## Automotive Quad, Low-Voltage Step-Down DC-DC Converters

## Benefits and Features

- Quad Step-Down DC-DC Converters with Integrated FETs
- Operate from 3.0V to 5.5V Supply Voltage
- 1.0 V to 4.0 V Fixed or Adjustable Output Voltage
- 2.2 MHz (MAX20022) or 3.2 MHz (MAX20021) Switching Frequency
- Four Channels Capable of Delivering Up to 1A Each
- Designed to Improve Automotive EMI Performance
- Forced-PWM Operation
- Two Channels $180^{\circ}$ Out-of-Phase
- SYNC Input
- Spread-Spectrum Option
- Soft-Start and Supply Sequencing Reduces Inrush Current
- Individual Enable Inputs and Power-Good Outputs to Simplify Sequencing
- OV/UV Input-Voltage Monitoring
- Overtemperature and Short-Circuit Protection
- 28-Pin ( $5 \mathrm{~mm} \times 5 \mathrm{~mm} \times 0.8 \mathrm{~mm}$ ) TQFN-EP Package
- $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ Operating Temperature Range

Pin Configuration

## Pin Description

| PIN | NAME |  |
| :---: | :---: | :--- |
| 1 | EN1 | Active-High Digital Enable Input for Buck 1. Driving EN1 high enables Buck 1. |
| 2 | PV1 | Buck 1 Voltage Input. Connect a 2.2 $\mu$ F or larger ceramic capacitor from PV1 to PGND1 as close <br> as possible to the device. |
| 3 | LX1 | Buck 1 Switching Node. LX1 is high impedance when the device is off. |
| 4 | PGND1 | Power Ground for Buck 1 |
| 5 | PGND2 | Power Ground for Buck 2 |
| 6 | LX2 | Buck 2 Switching Node. LX2 is high impedance when the device is off. |
| 7 | PV2 | Buck 2 Voltage Input. Connect a 2.2 $\mu$ F or larger ceramic capacitor from PV2 to PGND2 as close <br> as possible to the device. |
| 8 | OUTS2 | Buck 2 Voltage Sense Input |
| 10 | EN2 | Active-High Digital Enable Input for Buck 2. Driving EN2 high enables Buck 2. |
| 11 | PG2 | Open-Drain, Active-High, Power-Good Output for Buck 2. To obtain a logic signal, pull up PG2 <br> with an external resistor connected to a positive voltage equal to or lower than V. |
| 12 | PG3 | Buck 3 Output-Voltage Select Input. Connect SEL to PGND_for a 1.8V output. Connect SEL to <br> PV_ for a 2.65V output. Do not toggle during normal operation. |
| 13 | EN3 | Open-Drain, Active-High, Power-Good Output for Buck 3. To obtain a logic signal, pull up PG3 <br> with an external resistor connected to a positive voltage equal to or lower than $V_{\text {A. }}$ |
| 14 | OUTS3 | Buck 3 Voltage Sense Input |

## Pin Description (continued)

| PIN | NAME | FUNCTION |
| :---: | :---: | :---: |
| 15 | PV3 | Buck 3 Voltage Input. Connect a $2.2 \mu \mathrm{~F}$ or larger ceramic capacitor from PV3 to PGND3 as close as possible to the device. |
| 16 | LX3 | Buck 3 Switching Node. LX3 is high impedance when the device is off. |
| 17 | PGND3 | Power Ground for Buck 3 |
| 18 | PGND4 | Power Ground for Buck 4 |
| 19 | LX4 | Buck 4 Switching Node. LX4 is high impedance when the device is off. |
| 20 | PV4 | Buck 4 Voltage Input. Connect a $2.2 \mu \mathrm{~F}$ or larger ceramic capacitor from PV4 to PGND4 as close as possible to the device. |
| 21 | EN4 | Active-High Digital Enable Input for Buck 4. Driving EN4 high enables Buck 4. |
| 22 | OUTS4 | Buck 4 Voltage Sense Input |
| 23 | PG4 | Open-Drain, Active-High, Power-Good Output for Buck 4. To obtain a logic signal, pull up PG4 with an external resistor connected to a positive voltage equal to or lower than $\mathrm{V}_{\mathrm{A}}$. |
| 24 | GND | Analog Ground |
| 25 | SYNC | SYNC Input. Supply an external clock to control the switching frequency. Connect SYNC to PGND_ to use the default switching frequency. |
| 26 | $\mathrm{V}_{\text {A }}$ | Analog Voltage Supply. Connect a $1 \mu \mathrm{~F}$ or larger ceramic capacitor from $\mathrm{V}_{\mathrm{A}}$ to GND as close as possible to the device. Connect to the same supply as PV_ inputs. |
| 27 | PG1 | Open-Drain, Active-High, Power-Good Output for Buck 1. To obtain a logic signal, pull up PG1 with an external resistor connected to a positive voltage equal to or lower than $\mathrm{V}_{\mathrm{A}}$. |
| 28 | OUTS1 | Buck 1 Voltage Sense Input |
| - | EP | Exposed Pad. Connect the exposed pad to ground. Connecting the exposed pad to ground does not remove the requirement for proper ground connections to PGND1-PGND4 and GND. The exposed pad is attached with epoxy to the substrate of the die, making it an excellent path to remove heat from the IC. |

Figure 1. Internal Block Diagram

## Detailed Description

The MAX20021/MAX20022 PMICs offer four, highefficiency, synchronous step-down converters that operate with a 3.0 V to 5.5 V input voltage range and provide a 1.0 V to 4.0 V output voltage range. The PMICs deliver up to 1.0A of load current per output. The PMICs achieve $\pm 3 \%$ output error over load, line, and temperature ranges.
The PMICs feature fixed-frequency PWM-mode operation with a 2.2 MHz or 3.2 MHz switching frequency. An optional spread-spectrum frequency modulation minimizes radiated electromagnetic emissions due to the switching frequency, while a factory-programmable synchronization input (SYNC) allows the device to synchronize to an external clock.
Integrated low RDSON switches help minimize efficiency losses at heavy loads and reduce critical/parasitic inductance, making the layout a much simpler task with respect to discrete solutions.

The PMICs are offered in factory-preset output voltages to allow customers to achieve $\pm 3 \%$ output-voltage accuracy, without using expensive $0.1 \%$ resistors. In addition, adjustable output-voltage versions can be set to any desired values between 1.0 V and 4.0 V using an external resistive divider. See the Selector Guide for available options.
Additionally, each converter features soft-start, PG_ output, overcurrent, and overtemperature protections (see Figure 1).

## Control Scheme

The PMICs use peak current-mode control. The devices feature internal slope compensation and internal loop compensation, both of which reduce board space and allow a very compact solution.

## Hybrid Load-Line Architecture

The PMICs feature hybrid load-line architecture to reduce the output capacitance needed, potentially saving system cost and size. This results in a measurable load transient response.

## Input Overvoltage Monitoring (OV)

The PMICs feature an input overvoltage-monitoring circuit on the input supply. When the input exceeds 5.8 V (typ) all power-good indicators (PG_) go low. When the input supply returns to within the operating range of 5.7 V (typ) or less during the timeout period, the power-good indicators go high.

## Input Undervoltage Monitoring (UVM)

The MAX20021 features an input undervoltage monitoring circuit on the input supply. When the input drops below
4.3V (typ), all power-good indicators (PG_) go low to indicate a potential brownout condition. The device remains operational down to the UVLO threshold. When the input voltage exceeds the UV threshold above 4.4 V (typ), PG_ remains low for the factory-trimmed "active timeout period." UVM is a factory-selectable option.

## Input Undervoltage Lockout (UVLO)

The PMICs feature an undervoltage lockout on the PV_ inputs set at 2.77 V (typ) falling. This prevents loss of control of the device by shutting down all outputs. This circuit is only active when at least one buck converter is enabled.

## Power-Good Outputs (PG_)

The PMICs feature an open-drain power-good output for each of the four buck regulators. PG_ asserts low when the output voltage drops $6 \%$ below the regulated voltage or $10 \%$ above the regulated voltage for approximately $15 \mu \mathrm{~s}$. PG_remains asserted for a fixed 20,480 switching cycles after the output returns to its regulated voltage. PG_ asserts low during soft-start and in shutdown. PG_ becomes high impedance when Buck_ is in regulation. Connect PG_ to a logic supply with a $10 \mathrm{k} \Omega$ resistor.

## Soft-Start

The PMICs include a 3272 switching cycle fixed-duration soft-start time. The soft-start time limits startup inrush current by forcing the output voltage to ramp up towards its regulation point. During soft-start, the converters operate in skip mode to prevent the outputs from discharging.
When the PMICs exit UVLO or thermal shutdown, there is a fixed blanking time for EN2-EN4 to prevent all four outputs from going through soft-start at the same time. After 24,576 switching cycles with UVLO high and at least one buck converter enabled, there is no blanking time between EN2-EN4 high and the start of soft-start.

Figure 2. Load Transient Response

## Output 3 Voltage Select (SEL)

The MAX20021 offers a SEL input to allow selection of the OUT3 voltage. For fixed output versions, connect SEL to PGND_ for a 1.8 V output or to PV _ for a 2.65 V output. There is no soft transition between the two output-voltage settings, so SEL should not be toggled during normal operation. For the MAX20022, connect SEL to PGND_ or leave unconnected.

## Spread-Spectrum Option

The PMICs feature a linear spread-spectrum (SS) operation, which varies the internal operating frequency between $\mathrm{f}_{\text {SW }}$ and ( $\mathrm{f}_{S W}+3 \%$ ). The internal oscillator is frequency modulated at a rate of 1.5 kHz with a frequency deviation of $3 \%$ (see Figure 4). This function does not apply to an oscillation frequency applied externally through the SYNC pin. Spread spectrum is a factory-selectable option. See the Selector Guide for available options.

## Synchronization (SYNC)

The PMICs feature a SYNC input to allow the internal oscillator to synchronize with an external clock. SYNC accepts signal frequencies in the range of $1.7 \mathrm{MHz}<$ $\mathrm{f}_{\text {SYNC }}<2.5 \mathrm{MHz}\left(2.2 \mathrm{MHz}\right.$ option), or $2.7 \mathrm{MHz}<\mathrm{f}_{\text {SYNC }}<$ 3.5 MHz (3.2MHz option). Connect to PGND_if the SYNC feature is not used.

## Current Limit/Short-Circuit Protection

The PMICs offer a current-limit feature that protects the devices against short-circuit and overload conditions on each output. In the event of a short-circuit or overload

Figure 3. Power-Up Soft-Start Delays
condition at an output, the high-side MOSFET remains on until the inductor current reaches the high-side MOSFET's current-limit threshold. The converter then turns on the low-side MOSFET and the inductor current ramps down. The converter allows the high-side MOSFET to turn on only when the inductor current ramps down to the lowside MOSFET's current threshold. This cycle repeats until the short or overload condition is removed.

## Overtemperature Protection

Thermal-overload protection limits the total power dissipation in the PMICs. When the junction temperature exceeds $185^{\circ} \mathrm{C}$ (typ), an internal thermal sensor shuts down the step-down converters, allowing the IC to cool. The thermal sensor turns on the IC again after the junction temperature cools by $15^{\circ} \mathrm{C}$. The IC goes through a standard power-up sequence as defined in the Soft-Start section.

## Applications Information

## Adjustable Output-Voltage Option

The MAX20022 features adjustable output voltages (see the Selector Guide for more details), which allows the customer to set the outputs to any voltage between 1.0 V and $V_{P V}-0.5 \mathrm{~V}$ (up to 4.0 V ). Connect a resistive divider from outpūt (VOUT_) to OUTS_ to GND to set the output voltage (see Figưre 5). Select R2 (OUTS_ to the GND resistor) less than or equal to $100 \mathrm{k} \Omega$. Calculate R1 (VOUT_ to the OUTS_resistor) with the following equation:

$$
\mathrm{R} 1=\mathrm{R} 2\left[\left(\frac{\mathrm{~V}_{\mathrm{OUT}_{-}}}{\mathrm{V}_{\text {OUTS }_{-}}}\right)-1\right]
$$

where VOUTS $=1000 \mathrm{mV}$ (see the Electrical Characteristics table). The output voltage is nominal at 50\% load current.

Figure 4. Effect of Spread-Spectrum on Internal Oscillator

The external feedback resistive divider must be frequency compensated for proper operation. Place a capacitor across R1 in the resistive divider network. Use the following equation to determine the value of the capacitor:

$$
\text { If } \frac{\mathrm{R} 2}{\mathrm{R} 1}>1, \mathrm{C} 1=\mathrm{C}\left(\frac{\mathrm{R} 2}{\mathrm{R} 1}\right)
$$

else $C 1=C$, where $C=15 p F$
Connect OUTS_ to $\mathrm{V}_{\text {OUT_ }}$ for a fixed 1.0 V output voltage.

## Inductor Selection

The PMICs are optimized for use with a $1.5 \mu \mathrm{H}$ inductor for 2.2 MHz and 3.2 MHz operation. Chip inductors can be used for additional board-space savings.

## Input Capacitor

The PMICs are designed to operate with a single $2.2 \mu \mathrm{~F}$ ceramic bypass capacitor on each PV_ input. Phase interleaving of the four buck converters contributes to a lower required input capacitance by canceling input ripple currents. Place the bypass capacitors as close as possible to their corresponding PV_ input to ensure the best EMI and jitter performance.

## Output Capacitor

All outputs of the PMICs are optimized for use with a $10 \mu \mathrm{~F}$ X7R ceramic capacitor. Additional output capacitance can be used if better voltage ripple or load transient response is required. Due to the soft-start sequence, the device is unable to drive arbitrarily large output capacitors.

## Thermal Considerations

How much power the package can dissipate strongly depends on the mounting method of the IC to the PCB and the copper area for cooling. Using the JEDEC test standard, the maximum power dissipation allowed is 2285 mW in the TQFN package. More power dissipation

Figure 5. Adjustable Output-Voltage Configuration
can be handled by the package if great attention is given during PCB layout. For example, using the top and bottom copper as a heatsink and connecting the thermal vias to one of the middle layers (GND) transfers the heat from the package into the board more efficiently, resulting in lower junction temperature at high power dissipation in some PMIC applications. Furthermore, the solder mask around the IC area on both top and bottom layers can be removed to radiate the heat directly into the air. The maximum allowable power dissipation in the IC is as follows:

$$
P_{\mathrm{MAX}}=\frac{\left(\mathrm{T}_{\mathrm{J}(\mathrm{MAX})}-\mathrm{T}_{\mathrm{A}}\right)}{\theta_{\mathrm{JC}}+\theta_{\mathrm{CA}}}
$$

where $T_{J(M A X)}$ is the maximum junction temperature $\left(+150^{\circ} \mathrm{C}\right), \mathrm{T}_{\mathrm{A}}$ is the ambient air temperature, $\theta_{\mathrm{JC}}\left(3^{\circ} \mathrm{C} / \mathrm{W}\right.$ for the 28-pin TQFN) is the thermal resistance from the junction to the case, and $\theta_{C A}$ is the thermal resistance from the case to the surrounding air through the PCB, copper traces, and the package materials. $\theta_{\mathrm{CA}}$ is directly related to system-level variables and can be modified to increase the maximum power dissipation.
The TQFN package has an exposed thermal pad on its underside. This pad provides a low thermal-resistance path for heat transfer into the PCB. This low thermally resistive path carries a majority of the heat away from the IC. The PCB is effectively a heatsink for the IC. The exposed pad should be connected to a large ground plane for proper thermal and electrical performance. The minimum size of the ground plane is dependent upon many system variables. To create an efficient path, the exposed pad should be soldered to a thermal landing, which is connected to the ground plane by thermal vias. The thermal landing should be at least as large as the exposed pad and can be made larger depending on the amount of free space from the exposed pad to the other pin landings. A sample layout is available on the MAX20022 evaluation kit to speed designs.

## PCB Layout Guidelines

Careful PCB layout is critical to achieve low switching losses and clean, stable operation. Use a multilayer board whenever possible for better noise immunity and power dissipation. Follow these guidelines for good PCB layout:

1) Use a large contiguous copper plane under the PMIC packages. Ensure that all heat-dissipating components have adequate cooling.
2) Keep the high-current paths short, especially at the ground terminals. This practice is essential for stable, jitter-free operation. The high current path comprising of input capacitor, inductor, and the output capacitor should be as short as possible.
3) Keep the power traces and load connections short. This practice is essential for high efficiency. Use thick copper PCBs (2oz vs. 1oz) to enhance full-load efficiency.
4) Use a single ground plane to reduce the chance of ground potential differences. With a single ground plane, enough isolation between analog return signals and high-power signals must be maintained.

## Typical Operating Circuit

## Ordering Information

| PART | FREQUENCY | TEMP RANGE | PIN-PACKAGE |
| :--- | :---: | :---: | :--- |
| MAX20021ATI_/V+ | 3.2 MHz | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ | 28 TQFN-EP* |
| MAX20022ATI_/V+ | 2.2 MHz | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ | 28 TQFN-EP* |

Note: Insert the desired suffix letter (from the Selector Guide) into the blank area "_" to indicate factory-selectable features. /V denotes an automotive qualified part that conforms to AEC-Q100.
+Denotes a lead $(\mathrm{Pb})$-free/RoHS-compliant package.
*EP = Exposed pad.

*Contact factory for options that are not included. Factory-selectable features include:

- DC-DC voltages in 100 mV steps between 1.0 V and 4.0 V .
- Spread spectrum enabled or disabled.
- UVM enabled or disabled.
- Number of cycles in active timeout period
- Independent current limit for each channel up to 1A.

## Package Information

For the latest package outline information and land patterns (footprints), go to www.maximintegrated.com/packages. Note that a " + ", "\#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

| PACKAGE TYPE | PACKAGE CODE | OUTLINE NO. | LAND PATTERN NO. |
| :---: | :---: | :---: | :---: |
| 28 TQFN-EP | $\mathrm{T} 2855+5$ | $\underline{21-0140}$ | $\underline{\underline{90-0025}}$ |

## MAX20021/MAX20022

## Revision History

| REVISION <br> NUMBER | REVISION <br> DATE | DESCRIPTION | PAGES <br> CHANGED |
| :---: | :---: | :--- | :---: |
| 0 | $3 / 13$ | Initial release | - |
| 1 | $4 / 13$ | Removed future product reference for the MAX20022 | 15 |
| 2 | $12 / 13$ | Added AEC-Q100 reference to Ordering Information | 15 |
| 3 | $8 / 14$ | Added two new MAX20021 options to Selector Guide | 15 |
