Photocoupler LTV-332J series

LTV-332J series

5.0 Amp Output Current IGBT Gate Driver Optocoupler with Integrated (V_{CE}) Desaturation Detection, UVLO Fault Status Feedback and Active Miller Clamping

1. DESCRIPTION

The LTV-332J is an advanced 5.0 A output current, easy-to-use, intelligent gate driver which makes IGBT V_{CE} fault protection compact, affordable, and easy-to implement. Features such as integrated V_{CE} detection, under voltage lockout (UVLO), “soft” IGBT turn-off, isolated open collector fault feedback and active Miller clamping provide maximum design flexibility and circuit protection.

The LTV-332J contains an AlGaAs LED. The LED is optically coupled to an integrated circuit with a power output stage. LTV-332J is ideally suited for driving power IGBTs and MOSFET used in motor control inverter applications. For IGBTs with higher ratings, the LTV-332J can be used to drive a discrete power stage which drives the IGBTs gate. The LTV-332J has an insulation voltage of $V_{IORM} = 1414 V_{PEAK}$.

The Optocoupler operational parameters are guaranteed over the temperature range from $-40^{\circ}\text{C} \sim +105^{\circ}\text{C}$.

1.1 Features

- Under Voltage Lock-Out Protection (UVLO) with Hysteresis
- Desaturation Detection
- Miller Clamping
- Open Collector Isolated fault feedback
- “Soft” IGBT Turn-off
- Fault Reset by next LED turn-on (low to high) after fault mute period

1.2 Specifications

- 5.0 A maximum peak output current
- 4.0 A minimum peak output current
- 200 ns maximum propagation delay
- 100 ns maximum pulse width distortion (PWD)
- 50 kV/us minimum Common Mode Rejection (CMR) at $V_{CM} = 1500 \text{ V}$
- $I_{CC} = 4.5 \text{ mA}$ maximum supply current
- Guaranteed performance over temperature $-40^{\circ}\text{C} \sim +105^{\circ}\text{C}$.
- 1.7 A Miller Clamp. Clamp pin short to VEE if not used
- Safety approval:
 - UL/ cUL Recognized 5000 $V_{RMS}/1 \text{ min}$ (To be continued)
 - IEC/EN/DIN EN 60747-5-5 $V_{IORM} = 1414 V_{peak}$ (To be continued)

1.3 Applications

- Isolated IGBT/MOSFET gate drive
- Industrial inverters and Uninterruptible power supply (UPS)
- AC and Brushless DC motor drives

1.5 Pin description

Pin	Symbol	Description
1	V_S	Input Ground
2	V_{CC1}	Positive input supply voltage (3.3 V to 5.5 V)
3	\overline{FAULT}	Fault output. \overline{FAULT} changes from a high impedance state to a logic low output within 5 μ s of the voltage on the DESAT pin exceeding an internal reference voltage of 7 V. \overline{FAULT} output is an open collector which allows the \overline{FAULT} outputs from all LTV-332J in a circuit to be connected together in a "wired OR" forming a single fault bus for interfacing directly to the micro-controller.
4	V_S	Input Ground
5	CATHODE	Cathode
6	ANODE	Anode
7	ANODE	Anode
8	CATHODE	Cathode
9	V_{EE}	Output supply voltage
10	V_{CLAMP}	Miller clamp
11	V_{OUT}	Gate drive voltage output
12	V_{EE}	Output supply voltage
13	V_{CC2}	Positive output supply voltage
14	DESAT	Desaturation voltage input. When the voltage on DESAT exceeds an internal reference voltage of 6.5 V while the IGBT is on, \overline{FAULT} output is changed from a high impedance state to a logic low state within 5 μ s.
15	V_{LED}	LED anode. This pin must be left unconnected for guaranteed data sheet performance. (For optical coupling testing only)
16	V_E	Common (IGBT emitter) output supply voltage

1. All Typical values at $T_{\text{A}} = 25^{\circ}\text{C}$ and $V_{\text{CC}} - V_{\text{EE}} = 30\text{ V}, V_{\text{E}} - V_{\text{EE}} = 0\text{ V}$; unless otherwise specified; all minimum and maximum specifications are at recommended operating condition.

2. Maximum pulse width = 10 μs .

This value is intended to allow for component tolerances for designs with I_{O} peak minimum = 4.0 A.

Derate linearly from 5.0 A at $+25^{\circ}\text{C}$ to 2.5 A at $+105^{\circ}\text{C}$. This compensates for increased I_{O} PEAK due to changes in V_{OL} over temperature.

3. This supply is optional. Required only when negative gate drive is implemented.

4. Maximum pulse width = 50 μs .

5. See the Slow IGBT Gate Discharge During Fault Condition section in the applications notes at the end of this data sheet for further details.

Photocoupler LTV-332J series

6. 15 V is the recommended minimum operating positive supply voltage ($V_{CC2} - V_E$) to ensure adequate margin in excess of the maximum V_{UVLO+} threshold of 12.5V. For High Level Output Voltage testing, V_{OH} is measured with a dc load current. When driving capacitive loads, V_{OH} will approach V_{CC} as I_{OH} approaches zero units.
7. Maximum pulse width = 1.0 ms.
8. Once V_O of the LTV-332J is allowed to go high ($V_{CC2} - V_E > V_{UVLO+}$), the DESAT detection feature of the LTV-332J will be the primary source of IGBT protection. UVLO is needed to ensure DESAT is functional. Once V_{CC2} is increased from 0 V to above V_{UVLO+} , DESAT will remain functional until V_{CC2} is decreased below V_{UVLO-} . Thus, the DESAT detection and UVLO features of the LTV-332J work in conjunction to ensure constant IGBT protection.
9. See the DESAT fault detection blanking time section in the applications notes at the end of this data sheet for further details.
10. This is the "increasing" (i.e. turn-on or "positive going" direction) of $V_{CC2} - V_E$
11. This is the "decreasing" (i.e. turn-off or "negative going" direction) of $V_{CC2} - V_E$
12. This load condition approximates the gate load of a 1200 V/150A IGBT.
13. Pulse Width Distortion (PWD) is defined as $|t_{PHL} - t_{PLH}|$ for any given unit.
14. As measured from I_F to V_O .
15. The difference between t_{PHL} and t_{PLH} between any two LTV-332J parts under the same test conditions.
16. As measured from ANODE, CATHODE of LED to VOUT
17. This is the amount of time from when the DESAT threshold is exceeded, until the FAULT output goes low.
18. This is the amount of time the DESAT threshold must be exceeded before V_{OUT} begins to go low, and the FAULT output to go low. This is supply voltage dependent.
19. Auto Reset: This is the amount of time when V_{OUT} will be asserted low after DESAT threshold is exceeded. See the Description of Operation (Auto Reset) topic in the application information section.
20. Common mode transient immunity in the high state is the maximum tolerable dV_{CM}/dt of the common mode pulse, V_{CM} , to assure that the output will remain in the high state (i.e., $V_O > 15$ V or FAULT > 2 V).
21. Common mode transient immunity in the low state is the maximum tolerable dV_{CM}/dt of the common mode pulse, V_{CM} , to assure that the output will remain in a low state (i.e., $V_O < 1.0$ V or FAULT < 0.8 V).
22. To clamp the output voltage at $V_{CC} - 3 V_{BE}$, a pull-down resistor between the output and V_{EE} is recommended to sink a static current of 650 μ A while the output is high. See the Output Pull-Down Resistor section in the application notes at the end of this data sheet if an output pull-down resistor is not used.
23. Split resistors network with a ratio of 1:1 is needed at input LED1. See Figure 13. together.

Note.1. According to UL1577, each Photocoupler is tested by applying an insulation test voltage 6000V_{RMS} for 1 second (leakage current less than 10uA). This test is performed before the 100% production test for partial discharge

Note.2. This is a two-terminal measurement: pins 1-8 are shorted together and pins 9-16 are shorted together.

8. TEMPERATURE PROFILE OF SOLDERING

8.1 IR Reflow soldering (JEDEC-STD-020C compliant)

One time soldering reflow is recommended within the condition of temperature and time profile shown below. Do not solder more than three times.

Profile item	Conditions
Preheat	
- Temperature Min (T_{Smin})	150°C
- Temperature Max (T_{Smax})	200°C
- Time (min to max) (ts)	90±30 sec
Soldering zone	
- Temperature (T_L)	217°C
- Time (t_L)	60 ~ 100 sec
Peak Temperature (T_P)	260°C
Ramp-up rate	3°C / sec max.
Ramp-down rate	3~6°C / sec

Photocoupler LTV-332J series

8.2 Wave soldering (JEDEC22A111 compliant)

One time soldering is recommended within the condition of temperature.

Temperature: $260+0/-5^{\circ}\text{C}$

Time: 10 sec.

Preheat temperature: 25 to 140°C

Preheat time: 30 to 80 sec.

8.3 Hand soldering by soldering iron

Allow single lead soldering in every single process. One time soldering is recommended.

Temperature: $380+0/-5^{\circ}\text{C}$

Time: 3 sec max.

9. Notes:

Specifications of the products displayed herein are subject to change without notice.

The products shown in this publication are designed for the general use in electronic applications such as office automation equipment, communications devices, audio/visual equipment, electrical instrumentation and application. For equipment/devices where high reliability or safety is required, such as space applications, nuclear power control equipment, medical equipment, etc, please contact our sales representatives.
