### Description

The XP1044 is a highly linear 2-stage power amplifier capable of 18.5 dB of gain, 34 dBm of power at 1 dB compression and is housed in an RoHS compliant 7 mm package. The XP1044 provides less than 2.5% EVM at 26 dBm output power with 802.16 OFDM signal and peak to average ratio 9.17 dB. The input and output of the device are internally pre-matched facilitating a simplified input and output match. This product operates off an 8 V voltage supply and requires negative voltage which is used for current control.

The XP1044-QL is specifically designed for WiMAX applications between 4.9 GHz and 5.9 GHz, and the performance can be shifted by adding external matching components to cover applications between 4 GHz and 5 GHz.

Moisture Sensitivity Level (MSL)	MSL3
Thermal Resistance <sup>5</sup> ( $R_{TH}$ )	+15.6°C

2. Exceeding any one or combination of these limits may cause permanent damage to this device.

3. MACOM does not recommend sustained operation near these survivability limits.

4. Calculate maximum operating backside temperature using:  $T_{max} = 167^\circ\text{C} - [V_D * I_{DD2} * R_{TH}]$ . Thermal resistance of the 1st stage is  $2x R_{TH}$  of the output stage, and therefore  $I_{DD1}$  must not exceed  $\frac{1}{2} I_{DD2}$  for a specific maximum temperature.

5. Thermal resistance of stage 2 only.

### App Note [1] Biasing -

The XP1044-QL requires power supply sequencing. Negative voltage supply ( $V_G$ ) needs to be turned on first and then positive voltage can be applied to the drain ( $V_D$ ). When turning off the device, the positive supply ( $V_D$ ) should be turned off first and then negative voltage ( $V_G$ ) can be removed.

The gate voltage is adjusted in order to set the drain current to the desired level. The gate voltage required to achieve a certain current can vary over temperature and from one device to another due to pinch-off voltage variation. Constant drain current can be achieved by implementing an active bias circuit which allows for temperature compensation and eliminates the effect of pinch off voltage variation.

The input stage transistor periphery is half of the output stage transistor periphery and therefore the gate voltages needed to set the first stage current to 300 mA and the second stage current to 600 mA are the same. The gate voltages can be connected together and a single active bias circuit can be implemented adding a total of 6 components.

### Handling Procedures

Please observe the following precautions to avoid damage:

### Static Sensitivity

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these class 2 devices.
