Series-Connected SuperCapacitor Modules

This new series of electrochemical, double-layer, series-connected SuperCapacitor modules offers excellent pulse power handling characteristics based on the combination of very high capacitance and very low ESR. Used by themselves or in conjunction with primary or secondary batteries, they provide extended back up time, longer battery life, and provide instantaneous power pulses as needed. Offers great solutions to Hold Up, Energy Harvesting, and Pulse Power Applications.

FEATURES

- · Low ESR provides high efficiency and high power density
- Withstands high vibrations and high current applications
- Life time capable of millions of cycles
- Active cell balancing

APPLICATIONS

- · Heavy industrial equipment
- Grid storage
- UPS/Industrial systems
- · Regenerative energy capture
- · Pitch control

HOW TO ORDER

Balancing B = Active Balanced

В

QUALITY INSPECTION

Parts are tested for life cycle, high temperature load life, temperature characteristics, vibration resistance, and humidity characteristics. See page 2 for more information.

TERMINATION

Power terminals are M8 (+) and M10 (-). Recommended torque is 20 Nm (M8) and 30 Nm (M10). See pages 4 and 6 for more information on pin out and polarity.

OPERATING TEMPERATURE

-40°C to +65°C @ 16V

For RoHScompliant products, please select correct termination style

Pin Out Designation

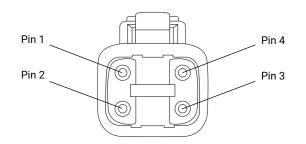

51±0.25-

Pin	Color	Designation		
1	Yellow	Ground		
2	Blue	Overvoltage		
3	Brown	Not used		
4	White	Temperature		

Note: Pin 2, the overvoltage signal, is an open collector transistor that pulls the pin low if any cell experiences an overvoltage condition. Pin 4, the temperature signal, has a 10K NTC device connected between it and the ground pin. The module temperature can be determined by reading the resistance of the NTC. See table below for resistance values at select intermediate temperatures.

TEST METHODS

IEC CAPACITANCE TEST METHOD

Procedure:

Charge module under constant current to rated voltage at room temperature, then hold 10 minutes on charge under constant voltage. After 10 minutes, discharge under constant current (as shown in chart below), recording voltage at V1, V2, and time intervals at t1 and t2. Use the capacitance formula to determine cap value.

- I Discharge Current, 4 × C × V_R (mA)
- V_p Rated Voltage (V)
- V₁ Initial Test Voltage, 80% Of V_p (V)
- V₂ Final Test Voltage, 40% Of V_R (V)
- t₁ Initial Test Time (s)
- T₂ Final Test Time (s)

$$C = \frac{1 \times (t_2 - t_1)}{V1 - V2}$$

DC ESR MEASUREMENT

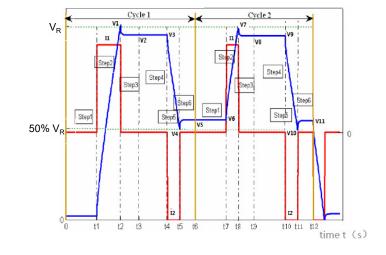

A six-step $\mathsf{ESR}_{\mathsf{DC}}$ test method is illustrated to the right and carried out as follows:

- Rest 10 Seconds
- Charge under constant current (I₁) to rated voltage (V_P)
- Rest 5 seconds
- Rest 10 seconds, record V₃ and t₄
- Discharge under constant current (I2) to half rated voltage, Record I₂, V₄, And t₅
- Rest 5 seconds, record V₅ And t₆

Repeat steps 1-6 recording I, V, And t accordingly, finally discharging to below 0.1V under constant current (I₂).

Formulas to calculate:

- Two cycle discharge capacitances: $C_{dch1} = I_2 \times \frac{(t_5 t_4)}{V_3 V_4}$; $C_{dch2} = I_2 \times \frac{(t_{11} t_{10})}{(V_9 V_{10})}$
- Discharge capacitance: $C_{dch} = \frac{(C_{dch1} + C_{dch2})}{2}$
- Two cycle discharge DC ESR: $ESR_{dch1} = \frac{(V_5 V_4)}{I_2}$; $ESR_{dch2} = \frac{(V_{11} V_{10})}{I_2}$ Discharge DC ESR: $ESR_{dch} = \frac{(ESR_{dch1} + ESR_{dch2})}{2}$

Note: I₁ = I₂ = 75mA/F, the rated capacitance in the chart means discharge capacitance, and DC ESR (ESR_{DC}) means discharge DC resistance.

Series-Connected SuperCapacitor Modules

TEST METHODS (continued)

MAXIMUM CONTINUOUS CURRENT

· This is the maximum current when temperature rise of the supercapacitor during its operation is less than 15°C

MAXIMUM PEAK CURRENT

· This is the maximum current during 1 second time interval (dt)

WATT DENSITY

• Watt Density = $(0.12*V^2 / R_{pc})$ / mass

ENERGY DENSITY

Energy Density = (½ CV²) / (3600*mass)

POLARITY AND REVERSE VOLTAGE

For product consistency and optimum performance, it is recommended that the capacitor be connected with polarity indicated. Reversing polarity could result in permanent damage to the circuit including much higher leakage current for a short duration of time and the life time of the supercapacitors will be reduced.

LIFE TIME AND TEMPERATURE PERFORMANCE

The life of a supercapacitor is impacted by a combination of operating voltage and the operating temperature according to the following Time to Failure equation:

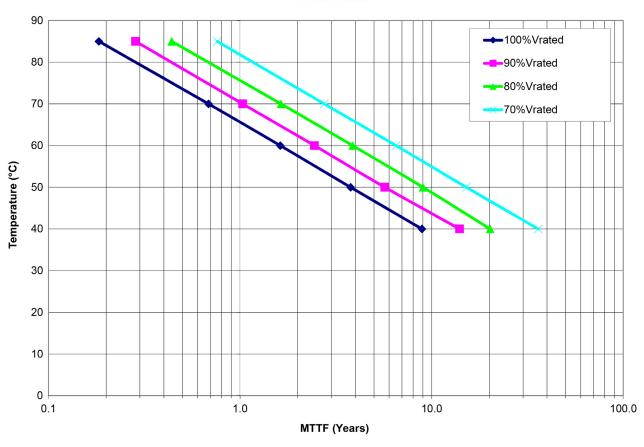

$$t \propto V^n \times e^{\left(\frac{-Q}{kT}\right)}$$

where V is the operating voltage, Q is the activation energy in electron volts (eV), k is the Boltzmann constant in eV, and T is the operating temperature in Kelvin (K). Typical values for the voltage exponent, n, is between 2.5-3.5, and Q is between 1.0-1.2 eV in the normal operating temperature range of -40° to 65°C.

The industry standard for supercapacitor end of life is when the equivalent series resistance, ESR, increases to 200% of the specified value and the capacitance drops by 30% from specified value. Typically a supercapacitor shows an initial "jump" in the ESR value and then levels off. If the supercapacitors are exposed to excessive temperatures the ESR will show a continuous degradation (increase). In the extreme case, if the temperature or voltage are substantially higher than the rated specifications, this could result in the part venting and the product showing a faster degradation of capacitance and ESR, which may be many times the specified value.

Expected Lifetime at Various Voltages SCM Series

SAFETY RECOMMENDATIONS

WARNINGS

- To Avoid Short Circuit, after usage or test, Super Capacitor voltage needs to discharge to ≤ 0.1V
- Do not Apply Overvoltage, Reverse Charge, Burn or Heat Higher than 150°C, explosion-proof valve may break open
- Do not Press, Damage or disassemble the Super Capacitor, housing could heat to high temperature causing Burns
- If you observe Overheating or Burning Smell from the capacitor disconnect Power immediately, and do not touch

EMERGENCY APPLICATIONS

- · If Housing is Leaking:
- Skin Contact: Use soap and water thoroughly to wash the area of the skin
- Eye Contact: Flush with flowing water or saline, and immediately seek medical treatment
- · Ingestion: Immediately wash with water and seek medical treatment

TRANSPORTATION

Not subjected to US DOT or IATA regulations UN3499, <10Wh, Non-Hazardous Goods International shipping description – "Electronic Products – Capacitor"

Licenced by CAP-XX

REGULATORY

- UL 810A
- · RoHS Compliant
- · REACH Compliant

STORAGE

Capacitors may be stored within the temperature range of -40°C to +70°C with humidity < 60%. Lower storage temperature is preferred as it extends the shelf life of the capacitor. Product over one year and within two years of the date code, we recommend recharging the product at the beginning of use for at least 24 hours.

Optimum storage conditions are as follows:

- 25°C and RH ≤ 60% without voltage applied
- · Not in direct sunlight
- · Not in direct contact with water, salt oil or other chemicals
- Not in direct contact with corrosive materials, acids, alkalis, or toxic gases
- · Not in dusty environments
- · Not in environments with shock and vibration conditions
