## Features

- SuperFAST HIGH DENSITY IN-SYSTEM PROGRAMMABLE LOGIC
- 8000 PLD Gates
- 96 I/O Pins, Nine or Twelve Dedicated Inputs
- 192 Registers
- High Speed Global Interconnect
- Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
- Small Logic Block Size for Random Logic
- Pinout Compatible with ispLSI 2096V and 2096VE
- 3.3V LOW VOLTAGE ARCHITECTURE
- Interfaces with Standard 5V TTL Devices
- HIGH PERFORMANCE E²CMOS ${ }^{\circledR}$ TECHNOLOGY
- $\mathbf{f m a x}^{\mathbf{m}} \mathbf{2 2 5 M H z}$ Maximum Operating Frequency
- tpd = 4.0ns Propagation Delay
- Electrically Erasable and Reprogrammable
- Non-Volatile
- 100\% Tested at Time of Manufacture
- Unused Product Term Shutdown Saves Power
- IN-SYSTEM PROGRAMMABLE
- 3.3V In-System Programmability (ISP ${ }^{\text {TM }}$ ) Using Boundary Scan Test Access Port (TAP)
- Open-Drain Output Option for Flexible Bus Interface Capability, Allowing Easy Implementation of WiredOR Bus Arbitration Logic
- Increased Manufacturing Yields, Reduced Time-toMarket and Improved Product Quality
- Reprogram Soldered Devices for Faster Prototyping
- 100\% IEEE 1149.1 BOUNDARY SCAN TESTABLE
- THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FPGAS
- Enhanced Pin Locking Capability
- Three Dedicated Clock Input Pins
- Synchronous and Asynchronous Clocks
- Programmable Output Slew Rate Control
- Flexible Pin Placement
- Optimized Global Routing Pool Provides Global Interconnectivity
- LEAD-FREE PACKAGE OPTIONS
ispLSI 2192VE

### 3.3V In-System Programmable

 SuperFAST ${ }^{\text {TM }}$ High Density PLD
## Functional Block Diagram

## Description

The ispLSI 2192VE is a High Density Programmable Logic Device containing 192 Registers, nine or twelve Dedicated Input pins, three Dedicated Clock Input pins, two dedicated Global OE input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 2192VE features in-system programmability through the Boundary Scan Test Access Port (TAP) and is $100 \%$ IEEE 1149.1 Boundary Scan Testable. The ispLSI 2192VE offers non-volatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems.
The basic unit of logic on the ispLSI 2192VE device is the Generic Logic Block (GLB). The GLBs are labeled A0, A1 .. F7 (see Figure 1). There are a total of 48 GLBs in the ispLSI 2192VE device. Each GLB is made up of four macrocells. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

## Functional Block Diagram

Figure 1. ispLSI 2192VE Functional Block Diagram

The 2192VE contains 96 I/O cells. Each I/O cell is directly connected to an I/O pin and can be individually programmed to be a combinatorial input, output or bi-directional I/O pin with 3 -state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA . Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise. Device pins can be safely driven to 5 V signal levels to support mixed-voltage systems.

Eight GLBs, 16 I/O cells, two dedicated inputs and an ORP are connected together to make a Megablock (see Figure 1). The outputs of the eight GLBs are connected to a set of 16 universal I/O cells by the ORP. Each ispLSI 2192VE device contains six Megablocks.

The GRP has as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI 2192VE device are selected using the dedicated clock pins. Three dedicated clock pins (YO, Y1, Y2) or an asynchronous clock can be selected on a GLB basis. The asynchronous or Product Term clock can be generated in any GLB for its own clock.

## Programmable Open-Drain Outputs

In addition to the standard output configuration, the outputs of the ispLSI 2192VE are individually programmable, either as a standard totem-pole output or an open-drain output. The totem-pole output drives the specified Voh and Vol levels, whereas the open-drain output drives only the specified Vol. The Voh level on the open-drain output depends on the external loading and pull-up. This output configuration is controlled by a programmable fuse. The default configuration when the device is in bulk erased state is totem-pole configuration. The open-drain/totem-pole option is selectable through the Lattice software tools.

Specifications ispLSI 2192VE
Absolute Maximum Ratings ${ }^{1}$

1. Stresses above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

## DC Recommended Operating Condition

| SYMBOL | PARAMETER | MIN. | MAX. | UNITS |  |
| :--- | :--- | :--- | :---: | :---: | :---: |
| VCC | Supply Voltage | Commercial $\quad \mathrm{T}_{\mathrm{A}}=0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ | 3.0 | 3.6 | V |
| VIL | Input Low Voltage | $\mathrm{V}_{\text {SS }}-0.5$ | 0.8 | V |  |
| VIH | Input High Voltage | 2.0 | 5.25 | V |  |

## Capacitance $\left(\mathrm{T}_{A}=25^{\circ} \mathrm{C}, \mathrm{f}=1.0 \mathrm{MHz}\right.$ )

| SYMBOL | PARAMETER | TYPICAL | UNITS | TEST CONDITIONS |
| :--- | :--- | :---: | :---: | :---: |
| $\mathbf{C}_{1}$ | Dedicated Input Capacitance | 8 | pf | $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}, \mathrm{~V}_{\text {IN }}=0.0 \mathrm{~V}$ |
| $\mathbf{C}_{2}$ | I/O Capacitance | 8 | pf | $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{I} / \mathrm{O}}=0.0 \mathrm{~V}$ |
| $\mathbf{C}_{3}$ | Clock and Global Output Enable Capacitance | 12 | pf | $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{Y}}=0.0 \mathrm{~V}$ |

## Erase Reprogram Specifications

| PARAMETER | MINIMUM | MAXIMUM | UNITS |
| :--- | :---: | :---: | :---: |
| Erase/Reprogram Cycles | 10,000 | - | Cycles |

## Switching Test Conditions

| Input Pulse Levels | GND to 3.0 V |
| :--- | :---: |
| Input Rise and Fall Time | $\leq 1.5 \mathrm{~ns} 10 \%$ to $90 \%$ |
| Input Timing Reference Levels | 1.5 V |
| Output Timing Reference Levels | 1.5 V |
| Output Load | See Figure 2 |

3-state levels are measured 0.5V from steady-state active level.
Table 2-0003/2192VE

## Output Load Conditions (see Figure 2)

| TEST CONDITION |  | R1 | R2 | CL |
| :---: | :--- | :---: | :---: | :---: |

## Power Consumption

Power consumption in the ispLSI 2192VE device de- used. Figure 3 shows the relationship between power pends on two primary factors: the speed at which the device is operating and the number of Product Terms and operating speed.

Figure 3. Typical Device Power Consumption vs fmax

ICC can be estimated for the ispLSI 2192VE using the following equation:
ICC $=25+(\#$ of PTs * 0.670) + (\# of nets * max freq * 0.0051)
Where:
\# of PTs = Number of Product Terms used in design
\# of nets = Number of Signals used in device
Max freq = Highest Clock Frequency to the device (in MHz)
The ICC estimate is based on typical conditions ( $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}$, room temperature) and an assumption of two GLB loads on average exists. These values are for estimates only. Since the value of ICC is sensitive to operating conditions and the program in the device, the actual ICC should be verified.

## Signal Descriptions

| Signal Name | Description |
| :--- | :--- |
| $\overline{\text { RESET }}$ | Active Low (0) Reset pin resets all the registers in the device. |
| GOE 0, GOE1 | Global Output Enable input pins. |
| Y0, Y1, Y2 | Dedicated Clock Input - These clock inputs are connected to one of the clock inputs of all the GLBs in <br> the device. |
| $\overline{\text { BSCAN }}$ | Input - Dedicated in-system programming Boundary Scan enable input pin. This pin is brought low to <br> enable the programming mode. The TMS, TDI, TDO and TCK controls become active. |
| TDI/IN 0 | Input - This pin performs two functions. When $\overline{\text { BSCAN is logic low, it functions as a serial data input pin }}$ <br> to load programming data into the device. When $\overline{\text { SSCAN is high, it functions as a dedicated input pin. }}$ |
| TCK/IN 7 | Input - This pin performs two functions. When $\overline{\text { BSCAN }}$ is logic low, it functions as a clock pin for the <br> Boundary Scan state machine. When $\overline{\text { BSCAN is high, it functions as a dedicated input pin. }}$ |
| TMS/IN 1 | Input - This pin performs two functions. When $\overline{\text { BSCAN is logic low, it functions as a mode control pin for }}$ <br> the Boundary Scan state machine. When $\overline{\text { BSCAN is high, it functions as a dedicated input pin. }}$ |
| TDO/IN 6 | Output/Input - This pin performs two functions. When $\overline{\text { BSCAN is logic low, it functions as an output pin }}$ <br> to read serial shift register data. When $\overline{\text { BSCAN is high, it functions as a dedicated input pin. }}$ |
| IN 2-5, IN 8-11 | Dedicated Input Pins to the device. |
| GND | Ground (GND) |
| VCC | Vcc |
| NC ${ }^{1}$ | No Connect |
| I/O | Input/Output Pins - These are the general purpose I/O pins used by the logic array. |

1. NC pins are not to be connected to any active signals, VCC or GND.

## Signal Locations

| Signal Name | 128-Pin TQFP | 144-Ball fpBGA |
| :--- | :--- | :--- |
| RESET | 15 | G4 |
| GOE 0, GOE 1 | 80,17 | F12, G2 |
| Y0, Y1, Y2 | $14,83,78$ | F3, F10, G11 |
| BSCAN | 19 | F1 |
| TDI/IN 0 | 20 | G3 |
| TMS/IN 1 | 48 | J6 |
| TDO/IN 6 | 112 | C7 |
| TCK/IN 7 | 77 | G12 |
| IN 2-5, IN 8-11 | $-, 49,82,-, 84,113,13,-$ | M7, J7, F9, G10, E12, B6, <br> F2, E1 |
