73S8009CN
Combo ISO-7816 and USB Universal Smart Card Interface IC

Simplifying System Integration™

DATA SHEET

DS_8009C_026 **August 2009**

ISO/IEC 7816-3 ISO/IEC 7816-12 EMVCo

DESCRIPTION

The Teridian 73S8009CN is the world's first single-chip smart card electrical interface circuit that supports all types of smart cards: 5V, 3V and 1.8V, including traditional ISO-7816-3 asynchronous and synchronous type 1 and type 2, as well as USB, ISO-7816-12 cards.

The 73S8009CN is ideally suited for applications such as desktop computers, laptops and general purpose smart card readers that require low power operation from a single 2.7V to 6.5V power supply voltage source. A power down mode ("OFF" mode) is available and exhibits a 10nA typical current consumption.

The circuit provides control, conversion and regulation of power for the smart card. In addition, the circuit provides a 3.3V-regulated voltage that is used as an internal digital supply voltage to the host interface. It is also made available to supply power to some external circuitry (a host controller for instance).

For asynchronous and synchronous smart card operation, the signals for RST, CLK, I/O and auxiliary signals AUX1 and AUX2 are directly controlled from the host processor and are level-shifted by the circuit to the selected V_{CC} value. For more design flexibility, the host processor is responsible for handling the signal timing for smart card activation and de-activation under normal conditions.

The power management circuitry allows operation from a single power supply source V_{PC} (2.7V to 6.5V). V_{PC} is converted using an inductive, step-up power converter to the intermediate voltage, V_P. V_P is used by linear voltage regulators and switches internal to the IC to create the voltages V_{DD} and as required, V_{CC}. V_{DD} is used by the 73S8009CN and is also made available for the companion host processor circuit or for other external circuits.

The 73S8009CN features an ON/OFF pin suitable to connect to a "push-on/push-off" main system switch. When the 73S8009CN is "OFF," the typical current drawn from VPC is 10nA. For applications that do not implement any ON/OFF system switch, the ON/OFF input pin can be driven from a digital output of the host processor.

FEATURES

- Smart Card Interface:
  - Smart card voltage V_{CC}:
    - Selectable: 1.8V, 3V or 5V
    - Generated by an internal voltage regulator
    - Provides up to 65mA to 3V and 5V cards and up to 40mA to 1.8V cards
  - ISO-7816-3 card emergency deactivation
  - Voltage supervisor detects voltage drop on V_{CC} (card supply)
  - True card over-current detection 150mA max.
  - 1 input for a card presence detection switch
  - Auxiliary I/O lines for synchronous and ISO-7816-12 USB card support
  - Proper isolation of smart card signals depending on smart card type
  - Card CLK clock frequency up to 20MHz
  - 6kV ESD and short circuit protection on the card interface
- System Controller Interface:
  - Digital logic level: 3.3V
  - 5 signal images of the card signals (RSTIN, CLKIN, I/OUC, AUX1UC and AUX2UC)
  - 1 control signal to switch between synchronous / asynchronous and ISO-7816-12 USB smart card modes
  - 2 inputs activate and select the card voltage ($\overline{\text{CMDVCC5}}$ and $\overline{\text{CMDVCC3}}$)
  - 2 outputs, interrupt to the system controller ($\overline{\text{OFF}}$ and RDY), to inform the system controller of the card presence / faults and status of the interface
  - 1 Chip Select input
  - 2 handshaking signals (OFF_REQ, OFF_ACK) for proper shutdown sequencing of all smart card signals
- ON/OFF Input for a Main System Switch
- DC-DC Step-up Converter:
  - Generates an intermediary voltage V_P
  - Requires a single 10µH Inductor (rated for 400mA maximum peak current)
- V_{DD} power supply output available to power up external circuitry: 3.3V ±0.3V, 40mA
- Industrial temperature range (-40 °C to +85 °C)
- Small format QFN32 package: 5x5mm
- RoHS compliant (6/6) lead-free package

Tables

1 Pinout

The 73S8009CN is supplied as a 32-pin QFN package.

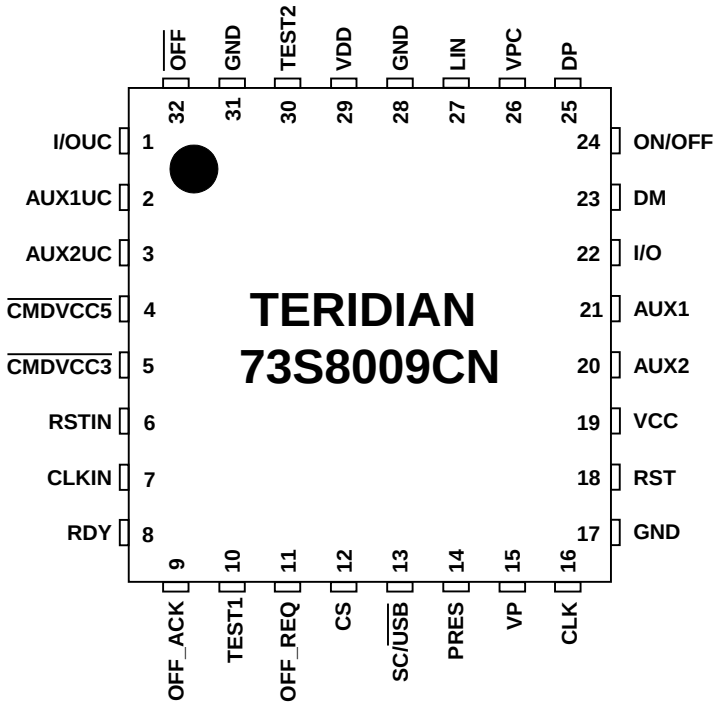

Figure 2: 73S8009CN 32-Pin QFN Pinout

Table 1 describes the pin functions for the device.

Table 1: 73S8009CN Pin Definitions

Pin Name	Pin Number	Type	Equivalent Circuit	Description
Card Interface				
I/O	22	IO	Figure 17	Card I/O: Data signal to/from smart card. Includes an 11kΩ pull-up resistor to V_{CC} Will be tri-stated when SC/$\overline{USB}$ is set low.
AUX1	21	IO	Figure 17	AUX1: Auxiliary data signal to/from smart card for synchronous smart card operation. Smart card USB DP signal for IS0-7816-12 USB smart card operation. Includes an 11kΩ pull-up resistor to V_{CC} for synchronous / asynchronous operation only.
AUX2	20	IO	Figure 17	AUX2: Auxiliary data signal to/from smart card for synchronous smart card operation. Smart card USB DM signal for IS0-7816-12 USB smart card operation. Includes an 11kΩ pull-up resistor to V_{CC} for synchronous / asynchronous operation only.
RST	18	O	Figure 16	Card reset: provides reset (RST) signal to card. RST is the pass through signal on RSTIN. Internal control logic will hold RST low when card is not activated or VCC is too low. Will be tri-stated when SC/$\overline{USB}$ is set low.

Pin Name	Pin Number	Type	Equivalent Circuit	Description
CLK	16	O	Figure 15	Card clock: provides clock signal (CLK) to card. CLK is the pass through of the signal on pin CLKIN. Internal control logic will hold CLK low when card is not activated or VCC is too low. Will be tri-stated when SC/$\overline{\text{USB}}$ is set low.
PRES	14	I	Figure 19	Smart card Presence switch: Active high indicates card is present. Smart card activation will not be permitted unless PRES is active.
VCC	19	PSO	Figure 13	Card power supply – logically controlled by sequencer, output of LDO regulator. Requires an external 0.47uF low ESR filter capacitor to GND.
GND	17	GND	–	Card ground.
Host Processor Interface				
CS	12	I	Figure 19	Chip Select. When CS = 1, the control and signal pins are configured normally. When CS is set low, $\overline{\text{CMDVCC5}}$, RSTIN, and $\overline{\text{CMDVCC3}}$ are latched. I/OUC, AUX1UC, and AUX2UC are set to high-impedance pull-up mode and do not pass data to or from the smart card. Signals RDY and $\overline{\text{OFF}}$ are disabled to prevent a low output and the internal pull-up resistors are disconnected. Should be tied to VDD when a single 73S8009CN is used.
$\overline{\text{OFF}}$	32	O	Figure 12	Interrupt signal to the processor. Active Low - Multi-function indicating fault conditions and card presence. Open drain output configuration – It includes an internal 20kΩ pull-up to $V_{DD.}$ Pull-up is disabled in Power down state and CS = 0 modes.
I/OUC	1	IO	Figure 18	System controller data I/O to/from the card. Includes an 11kΩ pull-up resistor to $V_{DD.}$
AUX1UC	2	IO	Figure 18	System controller auxiliary data I/O to/from the card for synchronous / asynchronous operation mode. Connection to AUX1 is opened when SC/$\overline{\text{USB}}$ is low. Includes an 11kΩ pull-up resistor to $V_{DD.}$
AUX2UC	3	IO	Figure 18	System controller auxiliary data I/O to/from the card for synchronous / asynchronous operation mode. Connection to AUX2 is opened when SC/$\overline{\text{USB}}$ is low. Includes an 11kΩ pull-up resistor to $V_{DD.}$
SC/$\overline{\text{USB}}$	13	I	Figure 19	Smart Card Interface enable, USB interface disable. Pin is provided with a weak pull-up. When high, the 73S8009CN operates in synchronous / asynchronous operation mode. When low, CLK, RST I/O, AUX1, and AUX2 are tri-stated. Pin AUX1 is connected to pin DP and pin AUX2 is connected to pin DM.
DP	25	IO	Figure 14	USB D+ connection to / from USB controller. When SC/$\overline{\text{USB}}$ is set low, this pin is electrically connected to the AUX1 pin, otherwise it is isolated.

Pin Name	Pin Number	Type	Equivalent Circuit	Description
DM	23	IO	Figure 14	USB D- connection to / from USB controller. When SC/$\overline{\text{USB}}$ is set low, this pin is electrically connected to the AUX1 pin, otherwise it is isolated.
$\overline{\text{CMDVCC5}}$ $\overline{\text{CMDVCC3}}$	4 5	I I	Figure 19	Logic low on one or both of these pins will cause the LDO regulator to ramp the Vcc supply to the smart card and smart card interface to the value described in the following table: $\overline{\text{CMDVCC5}}$ $\overline{\text{CMDVCC3}}$ Vcc Output Voltage 0 0 1.8V 0 1 5.0V 1 0 3.0V 1 1 Vcc Off Note: See Card Power Supply and Voltage Supervision for more details.
RSTIN	6	I	Figure 19	Reset Input: This signal is the reset command to the card.
RDY	8	O	Figure 12	Signal to controller indicating the 73S8009CN is ready because V_{CC} is above the required value after $\overline{\text{CMDVCC5}}$ and/or $\overline{\text{CMDVCC3}}$ is asserted low. A 20kΩ pull-up resistor to V_{DD} is provided internally. Pull-up is disabled in Power down state and CS=0 modes.
ON/OFF	24	I	Figure 11	Power control pin. Connected to normally open SPST switch to ground. Closing switch for duration greater than de-bounce period will turn 73S8009CN circuit “on”. If the 73S8009CN is “on,” closing the switch will turn 73S8009CN to “off” state after the de-bounce period and OFF_REQ/OFF_ACK handshake. Can be controlled by a host processor digital output.
OFF_REQ	11	O	Figure 19	Digital output. Request to the host system controller to turn the 73S8009CN off. If ON_OFF switch is closed (to ground) for de-bounce duration and circuit is “on,” OFF_REQ will go high (request to turn OFF). Connected to OFF_ACK via 100kΩ internal resistor.
OFF_ACK	13	I	Figure 19	Setting OFF_ACK high will power “off” all analog functions and disconnect the 73S8009CN from V_{PC}. The pin has an internal 100kΩ resistor connection to OFF_REQ so that when not connected or no host interaction is required, the Acknowledge will be true and the circuit will turn “off” after the deactivation sequence is completed.
Miscellaneous				
CLKIN	7	I	Figure 19	Clock signal source for the card clock.
TEST1	10	–	–	Factory test pin. This pin must be tied to GND.
TEST2	30	–	–	Factory test pin. This pin must be tied to GND.

Pin Name	Pin Number	Type	Equivalent Circuit	Description
Power Supply and Ground				
VDD	29	PSO	Figure 13	System interface supply voltage output and supply voltage for companion controller circuit (40mA maximum source capability). Requires a minimum of two 0.1μF capacitors to ground for proper decoupling.
VPC	26	PSI	Figure 13	Power supply source for main voltage converter circuit. A 10μF and a 0.1μF ceramic capacitor must be connected to this pin.
LIN	27	PSI	Figure 13	Connection to 10μH inductor for internal step up converter. Note: inductor must be rated for 400mA maximum peak current.
VP	15	PSO	Figure 13	Intermediate output of main converter circuit. Requires an external 4.7μF low ESR filter capacitor to GND.
GND	28, 31	GND	–	Ground.

2 Electrical Specifications

This section provides the following:

- Absolute maximum ratings
- Recommended operating conditions
- Smart card interface requirements
- Digital signals characteristics
- Voltage / temperature fault detection circuits
- Thermal characteristics

2.1 Absolute Maximum Ratings

Table 2 lists the maximum operating conditions for the 73S8009CN. Permanent device damage may occur if absolute maximum ratings are exceeded. Exposure to the extremes of the absolute maximum rating for extended periods may affect device reliability.

Table 2: Absolute Maximum Device Ratings

Parameter	Rating
Supply Voltage V_{PC}	-0.5 to 7.0 VDC
V_{DD}	-0.5 to 4.0 VDC
Input Voltage for Digital Inputs	-0.3 to (V_{DD} +0.5) VDC
Storage Temperature	-65 to 150°C
Pin Voltage (except card interface)	-0.3 to (V_{DD} + 0.5) VDC
Pin Voltage (card interface)	-0.3 to (V_{CC} + 0.3) VDC
Pin Voltage, LIN pin	0.3 to 6.5 VDC
ESD Tolerance – Card interface, DP and DM pins	+/- 6kV
ESD Tolerance – Other pins	+/- 2kV
Pin Current, except LIN	± 200 mA
Pin Current, LIN	+ 500 mA in, -200 mA out

2.2 Recommended Operating Conditions

Function operation should be restricted to the recommended operating conditions specified in Table 3.

Table 3: Recommended Operating Conditions

Parameter	Rating
Supply voltage V_{PC}	2.7 to 6.5 VDC
Ambient operating temperature	-40°C to +85°C

2.3 Smart Card Interface Requirements

Table 4 lists the 73S8009CN Smart Card interface requirements.

Table 4: DC Smart Card Interface Requirements

Symbol	Parameter	Condition	Min	Nom	Max	Unit
Card Power Supply (V_{CC}) Regulator General Conditions: -40C < 85C, 2.7 V < V_{PC} < 6.5 V						
V_{CC}	Card supply voltage including ripple and noise	Inactive mode	-0.1	–	0.1	V
		Inactive mode I_{CC} = 1mA	-0.1	–	0.4	V
		Active mode; I_{CC} <65mA; 5V	4.65	–	5.25	V
		Active mode; I_{CC} < 65mA; 3V	2.85	–	3.15	V
		Active mode; I_{CC} < 40mA; 1.8V	1.68	–	1.92	V
		Active mode; single pulse of 100mA for 2μs; 5 volt, fixed load = 25mA	4.6	–	5.25	V
		Active mode; single pulse of 100mA for 2μs; 3V, fixed load = 25mA	2.76	–	3.15	V
		Active mode; current pulses of 40nAs with peak $\|I_{CC}\|$ <200mA, t <400ns; 5V	4.6	–	5.25	V
		Active mode; current pulses of 40nAs with peak $\|I_{CC}\|$ <200mA, t <400ns; 3V	2.7	–	3.15	V
		Active mode; current pulses of 20nAs with peak $\|I_{CC}\|$ <100mA, t <400ns; 1.8V	1.62	–	1.92	V
V_{CCrip}	V_{CC} ripple	f_{RIPPLE} = 20KHz – 200MHz		–	350	mV
I_{CCmax}	Card supply output current	Static load current, V_{CC}>1.65		–	40	mA
		Static load current, V_{CC}>4.6 or 2.7 volts as selected		–	65	mA
I_{CCF}	I_{CC} fault current	Class A, B (5V and 3V)	75	–	150	mA
		Class C (1.8V)	55	–	130	mA
V_S	Vcc slew rate, rise and fall	C = 0.5μF	0.10	0.30	0.70	V/μs
V_{rdy}	Vcc ready voltage (RDY = 1)	5V operation, Vcc rising	4.6	–	–	V
		3V operation, Vcc rising	2.75	–	–	V
		1.8V operation, Vcc rising	1.65	–	–	V
V_{CCF}	RDY = 0 (V_{CC} voltage supervisor threshold)	V_{CC} = 5V	–	–	4.6	V
C_{VPC}	External filter cap for V_{PC}		8.0	10.0	12.0	μF
Cvp	External filter cap for VP		2.0	4.7	6.8	μF
C_F	External filter capacitor (V_{CC} to GND)	C_F should be ceramic with low ESR (<100mΩ).	0.2	0.47	1.0	μF
C_{VDD}	VDD filter capacitor		0.2	–	1.0	μF

Symbol	Parameter	Condition	Min	Nom	Max	Unit
Interface Requirements – Data Signals: I/O, AUX1, AUX2, and host interfaces: I/OUC, AUX1UC, AUX2UC, DP, DM. I_{SHORTL}, I_{SHORTH}, and V_{INACT} requirements do not pertain to I/OUC, AUX1UC, AUX2UC						
V_{OH}	Output level, high (I/O, AUX1, AUX2)	I_{OH} =0	0.9 * V_{CC}	–	V_{CC}+0.1	V
V_{OH}	Output level, high (I/OUC, AUX1UC, AUX2UC)	I_{OH} = -40µA	0.75 V_{CC}	–	V_{CC}+0.1	V
		I_{OH} =0	0.9 V_{DD}	–	V_{DD}+0.1	V
V_{OL}	Output level, low (I/O, AUX1, AUX2)	I_{OH} = -40µA	0.75 V_{DD}	–	V_{DD}+0.1	V
		I_{OL}=1mA	–	–	0.15 *V_{CC}	V
V_{OL}	Output level, low (I/OUC, AUX1UC, AUX2UC)	I_{OL}=1mA	–	–	0.3	V
V_{IH}	Input level, high (I/O, AUX1, AUX2)		0.6 * V_{CC}	–	V_{CC}+0.30	V
V_{IH}	Input level, high (I/OUC, AUX1UC, AUX2UC)		0.6 * V_{DD}	–	V_{DD}+0.30	V
V_{IL}	Input level, low (I/O, AUX1, AUX2)		-0.15	–	0.2 * V_{CC}	V
V_{IL}	Input level, low (I/OUC, AUX1UC, AUX2UC)		-0.15	–	0.2 * V_{DD}	V
V_{INACT}	Output voltage when outside of session	I_{OL} = 0	–	–	0.1	V
		I_{OL} = 1mA	–	–	0.3	V
I_{LEAK}	Input leakage	V_{IH} = V_{CC}	–	–	10	µA
Ifloat	Input current	Input current with SC/$\overline{USB}$ = 0	-2	–	+2	µA
I_{IL}	Input current, low (I/O, AUX1, AUX2)	V_{IL} = 0	–	–	0.65	mA
I_{IL}	Input current, low (I/OUC, AUX1UC, AUX2UC)	V_{IL} = 0	–	–	0.7	mA
I_{SHORTL}	Short circuit output current	For output low, shorted to V_{CC} through 33Ω	–	–	15	mA
I_{SHORTH}	Short circuit output current	For output high, shorted to ground through 33Ω	–	–	15	mA
t_R, t_F	Output rise time, fall times	For I/O, AUX1, AUX2, C_L = 80pF, 10% to 90%. For I/OUC, AUX1UC, AUX2UC, CL=50Pf, 10% to 90%.	–	–	100	ns
t_{IR}, t_{IF}	Input rise, fall times		–	–	1	µs
R_{PU}	Internal pull-up resistor	Output stable for >200ns	8	11	14	kΩ
FD_{MAX}	Maximum data rate		–	–	1	MHz
T_{FDIO}	Delay, I/O to I/OUC, AUX1 to AUX1UC, AUX2 to AUX2UC,I/OUC to I/O, AUX1UC to AUX1, AUX2UC to AUX2 (respectively falling edge to falling edge and rising edge to rising edge)	Edge from master to slave, measured at 50%	60	100	200	ns
T_{RDIO}			–	15	–	ns
C_{IN}	Input capacitance		–	–	10	pF
Inusboff	Input current USB off	0 < Vdm, Vdp <3.3V, VCC=5V, SC/$\overline{USB}$ =1	-2	–	+2	µA
Rswitch	Resistance D to Aux	0 < Vdm, Vdp < 3.3V, VCC=5V, SC/$\overline{USB}$ =0	0.5	2	6	Ω

Symbol	Parameter	Condition	Min	Nom	Max	Unit
Reset and Clock for card interface, RST, CLK						
V_{OH}	Output level, high	I_{OH} =-200µA	0.9 * V_{CC}	–	V_{CC}	V
V_{OL}	Output level, low	I_{OL}=200µA	0	–	0.15 *V_{CC}	V
V_{INACT}	Output voltage when outside of session	I_{OL} = 0	–	–	0.1	V
Ifloat	Input current	I_{OL} = 1mA	–	–	0.3	V
		Input current with SC/$\overline{USB}$ = 0, open circuited	-5	–	+5	µA
I_{RST_LIM}	Output current limit, RST		–	–	30	mA
I_{CLK_LIM}	Output current limit, CLK		–	–	70	mA
t_R, t_F	Output rise time, fall time	C_L = 35pF for CLK, 10% to 90%	–	–	12	ns
		C_L = 200pF for RST, 10% to 90%	–	–	100	ns
δ	Duty cycle for CLK	C_L =35pF, F_{CLK} ≤ 20MHz, CLKIN duty cycle is 48% to 52%.	45	–	55	%

2.4 Digital Signals Characteristics

Table 5 lists the 73S8009CN digital signals characteristics.

Table 5: Digital Signals Characteristics

Symbol	Parameter	Condition	Min	Nom	Max	Unit
Digital I/O (except for I/OUC, AUX1UC, AUX2UC; see Smart Card Interface Requirements for those specifications)						
V_{IL}	Input Low Voltage		-0.3	–	0.8	V
VIL_{OFFACK}	Input low voltage for OFF_ACK pin	OFF_REQ pin = VDD	-0.3	–	0.7	V
V_{IH}	Input High Voltage		1.8	–	V_{DD} + 0.3	V
V_{OL}	Output Low Voltage	I_{OL} = 2mA		–	0.45	V
V_{OH}	Output High Voltage	I_{OH} = -1mA	V_{DD} - 0.45	–		V
R_{OUT}	Pull-up resistor; $\overline{OFF}$, RDY		14	20	26	kΩ
R_{ACK}	Resistor between OFF_REQ and 0FF_ACK		70	100	130	kΩ
$\|I_{IL1}\|$	Input Leakage Current	GND < V_{IN} < V_{DD}	–	–	5	µA
t_{SL}	Time from CS goes high to interface active		50	–	–	ns
t_{DZ}	Time from CS goes low to interface inactive, Hi-Z		50	–	–	ns
t_{IS}	Set-up time, control signals to CS rising edge		50	–	–	ns
t_{SI}	Hold time, control signals from CS rising edge		–	–	50	ns
t_{ID}	Set-up time, control signals to CS fall		50	–	–	ns
t_{DI}	Hold time, control signals from CS fall		–	–	50	ns

2.5 DC Characteristics

Table 6 lists the DC characteristics.

Table 6: DC Characteristics

Symbol	Parameter	Condition	Min	Nom	Max	Unit
V_{DD}	V_{DD} Voltage	2.7v < VPC < 6.5v, I_{VDDEXT} < 40mA.	3.0	3.3	3.6	V
I_{DDEXT}	V_{DD} Current to External Load		–	–	40	mA
I_{VPC}	Supply Current	Vpc = 2.7V, V_{CC} off, I_{DD} = 0	–	1.7	–	mA
		Vpc = 3.3V, V_{CC} off, I_{DD} = 0	–	1.1	–	mA
		Vpc = 5.0V, V_{CC} off, I_{DD} = 0	–	0.7	–	mA
		OFF mode	–	0.01	1	μA

2.6 Voltage / Temperature Fault Detection Circuits

Table 7 lists the voltage /temperature fault detection circuits.

Table 7: Voltage / Temperature Fault Detection Circuits

Symbol	Parameter	Condition	Min	Nom	Max	Unit
I_{DDmax}	VDD over-current limit		40	–	100	mA
I_{CCF}	Card overcurrent fault		80	–	150	mA
I_{CCF1P8}	Card overcurrent fault	V_{CC} = 1.8V	60	–	130	mA

2.7 Thermal Characteristics

Table 8 lists the thermal characteristics.

Table 8: Thermal Characteristics

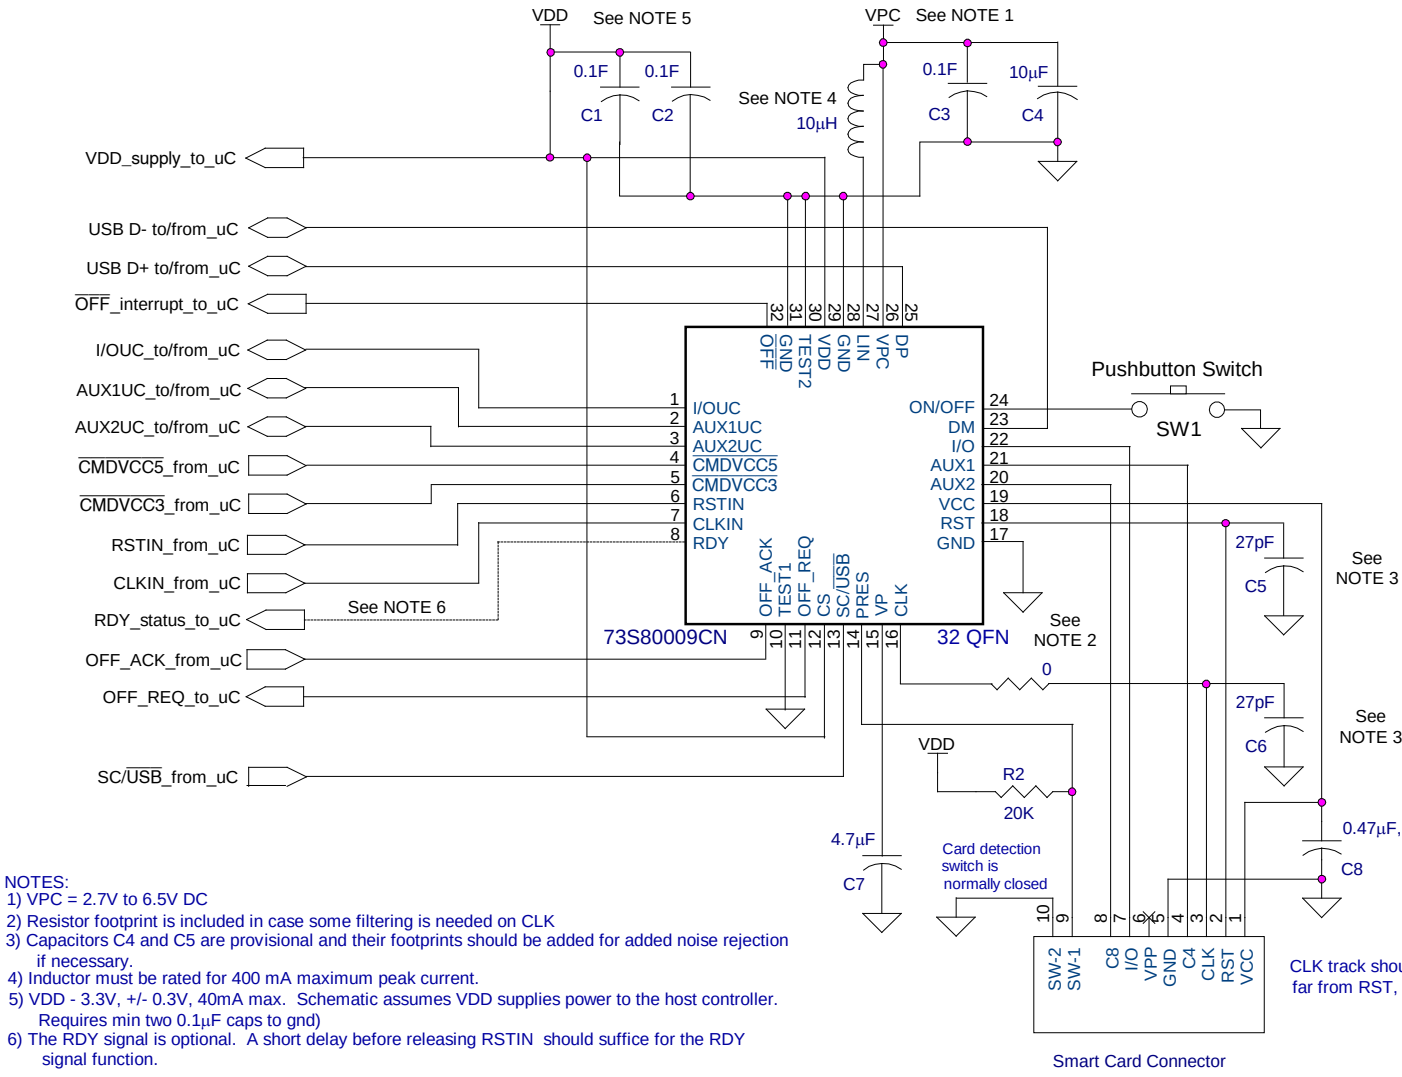
Symbol	Parameter	Condition	Min	Nom	Max	Unit
Tj	Junction temperature		–	–	125	°C
θ ja	Thermal Resistance, Junction-to-Ambient		–	70	–	°C/W
θ jc	Thermal Resistance, Junction-to-case		–	6	–	°C/W

3 Applications Information

This section provides general usage information for the design and implementation of the 73S8009CN. The documents listed in Related Documentation provide more detailed information.

3.1 Example 73S8009CN Schematics

Figure 3 shows a typical application schematic for the implementation of the 73S8009CN with a main system switch. Figure 4 shows a typical application schematic for the implementation of the 73S8009CN without a main system switch. Note that minor changes may occur to the reference material from time to time and the reader is encouraged to contact Teridian for the latest information.



NOTES:
1) VPC = 2.7V to 6.5V DC
2) Resistor footprint is included in case some filtering is needed on CLK
3) Capacitors C4 and C5 are provisional and their footprints should be added for added noise rejection if necessary.
4) Inductor must be rated for 400 mA maximum peak current.
5) VDD - 3.3V, +/- 0.3V, 40mA max. Schematic assumes VDD supplies power to the host controller. Requires min two 0.1µF caps to gnd)
6) The RDY signal is optional. A short delay before releasing RSTIN should suffice for the RDY signal function.

Figure 3: Typical 73S8009CN Application Schematic with a Main System Switch

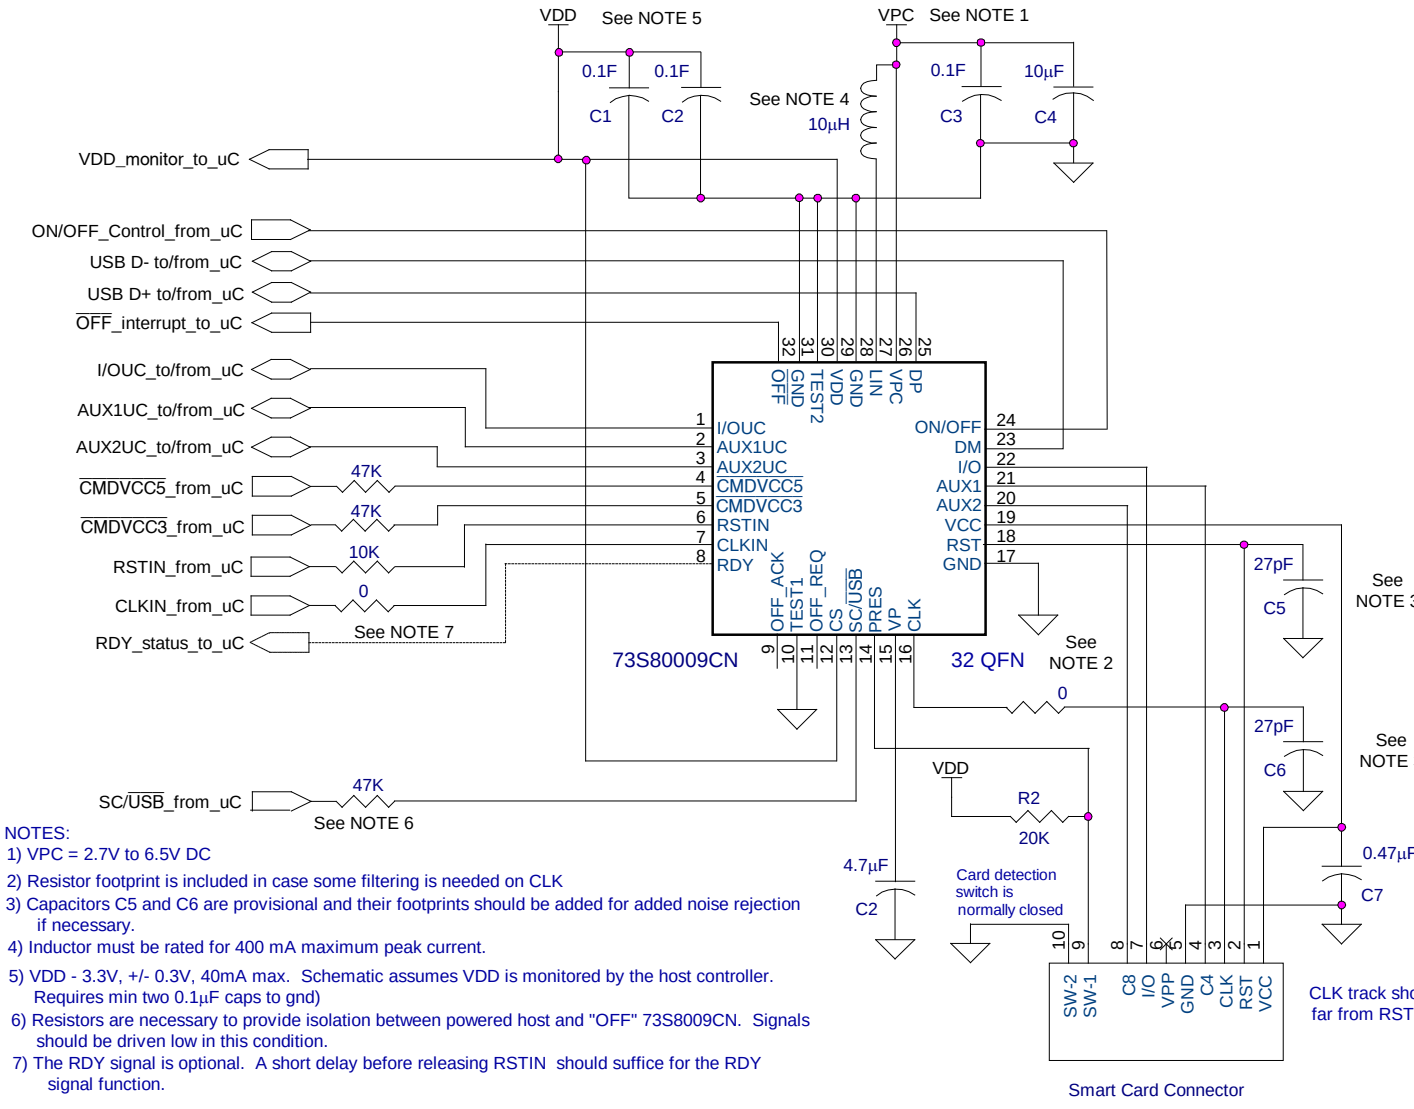


Figure 4: Typical 73S8009CN Application Schematic without a Main System Switch

3.2 Power Supply and Converter

The 73S8009CN power supply and converter circuitry takes power from the V_{PC} input pin. The power supplied to V_{PC} pin is converted to the voltage V_P utilizing an inductive, step-up converter. A series power inductor (nominal value = 10μH) is connected from pin VPC to pin LIN, and a 10μF and a 0.1μF filter capacitor must be connected to V_{PC}. Note: When the V_{PC} input voltage exceeds the nominal V_P voltage (approximately 5.5V), the switching operation of the converter stops and the converter acts as a pass through for V_{PC} to V_P. Switching operation will automatically resume when V_{PC} falls below the nominal V_P voltage.

V_P requires a 4.7μF filter capacitor and will have a nominal value of 5.5 volts during normal operation. V_P is used by the smart card interface circuits (CLK, RST, I/O, AUX1, and AUX2) and is the source of the regulated smart card supply V_{CC}. V_{CC} can be selected for values of 5V, 3V, and 1.8V.

The power supply output V_{DD} is also produced from V_P. V_{DD} is used by the 73S8009CN circuit for logic, input / output buffering with the host. In addition, V_{DD} can be used as a 3.3V regulated power supply for some external circuitry provided that no more than 40mA is needed (simultaneously to the 65mA current drawn from V_{CC}).

3.3 Interface Function - ON/OFF Modes

A power ON/OFF function is provided such that the circuit will be inoperative during the “OFF” state, consuming minimum current from V_{PC}.

Option 1: 73S8009CN supplies host/system power controlled by push button ON/OFF switch:

Refer to Figure 3 for a typical electrical schematic when using an ON/OFF system switch.
The ON/OFF pin shall be connected to an SPST switch to ground. If the circuit is OFF and the switch is closed for a de-bounce period of approximately 100ms, the circuit shall go into the “ON” state wherein all functions are operating in normal fashion. If the circuit is in the “ON” state and the ON/OFF pin is connected to ground for a period greater than the de-bounce period, OFF_REQ will be asserted high and held regardless of the state of ON/OFF. Typically, the OFF_REQ signal is presented to a host controller that will assert OFF_ACK high when it has completed all shutdown activities. When OFF_ACK is set high, the circuit will de-activate the smart card interface if required and turn off all analog functions and the V_{DD} supply for the logic and companion circuits. The OFF_ACK pin is connected internally to OFF_REQ with a resistor such that if OFF_ACK is unconnected, the action of OFF_REQ will assert OFF_ACK high. In this configuration, the circuit shall go into the “OFF” state immediately if the interface is deactivated or immediately after deactivation if previously activated.. The default state upon application of power to V_{PC} is the “OFF”. Note that at any time, the controller may assert OFF_ACK and the 73S8009CN will go into the “OFF” state (regardless of activity on the ON/OFF main system switch).

Option 2: ON/OFF status driven from the host processor (no system switch):

Refer to Figure 4 for a typical electrical schematic when controlling the ON/OFF pin via host control.
The ON/OFF pin can be connected to a host digital control signal to turn the 73S8009CN on or off. The host should monitor the V_{DD} supply to determine when the switch debounce time has been achieved so the 73S8009CN can switch states (ON or OFF). When the 73S8009CN is OFF, the host should drive the ON/OFF pin low to initiate the turn ON process. The signal must remain low until the V_{DD} supply voltage goes to 3.3V. The 73S8009CN is now ON and the ON/OFF pin should be driven back high. To turn off the 73S8009CN, the host should drive the ON/OFF signal low until the V_{DD} supply goes to 0V. The 73S8009CN is now OFF and the ON/OFF pins should be driven back high. See Note 6.

Important Notes:

1. **When the host is not powered by the V_{DD} supply of the 73S8009CN, special care must be taken as the host signals going to the 73S8009CN can be active when the device is powered OFF. This can create issues such as excessive current drain on the control signals and potentially prohibit proper turn ON of the 73S8009CN. Series resistors on the input signals (except the ON/OFF input) are recommended to provide isolation and prevent any potential problems. The recommended value of these resistors is 47kΩ. It is also necessary for the host to set these input signals to the low state (except for ON/OFF) when the 73S8009CN is OFF. False activation of the card is possible if the $\overline{\text{CMDVCC3}}$ or $\overline{\text{CMDVCC5}}$ inputs are low (with a card inserted) when the 73S8009CN is powered ON. For this reason, the proper sequencing of the 73S8009CN is required. The $\overline{\text{CMDVCC3}}$ or $\overline{\text{CMDVCC5}}$ inputs must be set high immediately before the ON/OFF input is taken low to turn on the 73S8009CN. The time between setting the $\overline{\text{CMDVCC3}}$ or $\overline{\text{CMDVCC5}}$ inputs high and the setting of the ON/OFF input set low should be kept to a minimum as the $\overline{\text{CMDVCC3}}$ or $\overline{\text{CMDVCC5}}$ inputs, when set high with the 73S8009CN OFF, will draw significant current under these conditions. The 47kΩ series resistors will mitigate this current draw. However, some additional current will be drawn through the resistors to the $\overline{\text{CMDVCC3}}$ or $\overline{\text{CMDVCC5}}$ inputs during this time so it should be kept to a minimum.**
2. For applications where ON/OFF is controlled by the host, the OFF_REQ and OFF_ACK signals do not need to be connected to the host. When the OFF_ACK pin is left unconnected, the 73S8009CN will turn off properly by the action of the internal resistor connection to OFF_REQ.
3. If the host is capable of selectively monitoring the I/O line, it can be used in place of the V_{DD} supply monitor as it is tied to the V_{DD} supply through a pull up resistor when the smart card interface is not activated.
4. When the 73S8009CN is powered OFF, the host will not be able to detect a card event (card insertion/removal). If this function is necessary, then the host must monitor the card connector switch separately.
5. For systems that do not use VDD to power the host controller, the host interface signals must operate at 3.3V as the 73S8009CN digital logic operates off the V_{DD} (3.3V) supply regardless of the value of the V_{PC} supply.
6. The ON/OFF pin is internally pulled up to V_{PC} through a 24kΩ resistor. Special care must be taken if the host signal controlling the ON/OFF signal is running at a voltage different from V_{PC}. If this is the case, then either the host control signal must be a maximum V_{PC} supply tolerant open drain output or an external circuit should provide some isolation between the host control signal and the ON/OFF pin.
7. For those systems that require low power operation or are battery operated, the host controller circuit firmware should place the 73S8009CN in the OFF state if no card activity is required.

3.4 System Controller Interface

Five separate digital inputs and two outputs allow direct control of the card interface from the host:

- Pin CS: Chip select control.
- Pin $\overline{\text{CMDVCC3}}$ and/or $\overline{\text{CMDVCC5}}$: When low, starts an activation sequence.
- Pin RSTIN: controls the card RST signal.
- Pin SC/$\overline{\text{USB}}$: Routes AUXx signals to AUXxUC or USB Dx pins and provides proper tri-stating functionality.
- Pin RDY: Indicates when smart card power supply is stable and ready.
- Pin $\overline{\text{OFF}}$: Indicator of card presence and any card fault conditions.

Interrupt output to the host: When the card is not activated, the $\overline{\text{OFF}}$ pin informs the host about the card presence only (Low = No card in the reader, high = card inserted). When $\overline{\text{CMDVCC}}$ ($\overline{3}/\overline{5}$ signals) is/are set low (card activation sequence requested from the host), low level on $\overline{\text{OFF}}$ means a fault has been detected (e.g. card removal during card session, or voltage fault, or thermal / over-current fault) that automatically initiates a deactivation sequence. The smart card pass through signals are enabled when the RDY conditions are met.

3.5 Card Power Supply and Voltage Supervision

The 73S8009CN smart card interface IC incorporates an LDO voltage regulator for the card power supply, V_{CC} (V_P to V_{CC} conversion uses an internal LDO). The voltage output is controlled by the digital input sequence of $\overline{\text{CMDVCC3}}$ and $\overline{\text{CMDVCC5}}$. This regulator is able to provide either 1.8V, 3V or 5V card voltage sourced from the V_P power supply. Internal digital circuitry is also powered by the V_P power supply (except for the ON/OFF circuitry which is powered from V_{PC}). A voltage supervisor checks the value of the voltage V_{CC}. A card deactivation sequence is forced upon fault detected by voltage supervisor, overcurrent condition, or card removal event. The voltage regulator can provide a card current of 65mA in compliance with EMV 4.1 for 3-V and 5-V cards. The signals $\overline{\text{CMDVCC3}}$ and $\overline{\text{CMDVCC5}}$ control the turn-on, output voltage value, and turn-off of V_{CC}. When either signal is asserted low, V_{CC} will ramp to the selected value or if both signals are asserted low (within 400ns of each other), V_{CC} will ramp to 1.8V. These signals are edge triggered. If $\overline{\text{CMDVCC5}}$ is asserted low (to command V_{CC} to be 5V) and at a much later time (greater than 2µs, typically), $\overline{\text{CMDVCC3}}$ is asserted low, it will be ignored (and vice versa.)

At the assertion (low) of either or both $\overline{\text{CMDVCC}}$ ($\overline{3}/\overline{5}$ signals), V_{CC} will rise to the requested value. When V_{CC} rises to an acceptable value, and stays above that value for approximately 20µs, RDY will be set high. Approximately 510µs after the fall of $\overline{\text{CMDVCC}}$ ($\overline{3}/\overline{5}$), the circuit will check the see if V_{CC} is at or above the required minimum value (indicated by RDY=1) and if not, will begin an emergency deactivation sequence. During the 510µs time, card removal, or de-assertion of $\overline{\text{CMDVCC}}$ ($\overline{3}/\overline{5}$) shall also initiate an emergency deactivation sequence. The circuit provides over-current protection and limits Icc to 150mA, maximum for self-protection. When an over-current condition is sensed, the circuit will invoke a de-activation sequence.

3.6 Activation and De-activation Sequence

The host controller is fully responsible for the activation sequencing of the smart card signals CLK, RST, I/O, AUX1 and AUX2. All these signals are held low by the 73S8009CN when the card is in the de-activated state. Upon card activation (the fall of $\overline{\text{CMDVCC}}$ ($\overline{3}$/$\overline{5}$)), all the signals are held low by the 73S8009CN until RDY goes high. The host should set the signals RSTIN, I/OUC, CLKIN, AUX1UC and AUX2UC low prior to activating the card and allow RDY to go high before transitioning any of these signals. In order to initiate activation, the card must be present and $\overline{\text{OFF}}$ must be high.

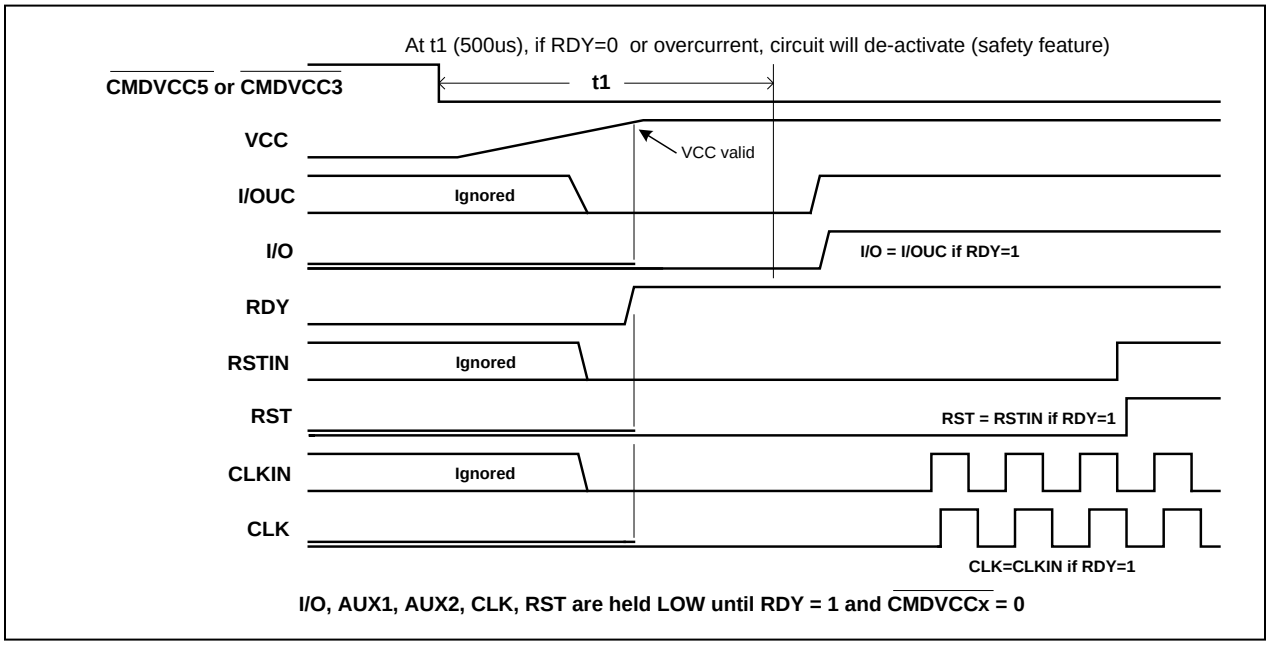

Figure 5: Activation Sequence

Deactivation is initiated either by the system controller by setting both $\overline{\text{CMDVCC}}$ ($\overline{3}$/$\overline{5}$) high, or automatically in the event of hardware faults or assertion of the OFF_ACK signal. Hardware faults are over-current, under-voltage, and card extraction during the session. The host can manage the I/O signals, CLKIN, RSTIN, and $\overline{\text{CMDVCC}}$ ($\overline{3}$/$\overline{5}$) to create other de-activation sequences for non-emergency situations.

The following steps show the deactivation sequence and the timing of the card control signals when the system controller sets the CMDVCC(x)B high:

1. RST goes low at the end of time t1.
2. De-assert CLK at the end of time t2.
3. I/O goes low at the end of time t3. Exit reception mode.
4. De-assert internal VCC_ON at the end of time t4. After a delay, VCC is de-asserted.

Note: Since the 73S8009CN does not control the waveshape of CLK (it is determined by the input form the host CLKIN), there is no guarantee that the duty cycle of the last CLK high pulse will conform to duty cycle requirements during an emergency deactivation.

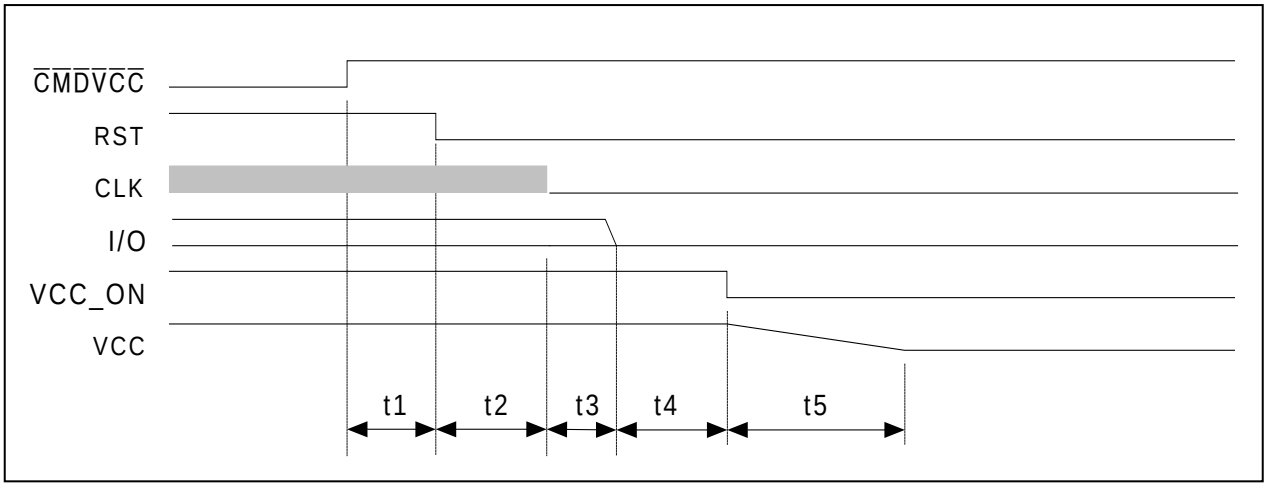

Figure 6: Deactivation Sequence

3.7 OFF and Fault Detection

There are two different cases that the system controller can monitor the OFF signal: to query regarding the card presence outside card sessions, or for fault detection during card sessions.

Outside a card session: In this condition, CMDVCC (3/5) are always high, OFF is low if the card is not present, and high if the card is present. Because it is outside a card session, no fault detection can occur and it will not act upon the OFF signal. No deactivation is required during this time.

During a card session: CMDVCC3 and/or CMDVCC5 is always low, and OFF falls low if the card is extracted or if any fault detection is detected. At the same time that OFF is set low, the sequencer starts the deactivation process and the host should stop all transitions on the signal lines.

Figure 4 shows the timing diagram for the signals CMDVCC (3/5), PRES, and OFF during a card session and outside the card session.

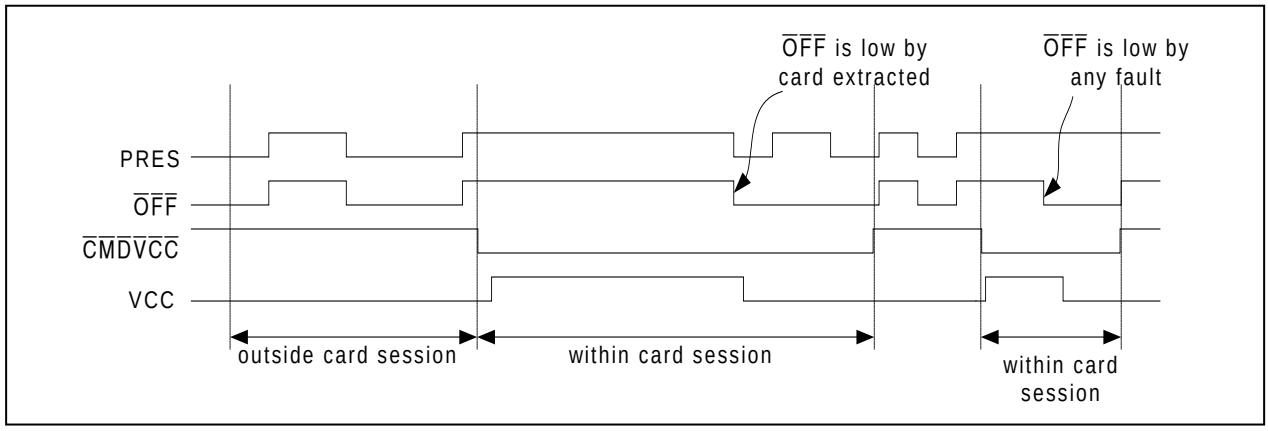

Figure 7: OFF Activity

3.8 Chip Selection

The CS pin allows multiple circuits to operate in parallel, driven from the same host control bus. When CS is high, the pins RSTIN, $\overline{\text{CMDVCC5}}$, $\overline{\text{CMDVCC3}}$ and CLKIN control the chip as described. The pins I/OUC, AUX1UC, and AUX2UC have 11kΩ pull-up resistors and operate to transfer data to the smart card via I/O, AUX1, and AUX2 when the smart card is activated. The signals $\overline{\text{OFF}}$ and RDY have 20kΩ pull-up resistors.

When CS goes low, the states of the pins RSTIN, $\overline{\text{CMDVCC5}}$, $\overline{\text{CMDVCC}}$, and CLKIN are latched and held internally. The pull-up for pins I/OUC, AUX1UC, and AUX2UC become a very weak pull-up of approximately 3 microamperes. No transfer of data is possible between I/OUC, AUX1UC, AUX2UC and the smart-card signals I/O, AUX1, and AUX2. The signals $\overline{\text{OFF}}$ and RDY are set to high impedance and the internal pull-up resistors of 20kΩ are disconnected. With regard to de-activation, CS does not affect the operation of the fault sensing circuits and card sense input. CS does not affect the action of SC/$\overline{\text{USB}}$.

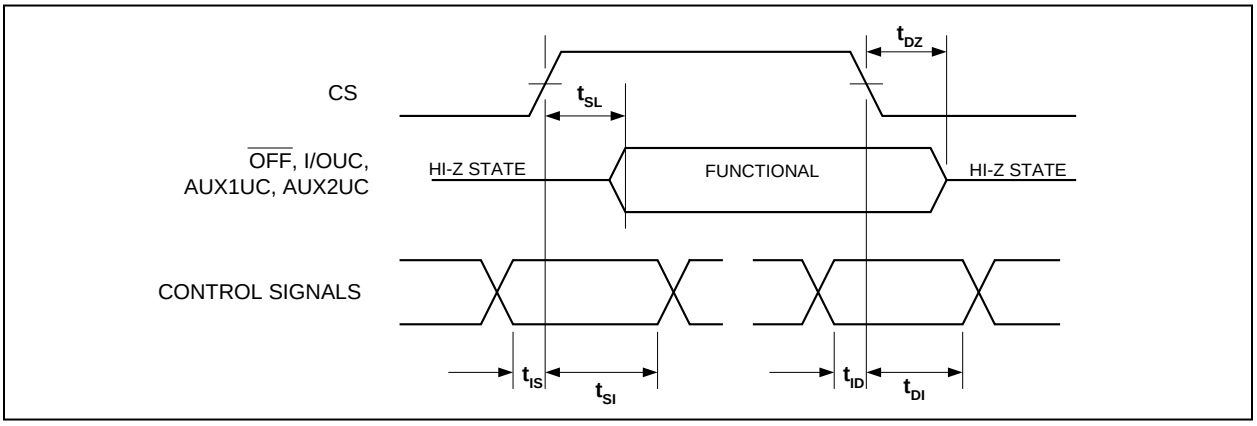

Figure 8: CS Timing Definitions

3.9 I/O Circuitry and Timing

The states of the I/O, AUX1, and AUX2 pins are low after power on reset and they are in high when the activation sequencer turns on the I/O reception state. See the Activation and De-activation Sequence section for more details on when the I/O reception is enabled. The states of I/OUC, AUX1UC, and AUX2UC are high after power on reset.

Within a card session and when the I/O reception state is turned on, the first I/O line on which a falling edge is detected becomes the input I/O line and the other becomes the output I/O line. When the input I/O line rising edge is detected, then both I/O lines return to their neutral state. Figure 6 shows the state diagram of how the I/O and I/OUC lines are managed to become input or output.

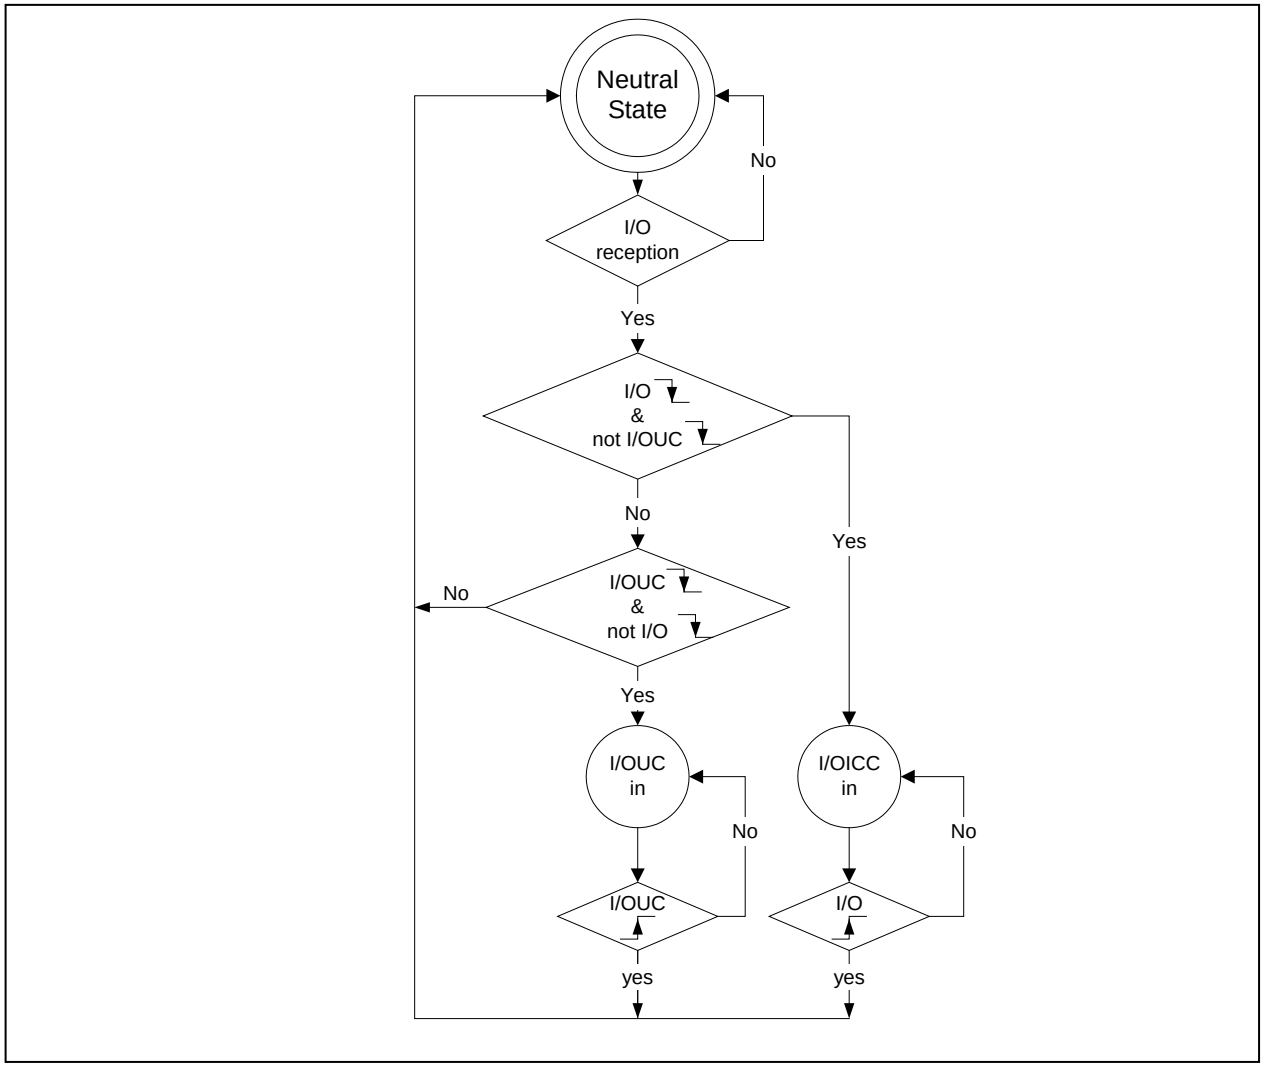

Figure 9: I/O and I/OUC State Diagram

The delay between the I/O signals is shown in Figure 10.

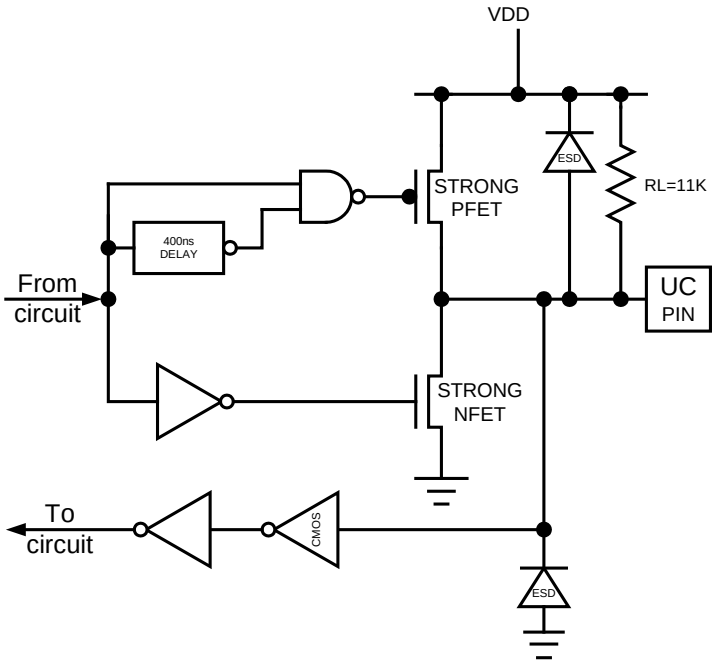

Figure 18: Smart Card IOUC, AUX1UC and AUX2UC Interface Circuit

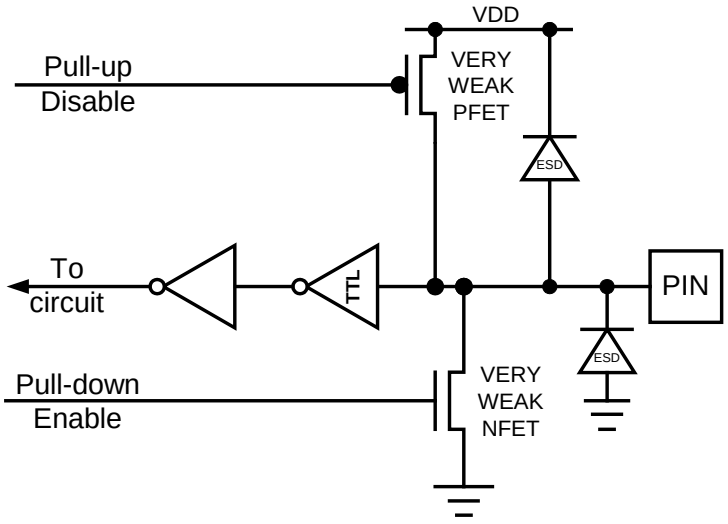
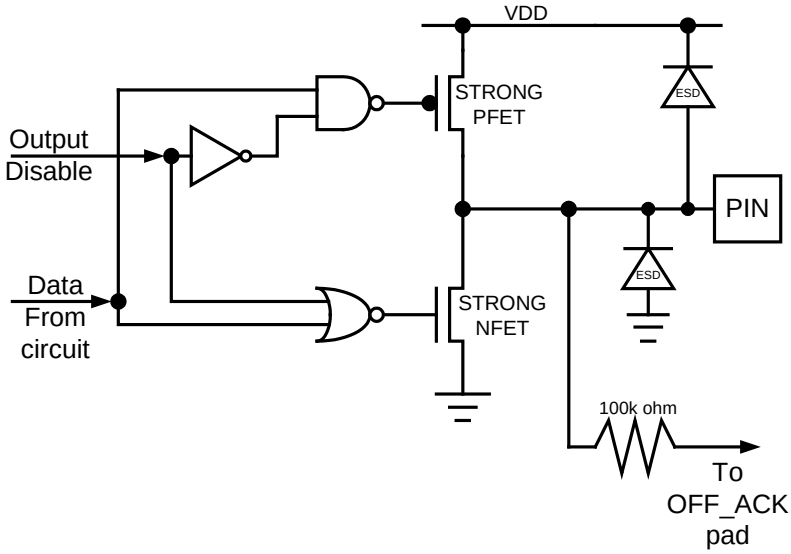


Note: Pins $\overline{\text{CMDVCC5}}$, $\overline{\text{CMDVCC3}}$, CS, SC/$\overline{\text{USB}}$ have the pull-up enabled.
Pins RSTIN, CLKIN, PRES, EXT_RST have the pull-down enabled.
Pin OFF_ACK has a 100kΩ resistor connected to pin OFF_REQ internally.

Figure 19: General Input Circuit



Notes: Strong PFET or NFET is approximately 100Ω
Very strong PFET or NFET is approximately 50Ω
Medium strength PFET is approximately 1kΩ
Very weak PFET or NFET is approximately 1MΩ
The diodes represent ESD protection devices that will conduct current if forward biased.

Revision History

Revision	Date	Description
1.0	10/23/2007	First publication.
1.1	11/6/2007	Added the Related Documentation section and the Contact Information section. Miscellaneous editorial changes. Change the name of the "$\overline{SC}$_$\overline{USB}$" pin to "SC/$\overline{USB}$".
1.2	1/21/2008	Changed the dimension of the bottom view 32-pin QFN package.
1.3	1/31/2008	Added Section 2.5, DC Characteristics.
1.4	8/28/2009	Corrected the document number from "DS_8009CN_001" to "DS_8009CN_026".
