## Description

The LZC-series 12-die White LED emitter has an electrical input power dissipation capability of more than 40 Watt electrical power in an extremely small package. With a small $9.0 \mathrm{~mm} \times 9.0 \mathrm{~mm}$ ultra-small footprint, this package provides exceptional luminous flux density. The high quality materials used in the package are chosen to minimize stresses and optimize light output which results in superior reliability and lumen maintenance. The robust product design thrives in outdoor applications with high ambient temperatures and high humidity.

Notes for Table 3:

1. Maximum DC forward current (per die) is determined by the overall thermal resistance and ambient temperature.

Follow the curves in Figure 10 for current derating.
2: Pulse forward current conditions: Pulse Width $\leq 10 \mathrm{msec}$ and Duty cycle $\leq 10 \%$.
3. LEDs are not designed to be reverse biased.
4. Solder conditions per JEDEC O20D. See Reflow Soldering Profile Figure 5.
5. LED Engin recommends taking reasonable precautions towards possible ESD damages and handling the LZC-OOWWOR in an electrostatic protected area (EPA). An EPA may be adequately protected by ESD controls as outlined in ANSI/ESD S6.1.

## Average Lumen Maintenance Projections

Lumen maintenance generally describes the ability of a lamp to retain its output over time. The useful lifetime for solid state lighting devices (Power LEDs) is also defined as Lumen Maintenance, with the percentage of the original light output remaining at a defined time period.

Based on long-term LM80 testing, LED Engin projects that the LZC Series will deliver, on average, $70 \%$ Lumen Maintenance at 70,000 hours of operation at a forward current of 700 mA per die. This projection is based on constant current operation with junction temperature maintained at or below $110^{\circ} \mathrm{C}$.

## Mechanical Dimensions (mm)

Notes for Figure 1:

1. LZC-OOWWOR is compatible with MCPCB designed for LZC-OOWWOO, LZC-OONWOO, and LZC-00CWOO when emitter is rotated 180 degree with respect to the LZC-00xWOO position on the MCPCB.
2. Index mark, Tc indicates case temperature measurement point.
3. Unless otherwise noted, the tolerance $= \pm 0.20 \mathrm{~mm}$.
4. Thermal contact pad is electrically neutral.

## Mechanical Mounting of MCPCB

- MCPCB bending should be avoided as it will cause mechanical stress on the emitter, which could lead to substrate cracking and subsequently LED dies cracking.
- To avoid MCPCB bending:
- Special attention needs to be paid to the flatness of the heat sink surface and the torque on the screws.
- Care must be taken when securing the board to the heat sink. This can be done by tightening three M3 screws (or \#4-40) in steps and not all the way through at once. Using fewer than three screws will increase the likelihood of board bending.
- It is recommended to always use plastics washers in combinations with the three screws.
- If non-taped holes are used with self-tapping screws, it is advised to back out the screws slightly after tightening (with controlled torque) and then re-tighten the screws again.

## Thermal interface material

- To properly transfer heat from LED emitter to heat sink, a thermally conductive material is required when mounting the MCPCB on to the heat sink.
- There are several varieties of such material: thermal paste, thermal pads, phase change materials and thermal epoxies. An example of such material is Electrolube EHTC.
- It is critical to verify the material's thermal resistance to be sufficient for the selected emitter and its operating conditions.

## Wire soldering

- To ease soldering wire to MCPCB process, it is advised to preheat the MCPCB on a hot plate of $125-150^{\circ} \mathrm{C}$. Subsequently, apply the solder and additional heat from the solder iron will initiate a good solder reflow. It is recommended to use a solder iron of more than 60W.
- It is advised to use lead-free, no-clean solder. For example: SN-96.5 AG-3.0 CU 0.5 \#58/275 from Kester (pn: 24-7068-7601)
