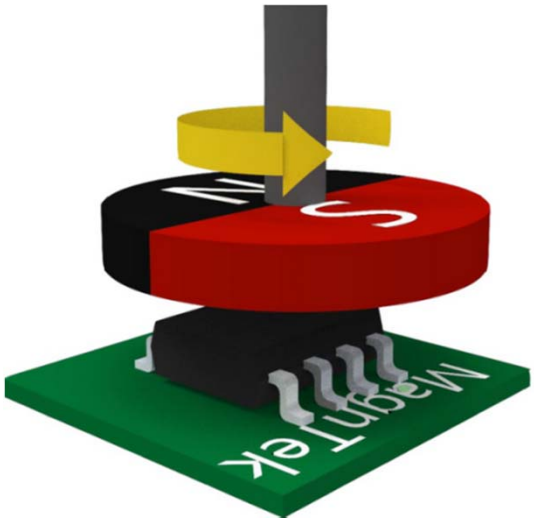
MT6815

Magnetic Angle Position Encoder Sensor

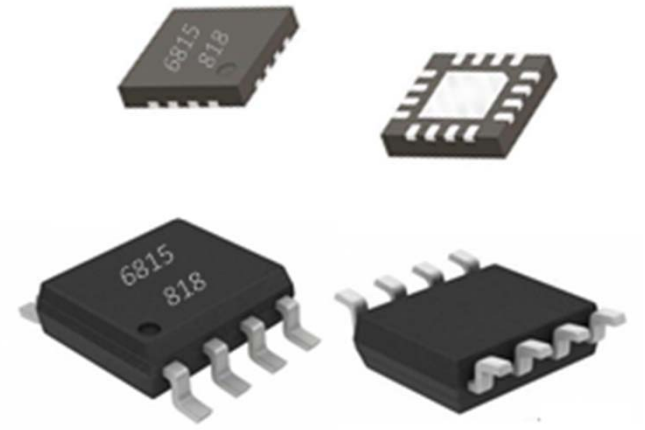
Features and Benefits

- Based on advanced AMR Sensing Technology with 0°~360° Full Range Angle Sensing
- Contactless Angle Measurement
- Independent Output Interface: I²C, SPI, Analog， ABZ, PWM and UVW
- Incremental ABZ programmable binary and decimal pulse-counts: 32, 48, 64, 128, 256, 512, 1024, 2048, 100, 200, 500, 1000, 2000, 2500 pulses per cycle
- 14 bit Core Resolution
- 12 bit DAC/PWM Resolution
- User Programmable Resolution & Zero Index Position
- RoHS Compliant 2011/65/EU
- SOP-8 or QFN-16 Package



Applications

- Absolute Linear Position Sensor
- BLDC Motor Control
- Robotics Control
- Contactless Potentiometer
- Power Tools



General Description

The MagnTek rotary position sensor MT6815 is an IC based on advanced AMR magnetic sensing technology. A rotating magnetic field in the x-y sensor plane delivers two sinusoidal output signals indicating the angle (α) between the sensor and the magnetic field direction. Within a homogeneous field in the x-y plane, the output signals are relatively independent of the physical placement in the z direction.

The sensor is only sensitive to the magnetic field direction as the sensing element output is specially designed to be independent from the magnet field strength. This allows the device to be less sensitive to magnet variations, stray magnetic fields, air gap changes and off-axis misalignment.

The incremental ABZ output mode is available in this sensor series, making the chip suitable to replace various optical encoders. The maximum resolution is 2048 pulse/8192 steps per revolution in binary mode and 2500 pulse/10000 steps per revolution in decimal mode.

A standard I²C or SPI (3-Wire or 4-Wrie) interface allows a host microcontroller to read the 14-bit absolute angle position data from MT6815. The absolute angle position is also provided as PWM output or linear analog signal proportional to VDD from a 12 bit DAC.

2. Functional Diagram

The MT6815 is manufactured in a CMOS standard process and uses advanced magnet sensing technology to sense the magnetic field distribution across the surface of the chip. The integrated magnetic sensing element array is placed around the center of the device and delivers a voltage representation of the magnetic field at the surface of the IC.

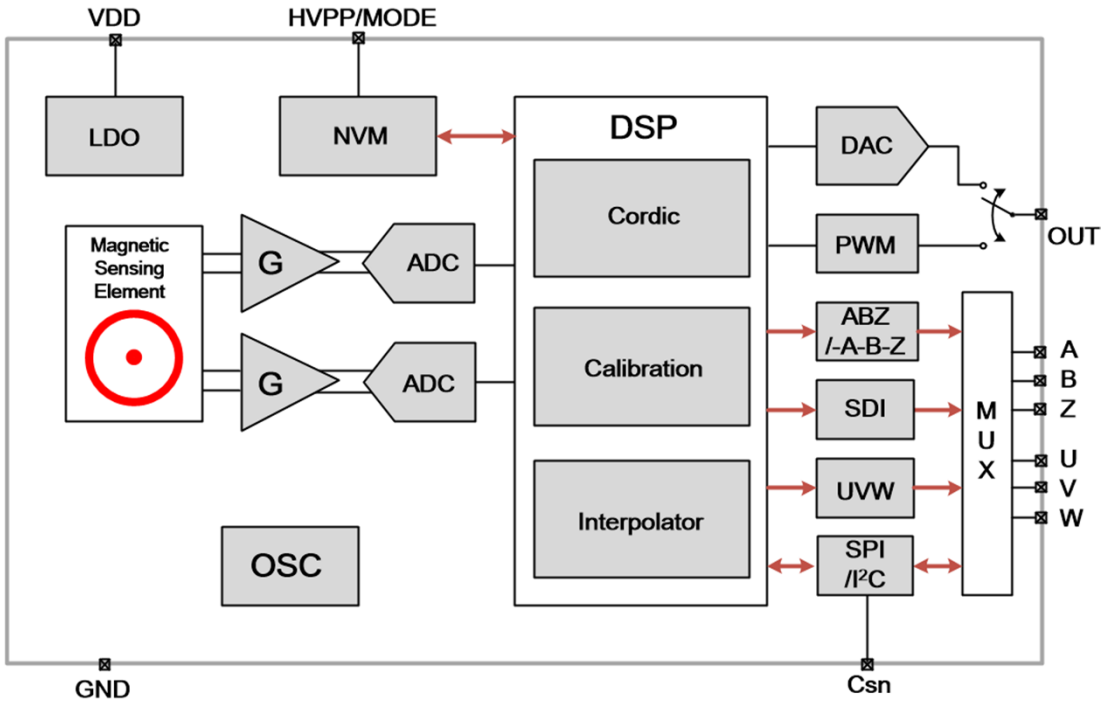

Figure 3: Block Diagram

Figure 3 shows a simplified block diagram of the chip, consisting of the magnetic sensing element modeled by two interleaved Wheatstone bridges to generate cosine and sine signals, gain stages, analog-to-digital converters (ADC) for signal conditioning, and a digital signal processing (DSP) unit for encoding. Other supporting blocks such as LDO, etc. are also included.

3. Absolute Maximum Ratings (Non-Operating)

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated under "Operating Conditions" is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note (1): The typical error value can be achieved at room temperature and with no off-axis misalignment error. The maximum error value can be achieved over operation temperature range, at maximum air gap and with worst-case off-axis misalignment error.

Note (2): The analog output is by design ratiometric, i.e. it is proportional to the supply voltage VDD. The ratiometric error is calculated as follows.

$$\mathrm{Erm} = [\frac{Vout(V_{DD})}{V_{DD}} - \frac{Vout(5\mathrm{V})}{5V}] \cdot 100\%$$

6. Output Mode

The MT6815 provides ABZ, SDI, UVW, Analog and PWM at output pins, also angle position data could be transferred by I²C or SPI interface.

6.1 I/O Pin Configuration

For SOP-8 package, ABZ (Single-end), SDI (Single-end), I²C and SPI are configured to Pin.5, Pin.6 and Pin.7. Analog and PWM output is configured to Pin.3.

6.2 Step, Direction and Index Output (SDI Mode)

In this mode, output 'Step' has a pulse width of 1 LSB, output 'Dir' indicates the direction of the magnet rotation; Output Index is the same as output Z in Quadrature A/B mode as shown in Figure 7.

6.3 Quadrature A,B and Zero-Position Output (ABZ Mode)

As shown in Figure 7, when the magnet rotates clock-wise (CW), output A leads output B by 1/4 cycle (or 1 LSB); When the magnet rotates counter-clock-wise (CCW), output B leads output A by 1/4 cycle. Output Z indicates the zero position of the magnet and the pulse width of Z is selectable as 1, 2 or 4 LSBs. It is guaranteed that one Z pulse is generated for every rotation. The zero position is user programmable。

6.7 I²C Interface

The MT6815 provides a slave I²C interface for host MCU to read back digital absolute angle information from its internal registers. The reference circuit for I²C interface is shown in Figure 14, whether the need for pull-up resistor on SCL is determined by MCU, for MT6815 SCL is a digital input.

6.7.2 I²C Read Angle Registers

The slave ID of MT6815 is b' 0000110 in 7 bit binary form. The 14 bits angle data is stored in internal register 0x03 and 0x04. Please follow the I²C timing of Figure 16 to read the angle data from 0x03 and 0x04 registers.

Note: Please read Register 0x03 first and then read 0x04

0~360° absolute angle θ could be calculated by the below formula:

$$\theta = \frac{\sum_{i=0}^{13} Angle<i> \cdot 2^i}{16384} \bullet 360°$$

Bit 0x04[1] is a diagnosed bit for No Magnet Detected. When the MT6815 could not detect enough magnetic field for proper operation, this bit is set to high.

6.7.3 I²C Burst Read

The MT6815 provides an I²C burst read mode as shown in Figure 17 for faster data rate than single byte read mode.

6.8 SPI Interface

The MT6815 also provides a 4-Wire or 3-Wire SPI (Register 3W_SPI should be programmed to 'High' to enable 3-Wire SPI Mode) interface for host MCU to read back digital absolute angle information from its internal registers. The reference circuit for SPI interface is shown in Figure 19 and Figure 20.

Notes:

(1) The MT6815 has a burst mode. When this mode is enabled, the chip internal clock frequency is doubled and the minimum T_{SCK} also could be reduced to 200ns

(2) The MT6815 has a burst mode. When this mode is enabled, the chip internal clock frequency is doubled and the minimum T_{SCKL} and T_{SCKH} also could be reduced to 100ns

6.8.2 4-Wire SPI

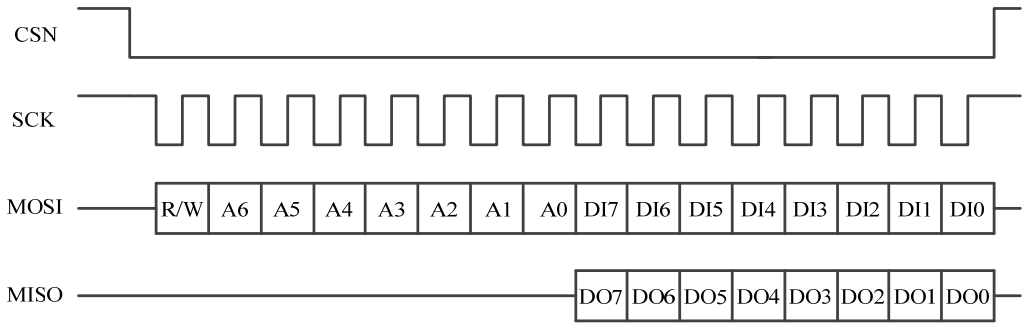

Figure 22: 4-Wire SPI Timing

An SPI data transfer starts with the falling edge of CSN and stops at the rising edge of CSN. SCK is the Serial Port Clock and it is controlled by the SPI master, it is high when there is no SPI transmission. MOSI (master output slave input) and MISO (master input slave output) is the Serial Port Data Input and Output, it is driven at the falling edge of SCK and should be captured at the rising edge of SCK.

Bit 0: R/W bit, when it is 0, the data DI7~DI0 is written into the device, when it is 1, the data DO7~DO0 from the device is read.

7. Magnet Placement

It is required that the magnet' s center axis be aligned with the sensing element center of MT6815 with the air-gap as small as possible. Any misalignment introduces additional angle error and big air-gap also weakens the magnet field which could be sensed by the device. Magnets with larger diameter are more tolerant to DISP (off-axis misalignment) and big AG (air-gap between Magnet and device).
