit, the PC1 bit must first be set to “0”.

- 0 = Low current, 8-bit valid. Only available for ODR ≤ 200 Hz. Bandwidth (Hz) = 800
- 1 = High Resolution, 12-bit or 14-bit valid. Bandwidth (Hz) = ODR/2

DRDYE enables the reporting of the availability of new acceleration data as an interrupt. Note that to change the value of this bit, the PC1 bit must first be set to “0”.

- 0 = availability of new acceleration data is not reflected as an interrupt
- 1 = availability of new acceleration data is reflected as an interrupt

GSEL1, GSEL0, EN16G selects the acceleration range of the accelerometer outputs per Table 13. Note that to change the value of this bit, the PC1 bit must first be set to “0”.

GSEL1	GSEL0	EN16G	Range
0	0	0	±2g
0	1	0	±4g
1	0	0	±8g
1	1	0	±8g ¹
0	0	1	±16g
0	1	1	±16g
1	0	1	±16g
1	1	1	±16g ¹

Table 13. Selected Acceleration Range

WUFE enables the Wake Up (motion detect) function. 0= disabled, 1= enabled. Note that to change the value of this bit, the PC1 bit must first be set to “0”.

- 0 = Wake Up function disabled
- 1 = Wake Up function enabled

¹ This is a 14-bit mode available only in High Resolution mode and only for Registers 0x06h-0x0Bh

	± 2g / 4g / 8g / 16g Tri-axis Digital Accelerometer Specifications	PART NUMBER: KXTJ3-1057 Rev. 2.0 10-Nov-16
---	---	---

CTRL_REG2

Read/write control register that provides more feature set control. Note that to properly change the value of this register, the PC1 bit in CTRL_REG1 must first be set to “0”.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
SRST	Reserved	Reserved	DCST	Reserved	OWUFA	OWUFB	OWUFC	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
I ² C Address: 0x1Dh								

SRST initiates software reset, which performs the RAM reboot routine. This bit will remain 1 until the RAM reboot routine is finished.

SRST = 0 – no action

SRST = 1 – start RAM reboot routine

Reserved

Care must be taken to not overwrite Reset Value of reserved bit(s)

DCST initiates the digital communication self-test function.

DCST = 0 – no action

DCST = 1 – sets DCST_RESP register to 0xAAh and when DCST_RESP is read, sets this bit to 0 and sets DCST_RESP to 0x55h

OWUFA, OWUFB, OWUFC sets the Output Data Rate for the Wake Up function (motion detection) per Table 14 below

OWUFA	OWUFB	OWUFC	Wake Up function Output Data Rate
0	0	0	0.781Hz
0	0	1	1.563Hz
0	1	0	3.125Hz
0	1	1	6.25Hz
1	0	0	12.5Hz
1	0	1	25Hz
1	1	0	50Hz
1	1	1	100Hz

Table 14. Output Data Rate for Wake Up Function

INT_CTRL_REG1

This register controls the settings for the physical interrupt pin (7). Note that to properly change the value of this register, the PC1 bit in CTRL_REG1 must first be set to “0”.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
0	0	IEN	IEA	IEL	0	STPOL	0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00010000
I ² C Address: 0x1Eh								

IEN enables/disables the physical interrupt pin (7)

IEN = 0 – physical interrupt pin (7) is disabled

IEN = 1 – physical interrupt pin (7) is enabled

IEA sets the polarity of the physical interrupt pin (7)

IEA = 0 – polarity of the physical interrupt pin (7) is active low

IEA = 1 – polarity of the physical interrupt pin (7) is active high

IEL sets the response of the physical interrupt pin (7)

IEL = 0 – the physical interrupt pin (7) latches until it is cleared by reading INT_REL

IEL = 1 – the physical interrupt pin (7) will transmit one pulse with a period of 0.03 - 0.05ms

STPOL – Self-test polarity.

0=negative polarity (unsupported) 1=positive polarity (supported)

INT_CTRL_REG2

This register controls which axis and direction of detected motion can cause an interrupt. Note that to properly change the value of this register, the PC1 bit in CTRL_REG1 must first be set to “0”.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

WAKEUP_COUNTER

This register sets the time motion must be present before a wake-up interrupt is set. Every count is calculated as 1/OWUF delay period. Note that to properly change the value of this register, the PC1 bit in CTRL_REG1 must first be set to “0”. Valid entries are from 1 to 255, excluding the zero value.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

I ² C Address: 0x29h								

NA_COUNTER

This register sets the non-activity time required before another wake-up interrupt can be set. Every count is calculated as 1/OWUF delay period. Note that to properly change the value of this register, the PC1 bit in CTRL_REG1 must first be set to “0”. Valid entries are from 1 to 255, excluding the zero value.

I ² C Address: 0x2Ah								

SELF_TEST

When 0xCA is written to this register, the MEMS self-test function is enabled. Electrostatic-actuation of the accelerometer, results in a DC shift of the X, Y and Z axis outputs. Writing 0x00 to this register will return the accelerometer to normal operation.

WAKEUP_THRESHOLD

This register sets the threshold for wake-up (motion detect) interrupt is set. Data bytes are WAKEUP_THRESHOLD_H, WAKEUP_THRESHOLD_L. The KXTJ3 will be shipped from the factory with this value set to correspond to a change in acceleration of 0.5g (3.9mg/count). Note that to properly change the value of this register, the PC1 bit in CTRL_REG1 must first be set to “0”.

Embedded Wake Up Function

The motion interrupt feature of the KXTJ3 reports qualified changes in the high-pass filtered acceleration based on the WAKEUP_THRESHOLD. If the high-pass filtered acceleration on any axis is greater than the user-defined WAKEUP_THRESHOLD, the device has transitioned from an inactive state to an active state. Equation 1 and Equation 2 show how to calculate the engine threshold (WAKEUP_THRESHOLD) and delay time (WAKEUP_COUNTER) register values for the desired result.

$$WAKEUP_THRESHOLD \text{ (counts)} = \text{Desired Threshold (g)} \times 256 \text{ (counts/g)}$$

Equation 1: Wake Up Threshold

An 8-bit raw unsigned value represents a counter that permits the user to qualify each active/inactive state change. Note that each WAKEUP_COUNTER count qualifies 1 (one) user-defined ODR period (OWUF). Equation 2 shows how to calculate the WAKEUP_COUNTER register value for a desired wake up delay time.

$$WAKEUP_COUNTER \text{ (counts)} = \text{Desired Delay Time (sec)} \times OWUF \text{ (Hz)}$$

Equation 2: Wake Up Delay Time

The latched motion interrupt response algorithm works as following: while the part is in inactive state, the algorithm evaluates differential measurement between each new acceleration data point with the preceding one and evaluates it against the WAKEUP_THRESHOLD threshold. When the differential measurement is greater than WAKEUP_THRESHOLD threshold, the wakeup counter starts the count. Differential measurements are now calculated based on the difference between the current acceleration and the acceleration when the counter started. The part will report that motion has occurred at the end of the count assuming each differential measurement has remained above the threshold. If at any moment during the count the differential measurement falls below the threshold, the counter will stop the count and the part will remain in inactive state.

To illustrate how the algorithm works, consider the Figure 3 below that shows the latched response of the motion detection algorithm with WAKEUP_COUNTER set to 10 counts. Note how the difference between the acceleration sample marked in red and the one marked in green resulted in a differential measurements represented with orange bar being above the WAKEUP_THRESHOLD. At this point, the counter begins to count number of counts stored in WAKEUP_COUNTER register and the wakeup algorithm will evaluate the difference between each new acceleration measurement and the measurement marked in green that will remain a reference measurement for the duration of the counter count. At the end of the count, assuming all differential measurements were larger than WAKEUP_THRESHOLD, as is the case in the example showed in Figure 3, a motion event will be reported.

± 2g / 4g / 8g / 16g Tri-axis Digital Accelerometer Specifications

PART NUMBER:
KXTJ3-1057
Rev. 2.0
10-Nov-16

Figure 3 below shows the latched response of the Wake Up Function with WUF counter = 10 counts.

Figure 3. Latched Motion Interrupt Response

The KXTJ3 wake-up function is always latched unless $ULMODE = 1$. If $ULMODE = 0$ and if the INT_CTRL_REG1 is set with $IEL = 1$, then upon a wake-up event the WUF interrupt signal will pulse and return low, but only once. The WUF interrupt output will not reset until a read of the INT_REL latch reset register.

Notice

Precaution on using KIONIX Products

- Our Products are designed and manufactured for application in ordinary electronic equipment (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment (Note 1), transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property (“Specific Applications”), please consult with the KIONIX sales representative in advance. Unless otherwise agreed in writing by KIONIX in advance, KIONIX shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any KIONIX’s Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASS III	CLASS III	CLASS II b	CLASS III
CLASS IV		CLASS III	

- KIONIX designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
 - Installation of protection circuits or other protective devices to improve system safety
 - Installation of redundant circuits to reduce the impact of single or multiple circuit failure
- Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, KIONIX shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any KIONIX’s Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc., prior to use, must be necessary:
 - Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
 - Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
 - Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
 - Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
 - Sealing or coating our Products with resin or other coating materials
 - Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
 - Use of the Products in places subject to dew condensation
- The Products are not subject to radiation-proof design.
- Please verify and confirm characteristics of the final or mounted products in using the Products.
- In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.

	± 2g / 4g / 8g / 16g Tri-axis Digital Accelerometer Specifications	PART NUMBER: KXTJ3-1057 Rev. 2.0 10-Nov-16
---	---	---

7. De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.
8. Confirm that operation temperature is within the specified range described in the product specification.
9. KIONIX shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
2. In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the KIONIX representative in advance.

For details, please refer to KIONIX Mounting specification.

Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. KIONIX shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
 - a) the Products are exposed to sea winds or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - b) the temperature or humidity exceeds those recommended by KIONIX
 - c) the Products are exposed to direct sunshine or condensation
 - d) the Products are exposed to high Electrostatic
2. Even under KIONIX recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

	<p align="center">± 2g / 4g / 8g / 16g Tri-axis Digital Accelerometer Specifications</p>	<p>PART NUMBER: KXTJ3-1057 Rev. 2.0 10-Nov-16</p>

Precaution for Product Label

A two-dimensional barcode printed on KIONIX Products label is for KIONIX's internal use only.

Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act

Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with KIONIX in case of export.

Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. KIONIX does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.
2. KIONIX shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).
3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of KIONIX or any third parties with respect to the Products or the information contained in this document. Provided, however, that KIONIX will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of KIONIX.
2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of KIONIX.
3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
4. The proper names of companies or products described in this document are trademarks or registered trademarks of KIONIX, its affiliated companies or third parties.
