# 6-Pin DIP Zero-Cross Optoisolators Triac Driver Output
## (600 Volts Peak)

The MOC3061, MOC3062 and MOC3063 devices consist of gallium arsenide infrared emitting diodes optically coupled to monolithic silicon detectors performing the functions of Zero Voltage Crossing bilateral triac drivers.

They are designed for use with a triac in the interface of logic systems to equipment powered from 115/240 Vac lines, such as solid–state relays, industrial controls, motors, solenoids and consumer appliances, etc.

- Simplifies Logic Control of 115/240 Vac Power
- Zero Voltage Crossing
- dv/dt of 1500 V/µs Typical, 600 V/µs Guaranteed
- ***To order devices that are tested and marked per VDE 0884 requirements, the suffix "V" must be included at end of part number. VDE 0884 is a test option.***

**Recommended for 115/240 Vac(rms) Applications:**

- Solenoid/Valve Controls
- Lighting Controls
- Static Power Switches
- AC Motor Drives
- Temperature Controls
- E.M. Contactors
- AC Motor Starters
- Solid State Relays

| Leakage in Inhibited State ($I_F$ = Rated $I_{FT}$, Rated $V_{DRM}$, Off State) | | $I_{DRM2}$ | — | — | 500 | µA |
| Isolation Voltage (f = 60 Hz, t = 1 sec) | | $V_{ISO}$ | 7500 | — | — | Vac(pk) |

1. Test voltage must be applied within dv/dt rating.
2. All devices are guaranteed to trigger at an $I_F$ value less than or equal to max $I_{FT}$. Therefore, recommended operating $I_F$ lies between max $I_{FT}$ (15 mA for MOC3061, 10 mA for MOC3062, 5 mA for MOC3063) and absolute max $I_F$ (60 mA).
3. This is static dv/dt. See Figure 7 for test circuit. Commutating dv/dt is a function of the load–driving thyristor(s) only.

## TYPICAL CHARACTERISTICS

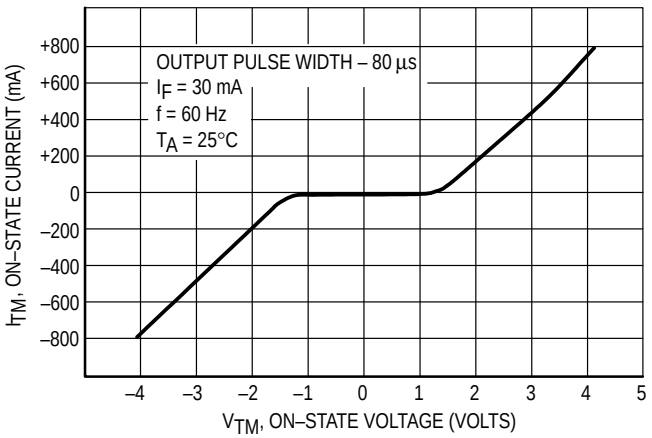

**Figure 1. On–State Characteristics**

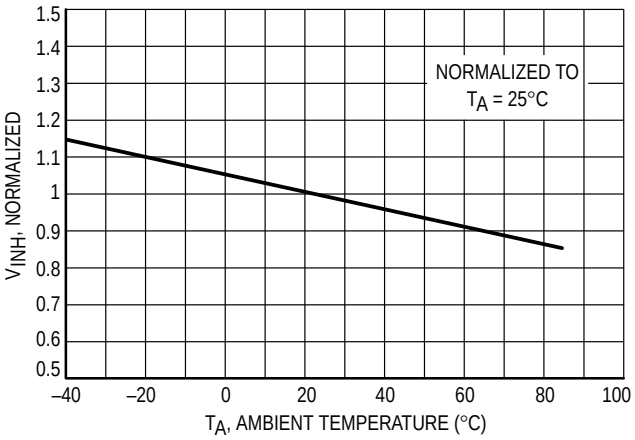

**Figure 2. Inhibit Voltage versus Temperature**

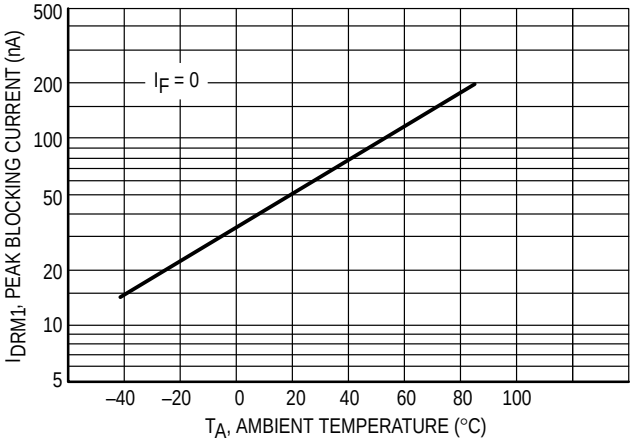

**Figure 3. Leakage with LED Off versus Temperature**

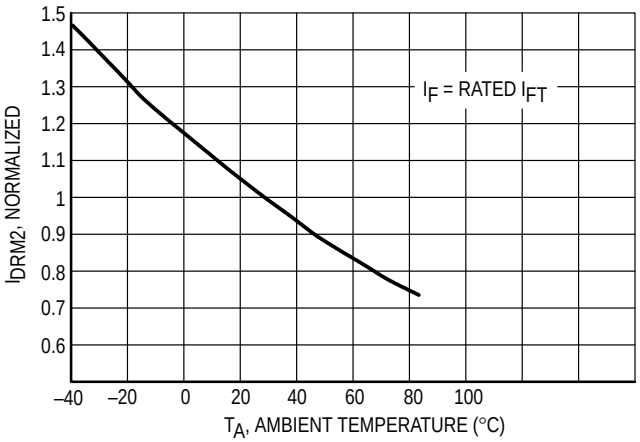

**Figure 4. $I_{DRM2}$, Leakage in Inhibit State versus Temperature**

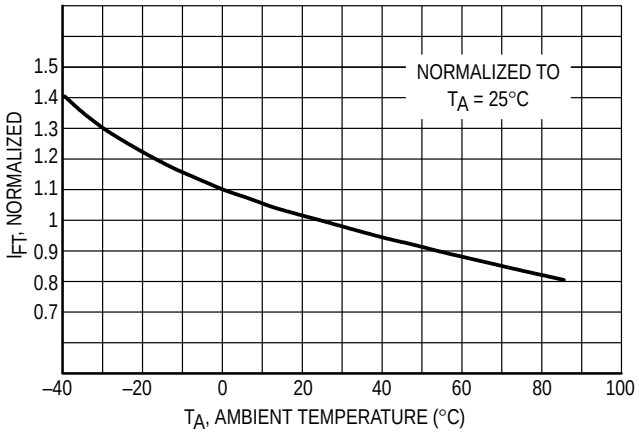

**Figure 5. Trigger Current versus Temperature**

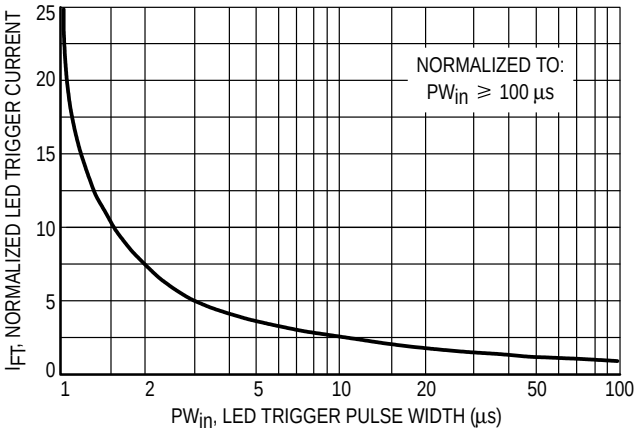

**Figure 6. LED Current Required to Trigger versus LED Pulse Width**

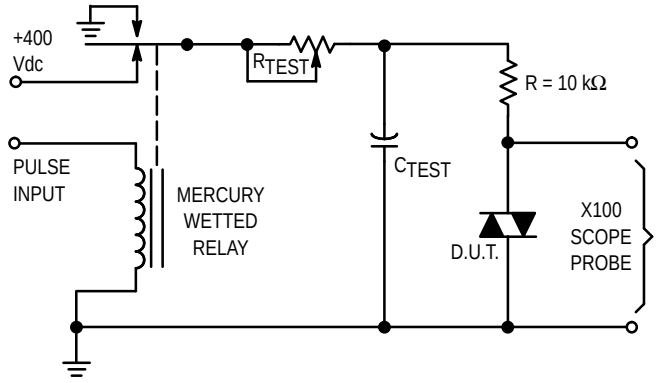

1. The mercury wetted relay provides a high speed repeated pulse to the D.U.T.
2. 100x scope probes are used, to allow high speeds and voltages.
3. The worst–case condition for static dv/dt is established by triggering the D.U.T. with a normal LED input current, then removing the current. The variable $R_{TEST}$ allows the dv/dt to be gradually increased until the D.U.T. continues to trigger in response to the applied voltage pulse, even after the LED current has been removed. The dv/dt is then decreased until the D.U.T. stops triggering. $\tau_{RC}$ is measured at this point and recorded.

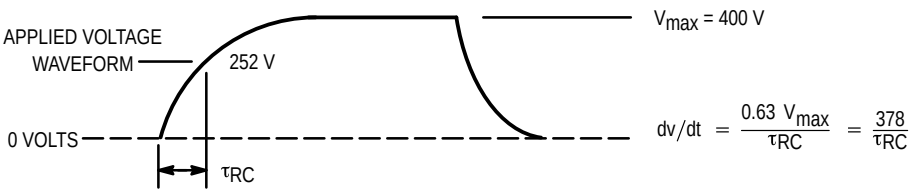

**Figure 7. Static dv/dt Test Circuit**

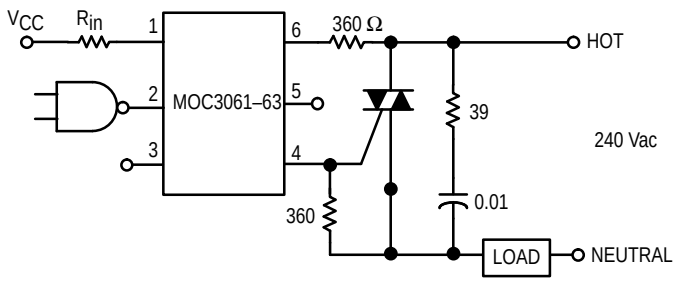

Typical circuit for use when hot line switching is required. In this circuit the “hot” side of the line is switched and the load connected to the cold or neutral side. The load may be connected to either the neutral or hot line.

$R_{in}$ is calculated so that $I_F$ is equal to the rated $I_{FT}$ of the part, 15 mA for the MOC3061, 10 mA for the MOC3062, and 5 mA for the MOC3063. The 39 ohm resistor and 0.01 µF capacitor are for snubbing of the triac and may or may not be necessary depending upon the particular triac and load used.

Suggested method of firing two, back–to–back SCR’s, with a Motorola triac driver. Diodes can be 1N4001; resistors, R1 and R2, are optional 330 ohms.

NOTE: This optoisolator should not be used to drive a load directly. It is intended to be a trigger device only.
