

MAX20019/MAX20020 Evaluation Kits

Evaluate: MAX20019/MAX20020

General Description

The MAX20019/MAX20020 evaluation kits (EV kits) are fully assembled and tested PCBs that demonstrate the MAX20019 and MAX20020 dual step-down converters with integrated high-side and low-side MOSFETs.

The EV kits provide a high-efficiency power-conversion solution and generate low output voltage from the dual step-down converters: OUT1 steps down up to 16V high input to 3.3V to provide the power to OUT2, while OUT2 steps down the OUT1 voltage to 1.8V. The 3.2MHz switching-frequency operation allows for the use of all-ceramic capacitors and minimizes external components. The EV kits feature on/off jumper controls to enable/disable OUT1 and OUT2.

Features

- 3.5V to 16V Operating Supply Voltage
- 5V, 3.3V, 3.0V, and 2.8V Options at 500mA Synchronous Step-Down Converter (OUT1)
- 1.8V, 1.5V, 1.2V, and 1V Options at 500mA Synchronous Step-Down Converter (OUT2)
- 3.2MHz Operation Minimizes System Solution Size
- Minimized External Components
- Proven PCB Layout
- Fully Assembled and Tested

Ordering Information appears at end of data sheet.

Quick Start

Required Equipment

- MAX20019 or MAX20020 EV kit
- Variable 25V power supply capable of supplying 2A
- Electronic load
- Two voltmeters

Procedure

The EV kits are fully assembled and tested. Follow the steps below to verify board operation. **Caution: Do not turn on the power supply until all connections are completed.**

- 1) Preset the power supply to 8V. Turn off the power supply.
- 2) Preset the electronic load to 300mA. Turn off the electronic load.
- 3) Connect the positive lead of the power supply to the VSUP PCB pad. Connect the negative lead of the power supply to the PGND PCB pad.
- 4) Connect the positive terminal of the electronic load to the VOUT2 PCB pad. Connect the negative terminal of the electronic load to the PGND2 PCB pad.
- 5) Enable outputs VOUT1 and VOUT2 by installing the shunt on jumper JU1.
- 6) Turn on the power supply.
- 7) Verify that the voltage across the VOUT1 and PGND1 PCB pads is 3.3V.
- 8) Verify that the voltage across the VOUT2 and PGND2 PCB pads is 1.8V.
- 9) Turn on the electronic load.
- 10) Verify that the voltage across the VOUT1 and PGND1 PCB pads is 3.3V \pm 3%.
- 11) Verify that the voltage across the VOUT2 and PGND2 PCB pads is 1.8V \pm 3%.
- 12) Turn off the electronic load.
- 13) Turn off the power supply.

Detailed Description

The MAX20019/MAX20020 EV kits integrate dual high-efficiency DC-DC step-down converters. OUT1 steps down a high input voltage to 3.3V at up to 500mA, while OUT2 steps down OUT1 voltage to 1.8V. VOUT1 and VOUT2 can be enabled/disabled by JU1 jumper.

Enable Control (JU1)

The JU1 jumper is used to enable or disable VOUT1 and VOUT2. Install a shunt on JU1 to enable VOUT1 and VOUT2 normal operation. Remove shunts on JU1 to enter shutdown mode. See [Table 1](#) for enable control.

Table 1. Enable Control (JU1)

SHUNT POSITION	MODE
On	Normal Operation
Off	Shutdown
