Quick Start

Recommended Equipment

- One 15V - 60V DC, 1A Power Supply
- One resistive load 750mA sink capacity
- Two Digital Multimeters (DMM)

Caution: Do not turn on the power supply until all connections are completed.

Procedure

The EV kit comes with the default secondary output programmed to +12V.

- 1) Verify that J1 is open
- 2) Set the power supply output to 24V. Disable the power supply
- 3) Connect the positive terminal of the power supply to the VIN PCB pad and the negative terminal to the nearest PGND PCB pad. Connect a 750mA resistive load across the +12V PCB pad and the GND0 PCB pad.
- 4) Connect a DMM configured in voltmeter mode across the +12V PCB pad and the nearest GND0 PCB pad.
- 5) Enable the input power supply.
- 6) Verify that output voltage is at +12V (with allowable tolerance of 10%) with respect to GND0.
- 7) If required, vary the input voltage from 16V to 42V, and the load current from 0mA to 750mA and verify that output voltage is at +12V (with allowable tolerance of 10%).

Detailed Description

The MAX17682EVKITA evaluation kit (EV kit) is a fully assembled and tested circuit board that demonstrates the performance of the MAX17682 high-efficiency, iso-buck, DC-DC converter designed to provide an isolated power up to 10W. The EV kit generates +12V, 750mA voltages from a 16V to 42V input supply. The EV kit features a forced-PWM control scheme that provides constant switching-frequency of 200 kHz operation at all load and line conditions.

The EV Kit includes an EN/UVLO PCB pad to monitor and program the EN/UVLO pin of the MAX17682. The VPRI PCB pad helps measure the regulated primary output voltage (V_{PRI}). An additional RESETB PCB pad is available for monitoring the health of primary output voltage (V_{PRI}). RESETB pulls low if FB voltage drops below 92%(typ) of its set value and RESETB goes high impedance 1024 clock cycles after FB voltage rises above 95% of its set value. The programmable soft-start feature allows users to reduce the input inrush current.

The iso-buck is a synchronous-buck-converter-based topology, useful for generating isolated outputs at low power level without using an opto-coupler. The detailed procedure for setting the soft-start time, ENABLE/UVLO divider, primary output voltage (V_{PRI}) selection, adjusting the primary output voltage, primary inductance selection, turns-ratio selection, output capacitor selection, output diode selection and external loop compensation are given in MAX17682 IC data sheet.

Enable Control (J1)

The EN/UVLO pin on the device serves as an on/off control while also allowing the user to program the input undervoltage lockout (UVLO) threshold. Jumper J1 configures the EV kit's output for turn-on/turn-off control. Install a shunt across jumper J1 pins 2-3 to disable VOUT. See [Table 1](#) for proper J1 jumper configurations.

Table 1. Enable Control (EN/UVLO) (J1) Jumper Settings

SHUNT POSITION	EN/UVLO PIN	V _{OUT} OUTPUT
J1		
1-2	Connected to V _{IN}	Always Enabled
2-3	Connected to GND	Always Disabled
Open*	Connected to midpoint of R1, R2 resistor-divider	Enabled at V _{IN} ≥ 15V

*Default position.

Note 1: The secondary output diodes D1 is rated to carry short-circuit current only for few hundredths of a millisecond and is not rated to carry the continuous short-circuit current.

Note 2: The iso-buck converter typically needs 10% minimum load to regulate the output voltage. In this design when the +12V rail is healthy, U2 sinks the minimum load current required to regulate the output voltages within ±10% regulation.
