

## Ratiometric Linear Hall-Effect IC, Analog Output

### 1 Product Description

The MT910X device is a linear Hall effect IC that responds proportionally to magnetic flux density. The device can be used for accurate position sensing in a wide range of applications.

The device operates from 3.0V to 5.5V power supplies. When no magnetic field is present, the analog output drives ½ of Vcc. The output changes linearly with the applied magnetic flux density, and four sensitivity options enable maximal output voltage swing based on the required sensing range. North and south magnetic poles produce unique voltages.

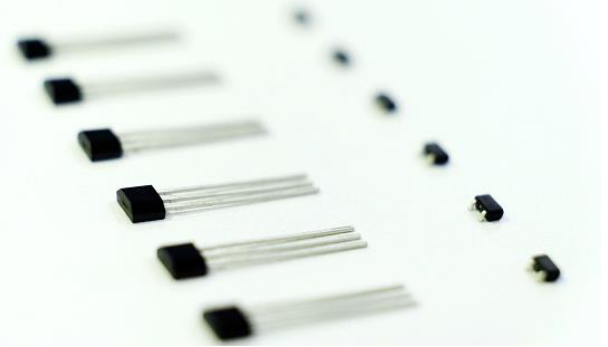

The MT910X family provides a variety of packages to customers. SOT-23 (Thin Outline) for surface mount and flat TO-92 for through-hole mount. All packages are RoHS compliant.

## 7 Function Description

The device produces a linear response when the output voltage is within the specified voltage range. Outside this range, sensitivity is reduced and nonlinear

## 8 Feature Description

The MT910X device is sensitive to the magnetic field component that is perpendicular to the top of the package

When the magnetic field moving from the left side of the IC to the middle which showed in the left of the Figure.3, the  $V_{OUT}$  changing from 0.3 to 2.5V linearity when  $V_{CC}=5V$

When the magnetic field located at the middle of the IC which showed in the middle of the Figure.3, the  $V_{OUT}$  is 2.5V (1/2 of the  $V_{CC}=5V$ )

When the magnetic field moving from the middle side of the IC to the right which showed in the right of the Figure.3, the  $V_{OUT}$  changing from 2.5 to 4.7V linearity when  $V_{CC}=5V$

### 10.1 Absolute Maximum Ratings

Absolute maximum ratings are limited values to be applied individually, and beyond which the serviceability of the circuit may be impaired. Functional operability is not necessarily implied. Exposure to absolute maximum rating conditions for an extended period of time may affect device reliability.
