User´s Guide

Wireless made simple®

Warning: Some customers may want Linx radio frequency ("RF") products to control machinery or devices remotely, including machinery or devices that can cause death, bodily injuries, and/or property damage if improperly or inadvertently triggered, particularly in industrial settings or other applications implicating life-safety concerns ("Life and Property Safety Situations").

NO OEM LINX REMOTE CONTROL OR FUNCTION MODULE SHOULD EVER BE USED IN LIFE AND PROPERTY SAFETY SITUATIONS. No OEM Linx Remote Control or Function Module should be modified for Life and Property Safety Situations. Such modification cannot provide sufficient safety and will void the product's regulatory certification and warranty.

Customers may use our (non-Function) Modules, Antenna and Connectors as part of other systems in Life Safety Situations, but only with necessary and industry appropriate redundancies and in compliance with applicable safety standards, including without limitation, ANSI and NFPA standards. It is solely the responsibility of any Linx customer who uses one or more of these products to incorporate appropriate redundancies and safety standards for the Life and Property Safety Situation application.

Do not use this or any Linx product to trigger an action directly from the data line or RSSI lines without a protocol or encoder/decoder to validate the data. Without validation, any signal from another unrelated transmitter in the environment received by the module could inadvertently trigger the action.

All RF products are susceptible to RF interference that can prevent communication. RF products without frequency agility or hopping implemented are more subject to interference. This module does not have a frequency hopping protocol built in.

Do not use any Linx product over the limits in this data guide. Excessive voltage or extended operation at the maximum voltage could cause product failure. Exceeding the reflow temperature profile could cause product failure which is not immediately evident.

Do not make any physical or electrical modifications to any Linx product. This will void the warranty and regulatory and UL certifications and may cause product failure which is not immediately evident.

Ordering Information

1. Battery – 3VDC (use a CR2032-style battery only)
2. Power Switch
3. Power On Indicator LED
4. Momentary Pushbuttons
5. Prototyping Area
6. Breakout Header
7. Reverse-Polarity SMA Antenna Connector
8. LR Series Transmitter Module
9. DS Series Encoder / Decoder
10. Protocol Select Switch
11. Holtek Protocol Configuration Switches
12. Address Configuration DIP Switch

Theory of Operation

Encoder Evaluation Board

The transmitter board is powered by an on-board 3V CR2032 lithium battery. It has eight SPST pushbutton switches, the states of which are encoded into a data stream using the DS Series as an encoder. If a switch is closed, the transmitter is enabled while the encoder captures the pushbutton states for encoding and transmission. Buttons S0 (D0) is used to activate a buzzer on the receiver board while the rest of the buttons activate LEDs. All of the data lines are wired out to the header to the right of the prototyping area and can be accessed for use with other switches, contacts or microcontrollers.

Decoder Evaluation Board

The receiver board is powered by two AAA batteries. The data recovered by the LR Series receiver is decoded using the DS Series as a decoder, and the data line outputs are updated to match the states of the data line inputs (or pushbuttons) on the transmitter board. To demonstrate this, one data line is used to activate a buzzer while the other seven are used to drive LEDs. This board also has a prototyping area with all of the receiver and decoder lines brought out to a header.

Using the Kit

Using the kit is straightforward. Simply attach the antennas, turn on the power, and press buttons on the transmitter board. When S0 is pressed, the buzzer sounds; when S1–S7 are pressed, the LEDs turn on. When any button (S0–S7) is pressed on the transmitter board, the corresponding decoder output (D0–D7) is active high (V_{CC}) on the prototyping header.

> Note: All switches (address, protocol select and Holtek configuration) must match on both the encoder and decoder boards.

Selecting the Protocol

The DS Series encoder / decoder offers two over-the-air protocols. The Holtek selection is used when communicating with other Holtek devices. The serial selection offers a much more reliable protocol to allow better range and response time. See the DS Series Data Guide for more details.

Development Using the Prototyping Area

In addition to their evaluation functions, the boards may also be used for product development. They feature a prototyping area to facilitate the addition of application-specific circuitry. This area has a connection to V_{CC} at the top and ground at the bottom that can be used to power any circuitry that is added.

> Note: The CR2032-style battery on the transmitter board has very low current capacity with, only about 3mA available for external circuitry. If added circuitry requires a higher current, the battery must be removed and the board powered from an external source.

The holes are plated and set at 0.1" on center with a 0.04" diameter, making it easy to add most industry-standard SIP and DIP packages to the board.

On the encoder board, the Transmit Enable (TE), Data Output (DOUT) and data lines (D0–D7) from the encoder have been wired out to a row of plated holes on the right side of the prototyping area. On the receiver board, the Data In (DIN), the Valid Transmission (VT) and the data lines (D0–D7) from the decoder have been wired out. This allows easy access to connect external circuitry to the encoder and decoder. Data line D0 is connected to the buzzer; D1–D7 and VT are connected to LEDs.

Range Testing

Several complex mathematical models exist for determining path loss in many environments. These models vary as the transmitter and receiver are moved from indoor operation to outdoor operation. Although these models can provide an estimation of range performance in the field, the most reliable method is to simply perform range tests using the transmitter and receiver in the intended operational environment.

Basic range testing can be performed with the transmitter and receiver evaluation boards. To prepare the board for range testing, turn it on by switching the power switch to the ON position. Pressing S0 on the transmitter activates the buzzer on the receiver board. For continuous transmit, connect D0 to V_{CC}. This allows the designer to turn on the transmitter and walk with the receiver.

As the maximum range of the link in an area is approached, it is not uncommon for the signal to cut in and out as the transmitter moves. This

Using the Boards as a Design Reference

The basic evaluation boards included in this kit are very simple, yet they illustrate some important techniques that should be incorporated into the board layout. The module's mounting pads extend slightly past the edge of the part. This eases hand assembly and allows for better heat conduction under the part if rework is necessary. A full ground plane fill is placed on the bottom of the board. This ground plane serves three important purposes:

First, since a quarter-wave antenna is employed, the ground plane is critical to serve as a counterpoise (please see Application Note AN-00500 "Antennas: Design, Application, and Performance" for details on how a ground plane affects antenna function).

Second, a ground plane suppresses the transfer of noise between stages of a product as well as unintentional radiation of noise into free space.

Third, a ground plane allows for the implementation of a microstrip feed between the module and the antenna. The term microstrip refers to a PCB trace running over a ground plane that is designed to serve as a 50-ohm transmission line. See the LR Series data guide or the calculator available on our website for details on microstrip calculations.

About Antennas

The choice of antennas is one of the most critical and often overlooked design considerations. The range, performance, and legality of an RF link are critically dependent upon the type of antenna employed. Linx offers a variety of antenna styles that can be considered for a design. Included with your kit are CW Series connectorized whip antennas that should be connected prior to using the kit. Despite the fact that the antenna is not centered on the board's ground plane, it exhibits a VSWR of <1.7 and suitably demonstrates the module's best practical performance.

In Closing

Here at Linx, "Wireless Made Simple" is more than just our motto, it is our commitment. A commitment to the highest caliber of product, service, and support. That is why, should you have questions or encounter any difficulties using the evaluation kit, you'll be glad to know many resources are available to assist you. First, check carefully for the obvious, then visit our website at www.linxtechnologies.com or call +1 541 471 6256 between 7AM and 5PM Pacific Time to speak with an application engineer.
