General Description

The MAX14912/MAX14913 evaluation kit (EV kit) provides a proven design to evaluate the MAX14912 or MAX14913 octal digital output driver. The EV kit includes an evaluation board and a graphical user interface (GUI) that provides communication from a PC to the target device through a USB port.

The EV kit includes Windows 7, Windows 8 and Windows 10 compatible software for exercising the features of the IC. The EV kit GUI allows controlling the MAX14912/MAX14913 in either Parallel Mode or Serial (SPI) Mode.

The EV kit must be powered from an external +24V power supply and can consume up to 10A when fully loaded.

The MAX14912EVKIT/MAX14913EVKIT comes with a MAX14912AKN+, or MAX14913AKN+ installed in a 56-pin, 8 x 8mm TQFN-EP package.

Features

- Robust Operation with Wide Range of Input Voltages and Load Conditions
- SPI Interface with up to 20MHz Clock Rate
- Parallel Interface with up to 200kHz Switching Rate
- Manual Control in Parallel Mode
- Wide Logic Voltage Range
- -40°C to +125°C Temperature Range
- On-Board LED Indication of Status and Fault Conditions
- Daisy-Chain Capability
- Reverse-Voltage Protection
- Proven PCB Layout
- Fully Assembled and Tested
- Windows® 7, Windows 8 and Windows 10 Compatible Software

***Ordering Information* appears at end of data sheet.**

Quick Start

Required Equipment

- MAX14912/MAX14913 EV kit
- +24V power supply
- Voltmeter (optional)
- Oscilloscope (optional)
- PC with installed Windows 7, Windows 8 or Windows 10 and USB port

Note: In the following section(s), software-related items are identified by bolding. Text in bold refers to items directly from the EV system software. Text in **bold and underline** refers to items from the Windows operating system.

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation:

1) Visit **www.maximintegrated.com/evkitsoftware** to download the latest version of the EV kit software, MAX14912EVKIT.ZIP. Save the EV kit software to a temporary folder and uncompress the ZIP file.
2) Install the EV kit software on your computer by running the MAX14912EVKITSetupV1.0.exe program inside the temporary folder. The program files are copied to your PC and icons are created in the Windows **Start | Programs** menu.
3) Verify that all jumpers are in their default positions for the SPI or parallel mode operation (Table 1). Note that the hardware is configured for SPI communication by default.
4) Power up the EV kit with +24V from external power supply.
5) Start the EV kit software by opening its icon in the **Start | Programs** menu. The EV kit software appears as shown in Figure 1. Verify that the lower-right status bar indicates the EV kit hardware is **Connected**.The GUI automatically detects which EV kit is connected to the PC, the MAX14912 or MAX14913, and enables

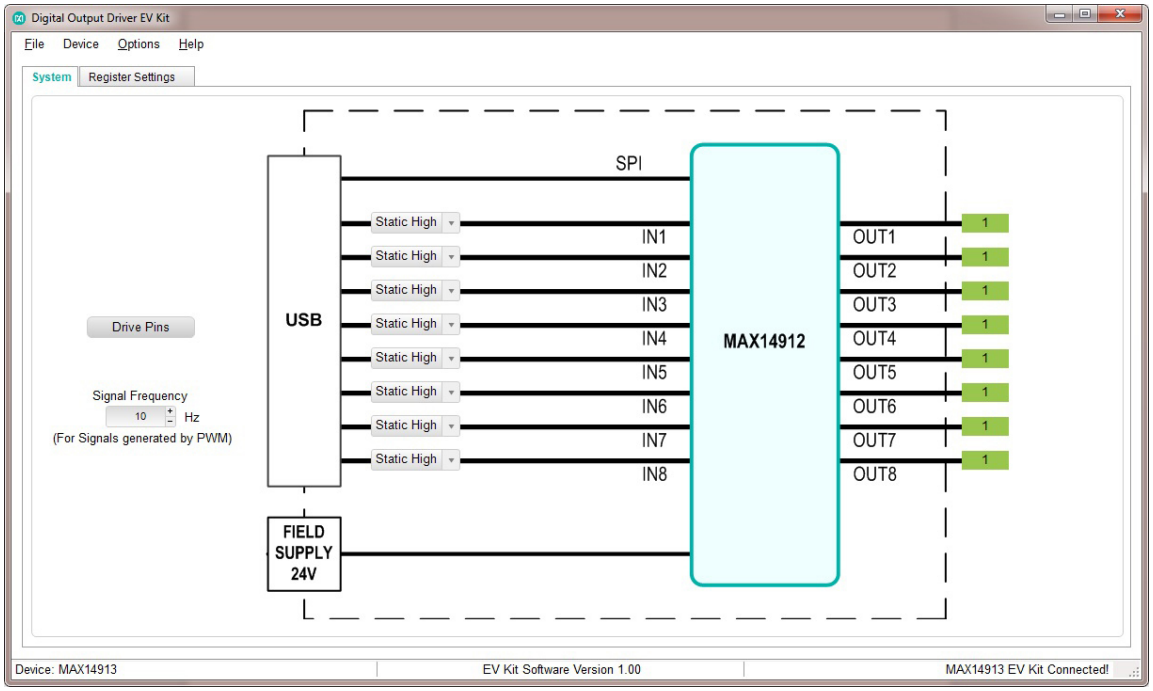

Figure 1. Digital Output Driver EV Kit GUI. System Tab

Table 1. MAX14912/MAX14913 Board Shunt Positions and Settings

HEADER	SHUNT POSITION	DESCIPTION
J3	Open*	Set IN8 high or low/select 16-bit or 8-bit SPI operation in GUI
	1-2	Set IN8 high and OUT8 on/high (stand-alone parallel mode)
	2-3	Set IN8 low and OUT8 off/low (stand-alone parallel mode)
J4	Open*	Set push-pull or high-side mode in GUI
	1-2	Set push-pull mode (stand-alone parallel mode)
	2-3	Set high-side mode (stand-alone parallel mode)
J5	Open*	Enable/disable outputs in GUI
	1-2	Enable outputs (stand-alone parallel mode)
	2-3	Disable (three-state) outputs (stand-alone parallel mode)
J6	Open*	Set IN2 high or low/enable command mode
	1-2	Set IN2 high and OUT2 on/high (stand-alone parallel mode)
	2-3	Set IN2 low and OUT2 off/low (stand-alone parallel mode)
J7	1-2*	Enable glitch filtering on all parallel logic inputs and $\overline{CS}$
	Open	Disable parallel logic glitch filtering
J8	Open*	Set IN7 high or low/Enable configuration command in GUI
	1-2	Set IN7 high and OUT7 on/high (stand-alone parallel mode)
	2-3	Set IN7 low and OUT7 off/low (stand-alone parallel mode)
J9	Open*	Select serial or parallel interface active in GUI
	1-2	Enable serial peripheral interface (SPI)
	2-3	Enable parallel interface (stand-alone parallel mode)
J10	Open*	Enable/disable open-load detection/Set IN1 in GUI
	1-2	Set IN1 high and OUT1 on/high (stand-alone parallel mode)
	2-3	Set IN1 low and OUT1 off/low (stand-alone parallel mode)
J11	Open*	Enable watchdog timer/set IN5 in GUI
	1-2	Set IN5 high and OUT5 on/high (stand-alone parallel mode)
	2-3	Set IN5 low and OUT5 off/low (stand-alone parallel mode)
J12	Open*	Enable or disable CRC detection/set IN3 in GUI
	1-2	Set IN3 high and OUT3 on/high (stand-alone parallel mode)
	2-3	Set IN3 low and OUT3 off/low (stand-alone parallel mode)
J13	1-2*	Select 3.3V logic level
	2-3	Select 5V logic level
J15	1-2*	5V supply. Replace J15 shunt with a current meter to measure power consumption.
J16	1-2*	Connect Status and Fault LED anodes for outputs 1 and 5 to the driver
	Open	Disconnect Status and Fault LED anodes for outputs 1 and 5 to the driver

Table 1. MAX14912/MAX14913 Board Shunt Positions and Settings (continued)

HEADER	SHUNT POSITION	DESCIPTION
J17	1-2*	Connect Status and Fault LED anodes for outputs 2 and 6 to the driver
	Open	Disconnect Status and Fault LED anodes for outputs 2 and 6 to the driver
J18	1-2*	Connect Status and Fault LED anodes for outputs 3 and 7 to the driver
	Open	Disconnect Status and Fault LED anodes for outputs 3 and 7 to the driver
J19	1-2*	Connect Status and Fault LED anodes for outputs 4 and 8 to the driver
	Open	Disconnect Status and Fault LED anodes for outputs 4 and 8 to the driver
J22	1-2	Select 5V power to U4 from USB port (CON1)
	2-3*	Select 5V power to U4 from integrated buck regulator (U1)
J26	1-2*	Disable daisy-chain communication
	2-3	Enable daisy-chaining of two boards and use GUI to send a command
JMP1	Open*	Enable CRC Error Detection output/Set IN4 high or low in GUI
	1-2	Set IN4 high and OUT4 on/high (stand-alone parallel mode)
	1-4	Set IN4 low and OUT4 off/low (stand-alone parallel mode)
	1-3	Connect CERR LED (DS1) to U1 to indicate communication error if CRC is enabled on J12
JMP2	Open*	Enable watchdog fault output/set IN6 high or low in GUI
	1-2	Set IN6 high and OUT6 on/high (stand-alone parallel mode)
	1-4	Set IN6 low and OUT6 off/low (stand-alone parallel mode)
	1-3	Connect WDFLT LED (DS2) to U1 to indicate communication error if Watchdog is enabled on J11
SW1	2-3, 5-6*	Enable buck regulator of U1 to generate 5V (ON position)
	1-2, 4-5	Disable buck regulator of U1. Provide an external +5V to TP1.

**Default configuration.*

serial command mode communication. Any configuration change can be made on Register Settings tab. (The following steps are used to verify functionality of the devices.)

6) Select **System** tab.
7) Configure each input signal as **Static High** from the pull-down menu, as shown in Figure 1.
8) Click on **Drive Pins** button on the left-side of the GUI.
9) Observe all the status LEDs (DS5 to DS12) light up, and measured output voltages on corresponding OUT_ test point match V_{DD} level.
10) Change the input signal to **Static Low** from the pulldown menu and observe as corresponding LED turned off.
11) Change the input signal to **Static PWM**. Select the duty cycle from the pulldown menu, refer to Figure 2, and observe the output on corresponding OUT_ test point by oscilloscope.

General Description of Software

When the GUI starts, it automatically detects which device is connected to the PC and indicates that in the status bar at the bottom-edge of the GUI. There are two tabs available to control the EV kit. The **System** tab provides system-level control of the selected output pins, including static or dynamic PWM (Pulse-Width Modulation) output in either serial or parallel Mode. The **Register Settings** tab provides full control of the device, including mode selection, per-channel configuration, and enhanced diagnostics of the device. In Serial mode, the SPI clock is set to 5MHz.

System Tab

The **System** tab allows driving the output pins by setting up the input signal to the device through the on-board USB to SPI/GPIO bridge IC, U4. Each input pin can be configured as Static High, Static Low, Static PWM, or PWM from the pulldown menu on the input lines in the block diagram shown in the **System** tab. Refer to Figure 3.

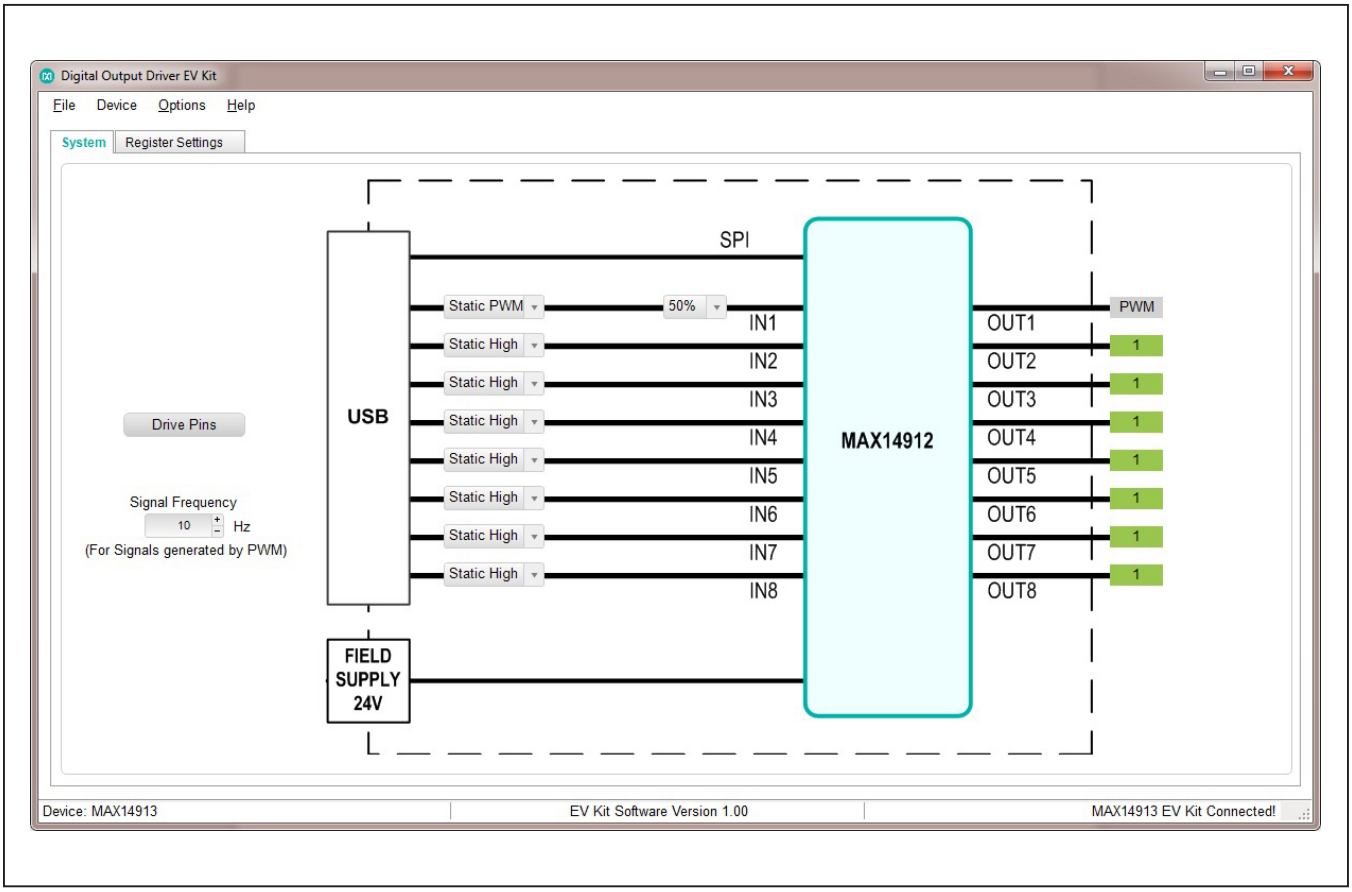

Figure 2. System Tab. Static PWM Configuration

Click **Drive Pins** button on the left-side of the GUI after configuring the inputs. The outputs follow the state of the inputs, while indicators connected to the OUT_ pins show the static state or dynamic operation mode.

Connect the oscilloscope probe to OUT_ pin to see the output signal in real-time.

In static PWM and PWM mode, the GUI generates a 1kHz (if SRIAL pin is high) or 20kHz (if SRIAL pin is low) square wave. The level of modulation is selectable from the pulldown menu from 0% to 100%. Refer to Figure 2.

In PWM mode, the signal is modulated by a selected waveform. It can be either a sine wave with a selectable phase, triangle, or sawtooth wave. Refer to Figure 3. The modulation frequency is adjustable from 0Hz up to 60Hz by pressing the **+** or **-** buttons. This feature is useful to control small motors, including 3-phase motors, and actuators.

Register Settings Tab

The **Register Settings** tab is used for detailed configuration of the device to explore all the available features in either parallel (SRIAL is low) or serial (SPI) mode (SRIAL is high). SPI communication is also available in parallel mode with the MAX14912. For a detailed explanation of the features, refer to the MAX14912/MAX14913 data sheet. The mode and pin configuration can be set through the MAX14912 I/O pins control group box on the right-side of the tab. Refer to Figure 4. The pin set slide buttons allow the setting of the input pins high or low, while the read status boxes provide visual colored states of the input/output pins.

The EV kit supports a number of different devices, as listed in Table 3.

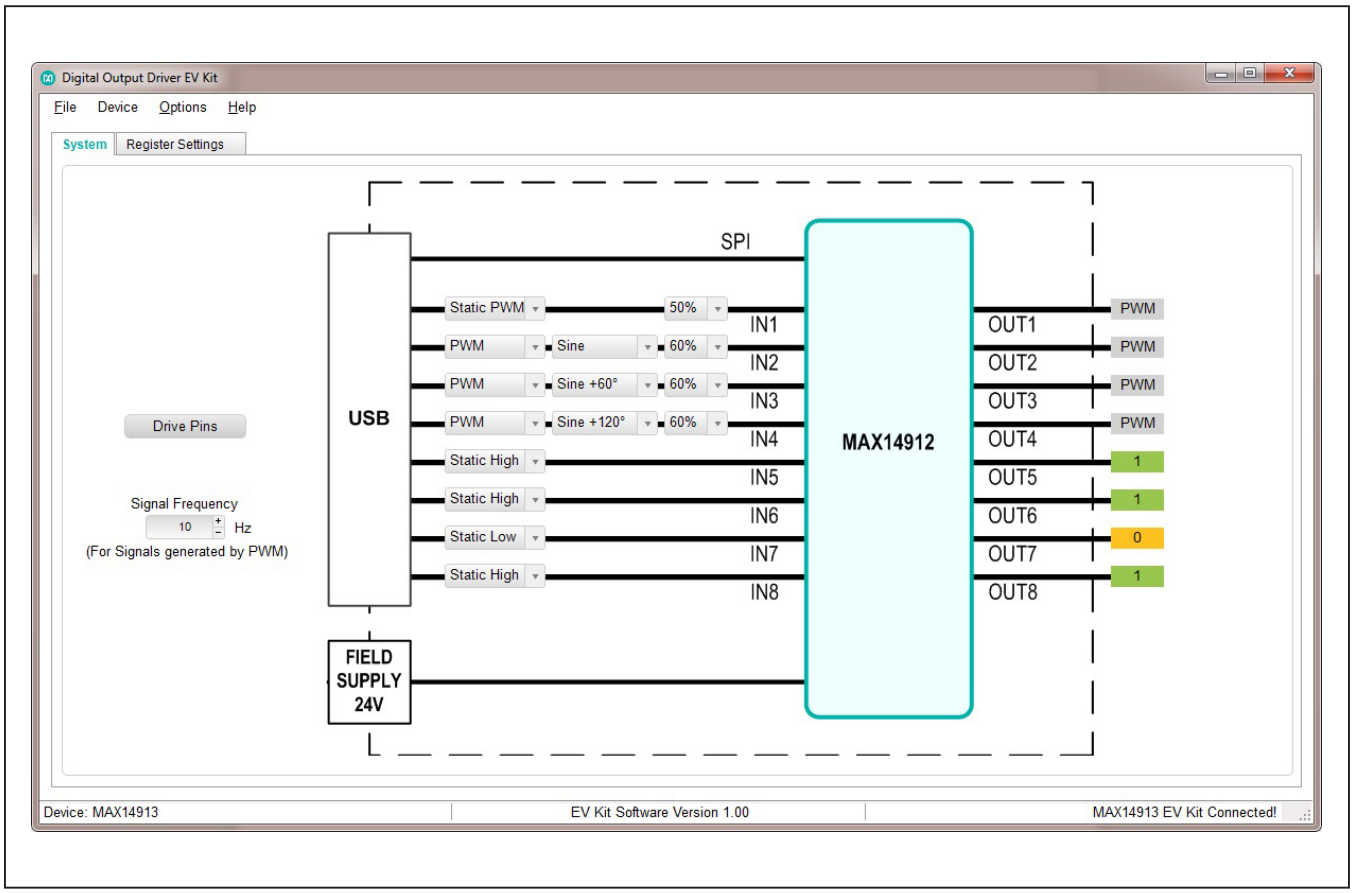

Figure 3. System Tab. PWM Configuration

User-Supplied SPI

To evaluate the EV kit with a user-supplied SPI bus, disconnect the board from the PC. Apply the user-supplied CS, SCLK (CLK), MOSI (SDI) and MISO (SDO) to the J25 header. Make sure the master ground is connected to the J25.5 ground pin.

The logic level of the external SPI host should be compatible with the J13 shunt selection, (e.g., 3.3V or 5V). Use an external VL logic supply to TP19 to support different logic levels from 1.6V to 5.5V. In this case, J13 shunt should be removed.

Daisy-Chaining

The two MAX1491X EV kits can be daisy-chained by pairing J24 of board #2 and J23 of board #1 in order to control 16 outputs through a single SPI host. The J26 jumper of board #1 must be set to 2-3 position and both boards have to be powered from an external +24V. The PC should be connected to board #1.

It is also required that board #2 has installed jumpers for SPI communication: J9: 1-2, J5: 1-2, J6: 1-2, J12: 2-3, and J11: 2-3.

The daisy-chain feature is not supported by rev 1.0 GUI and can be evaluated using user-supplied SPI interface. Refer to the MAX14912/MAX14913 data sheet for daisy-chain command description.

External +5V Power Supply

An external +5V voltage can supply to TP1, +5V_EXT. In this case the internal dc-dc controller should be disabled (BUKEN = low) by switching SW1 into off position.

Reverse-Voltage Protection

The EV kit has reverse-voltage protection circuitry built on the return path of the supply current. During normal operation, the Q1 nMOSFET is ON since the gate voltage is about 7.5V higher than the source. Very low R_{ON} of Q1 MOSFET helps to minimize voltage drop and power dissipation to a negligible level. If V_{DD} becomes negative with respect to the supply ground, the MOSFET is turned off and disconnects the current path.

Stand-Alone Operation

The EV kit can work without connecting to a PC. In this case, jumpers should set the inputs, refer to Table 1 for proper shunt positions. In stand-alone operation, the devices should be configured for parallel mode. It is recommended to enable internal de-bouncing by placing the J7 shunt for proper operation.

This EV kit comes with two assembly options:

The MAX14912EVKIT# comes with a MAX14912ATE+ in a 56-pin TQFN package.

The MAX14913EVKIT# comes with a MAX14913ATE+ in a 56-pin TQFN package.

Both EV Kit variations use the same PCB and bill of materials, and the only variation is the IC assembled at U1.

Table 3. Products supported with MAX14912/MAX14913 EV kit

PART #	DESCRIPTION
MAX14912	Octal High-Speed Output Driver
MAX14913	Octal High-Speed Output Driver

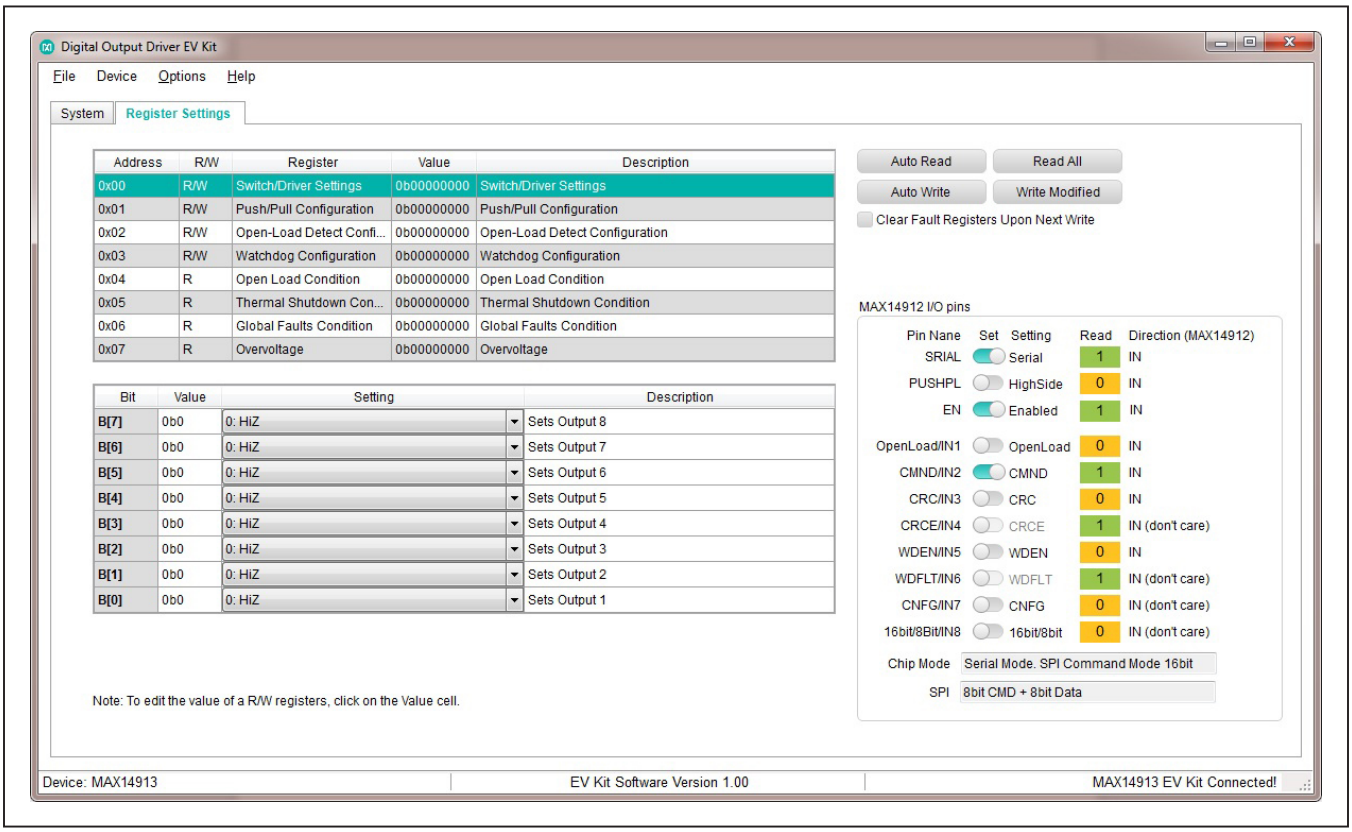

Figure 4. Digital Output Driver EV Kit GUI. Register Settings Tab

The two tables on the left side of the tab are the register map (upper table) and bit-by-bit control and description table (lower table). When the register is selected in upper table, the lower table gives the description of each bit and allows changing the register settings using drop down menus for writable registers 0x00 to 0x03. The register setting can be changed directly in the register map table by double clicking on the Value cell. Each data entry should follow by the "Enter/Return" button on the keyboard. The Value cell accepts binary (0b), decimal or hex (0x) numbers and automatically convert them into binary format. The modified register changes its color from black to red until the data will be actually written to the register. There are several write and read options available through the corresponding control buttons on the upper right side of the GUI.

*When the **Auto Write** button is selected, any data typed in, or selected through, the **Setting** pulldown menu will be automatically written into the corresponding writable register. The button renamed to **Stop Auto Write** and auto write function can be canceled by clicking on this button second time.*

*When the **Auto Read** button is selected, the write function is disabled and the GUI is constantly monitoring the status and fault conditions of the device. Clicking a second time on the button, which becomes **Stop Auto Read**, allows canceling this operation.*

*The **Read All** button performs a read operation of all registers after each click.*

*When any fault conditions occur, they will set the bit(s) in the corresponding read-only registers 0x04 to 0x07. The fault conditions should be carefully evaluated and removed externally (overvoltage/under voltage, overload, open load, etc.). After that, select the **Clear Fault Registers Upon Next Write** check box and perform any write/read operation to clear fault bits.*

*The **Write Modified** button performs write operation to all modified registers after each click.*
