

MAX17222 Evaluation Kit

Evaluates: MAX17220–MAX17225

General Description

The MAX17222 evaluation kit (EV kit) evaluates the MAX17220–MAX17225 IC family of ultra-low quiescent current step-up DC-DC converters. The MAX17222 EV kit features two independent circuits to evaluate two different IC packages of the MAX17220–MAX17225 family. Both circuits on the EV kit operate over an input range of 400mV to 5.5V, depending on load, with 0.88V typical startup with 3k Ω load. Each circuit provides resistor-configurable output voltages from 1.8V to 5V in 100mV/step.

The EV kit comes with the MAX17222ELT+ and MAX17222ENT+ installed.

Features

- Two Independent Circuits on One Board
 - Evaluates the MAX17220–MAX17225 IC Family in a 6-pin μ DFN
 - Evaluates the MAX17220–MAX17225 IC Family in a 6-pin Wafer-Level Package (WLP)
- 400mV to 5.5V Input Range
- 1.8V to 5V Configurable Output Voltage in 100mV/step
- Up to 100mA/225mA/425mA Output Current
- Proven 2-Layer 1oz Copper PCB Layout
- Demonstrates Compact Solution Size
- Fully Assemble and Tested

Quick Start

Required Equipment

- MAX17222 EV kit
- 1.8V to 5V, 3A DC power supply
- Electronic load capable of 225mA
- Digital voltmeter (DVM)

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation.

Caution: Do not turn on power supply until all connections are completed.

Testing the 3V Output Circuit

- 1) Verify that jumper JU101 is in its default position, as shown in [Table 2](#).
- 2) Connect the power supply between the IN and nearest GND terminal posts.
- 3) Connect the electronic load between the 3V output and nearest GND terminal posts.
- 4) Connect the DVM between the 3V output and nearest GND terminal posts.
- 5) Set the input power supply to 1.8V and turn on the power supply.
- 6) Set the electronic load to 225mA and enable the electronic load.
- 7) Verify that the voltage at the 3V terminal post is approximately 3V.

Testing the 5V Output Circuit

- 1) Verify that jumper JU1 is in its default position, as shown in [Table 1](#).
- 2) Connect the power supply between the IN1 and nearest GND1 terminal posts.
- 3) Connect the electronic load between the 5V output and nearest GND1 terminal posts.
- 4) Connect the DVM between the 5V output and a nearest GND1 terminal posts.
- 5) Set the input power supply to 3V, and turn on the power supply.
- 6) Set the electronic load to 225mA, and enable the electronic load.
- 7) Verify that the voltage at the 5V terminal post is approximately 5V.

Detailed Description of Hardware

The MAX17222 EV kit evaluates the MAX17220–MAX17225 IC family of ultra-low quiescent current step-up DC-DC converters. The MAX17222 EV kit features two independent circuits to evaluate two different IC packages of the MAX17220–MAX17225 family. Both circuits on the EV kit operate over an input range of 400mV to 5.5V. Each circuit provides resistor-configurable output voltages from 1.8V to 5V in 100mV/step.

The MAX17222 EV Kit comes with a MAX17222ELT+ (µDFN) and a MAX17222ENT+ (WLP) installed. The MAX17222ELT+ circuit is configured for a 3V output, and can deliver 225mA with 1.8V input. The MAX17222ENT+ circuit is configured for a 5V output, and can deliver 225mA with 3V input.

EN for the WLP Circuit

The WLP circuit on the EV kit provides a jumper (JU1) to enable or disable the MAX17222ENT+. Refer to [Table 1](#) for JU1 jumper settings.

EN for the µDFN Circuit

The µDFN circuit on the EV kit provides a jumper (JU101) to enable/disable the MAX17222ELT+. Refer to [Table 2](#) for JU101 jumper settings.

Battery Holders

The MAX17222 EV kit provides battery holders for each of the two circuits. The battery holder V1 can accommodate a CR1632 Lithium Coin cell to power the WLP circuit, while the V101 can hold an Energizer 364/363 silver oxide cell to power the µDFN circuit.

Table 1. EN on MAX17222ENT+ (JU1)

JU1 SHUNT POSITION	DESCRIPTION
1-2*	Enabled. EN = IN1 (through pullup resistor R2)
2-3	Disabled. EN = GND1
Not Installed	Enabled. EN = high (through internal pullup resistor)

*Default position.

Spare Resistors and Inductors

The EV kit provides spare resistors and inductors on the PCB's bottom side. The spare resistors can be used to reconfigure the EV kit to a different output voltage (2V, 2.5V, 3V, or 3.3V). The spare inductors can be used to reconfigure the EV Kit output current ratings.

Table 2. EN on MAX17222ELT+ (JU101)

JU101 SHUNT POSITION	DESCRIPTION
1-2*	Enabled. EN = IN (through pullup resistor R102)
2-3	Disabled. EN = GND
Not Installed	Enabled. EN = high (through internal pullup resistor)

*Default position.

Evaluating Other ICs

The MAX17222 EV kit can also evaluate other ICs in the MAX17220–MAX17225 IC family. To evaluate the other ICs, replace U1 and/or U101 with the desired IC/IC package. Refer to the MAX17220–MAX17225 IC data sheet for additional information.
