

200mA, Ultra-low Noise LDO Regulator

General Description

The LP3995 is designed for portable applications with demanding performance and space requirements. The LP3995 performance is optimized for high voltage systems to deliver ultra low noise and low quiescent current. Regulator ground current increases only slightly in dropout, further prolonging the input system life. The LP3995 also works with low-ESR ceramic capacitors, reducing the amount of board space necessary for power applications, critical in hand-held wireless devices. The other features include ultra low dropout voltage, high output accuracy, current limiting protection, and high ripple rejection ratio.

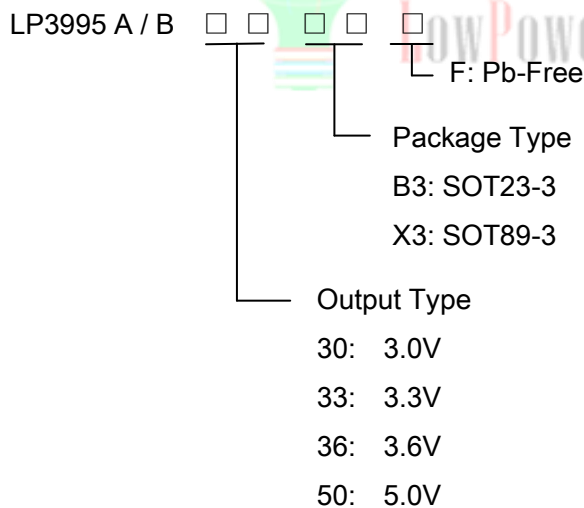

Features

- ◆ Ultra-Low-Noise for RF Application
- ◆ Input Voltage up to 35V
- ◆ Low Dropout : 600mV @ 100mA
- ◆ Output Current $\geq 200\text{mA}$
- ◆ Ultra-Fast Response in Line/Load Transient
- ◆ Current Limiting and Thermal Shutdown Protection

Applications

- ◇ PMP/PDA/MP3 players
- ◇ Cellular and Mobile phone
- ◇ RF Module
- ◇ Sensor Module

Applications Information

Like any low-dropout regulator, the external capacitors used with the LP3995 must be carefully selected for regulator stability and performance. Using a capacitor whose value is $\geq 10\mu\text{F}$ on the LP3995 input. The input capacitor must be located a distance of not more than 0.5 inch from the input pin of the IC and returned to a clean analog ground. Any good quality ceramic or tantalum can be used for this capacitor. The capacitor with larger value and lower ESR (equivalent series resistance) provides better PSRR and line-transient response. The output capacitor must meet both requirements for minimum amount of capacitance and ESR in all LDO's application. The LP3995 is designed specifically to work with low ESR ceramic output capacitor in space-saving and performance consideration. Using a ceramic capacitor whose value is at least $10\mu\text{F}$ with ESR is $> 25\text{m}\Omega$ on the LP3995 output ensures stability. The LP3995 still works well with output capacitor of other types due to the wide stable ESR range. Output capacitor of larger capacitance can reduce noise and improve load transient response, stability, and PSRR. The output capacitor should be located not more than 0.5 inch from the V_{OUT} pin of the LP3995 and returned to a clean analog ground.

Thermal Considerations

Thermal protection limits power dissipation in LP3995. When the operation junction temperature exceeds 150°C , the OTP circuit starts the thermal shutdown function turn the pass element off. The pass element turns on again after the junction temperature cools by 25°C . For continue operation, do not exceed absolute maximum operation junction temperature 125°C .

The power dissipation definition in device is:

$$P_D = (V_{\text{IN}} - V_{\text{OUT}}) \times I_{\text{OUT}} + V_{\text{IN}} \times I_Q$$

The maximum power dissipation depends on the thermal resistance of IC package, PCB layout, the rate of surroundings airflow and temperature difference between junction and ambient.

The maximum power dissipation can be calculated by following formula:

$$P_{D(\text{MAX})} = (T_{J(\text{MAX})} - T_A) / \theta_{JA}$$

Where $T_{J(\text{MAX})}$ is the maximum operation junction temperature 125°C , T_A is the ambient temperature and the θ_{JA} is the junction to ambient thermal resistance. For recommended operating conditions specification of LP3995, the junction to ambient thermal resistance (θ_{JA} is layout dependent) for LP3995 showed below.

$$\text{SOT23-3 : } 250^\circ\text{C/W}$$

$$\text{SOT89-3 : } 165^\circ\text{C/W}$$

And ,

$$P_D = (125^\circ\text{C} - 25^\circ\text{C}) / 250^\circ\text{C/W} = 400\text{mW (SOT23-3)}$$

$$P_D = (125^\circ\text{C} - 25^\circ\text{C}) / 165^\circ\text{C/W} = 600\text{mW (SOT89-3)}$$

The maximum power dissipation depends on operating ambient temperature for fixed $T_{J(\text{MAX})}$ and thermal resistance θ_{JA} .
