## Precision, 16-Channel/Dual 8-Channel, High-Performance, CMOS Analog Multiplexers

## General Description

The MAX306/MAX307 precision, monolithic, CMOS analog multiplexers (muxes) offer low on-resistance (less than $100 \Omega$ ), which is matched to within $5 \Omega$ between channels and remains flat over the specified analog signal range ( $7 \Omega$, max). They also offer low leakage over temperature ( $\mathrm{l}_{\mathrm{NO}(\mathrm{OFF})}$ less than 2.5 nA at $+85^{\circ} \mathrm{C}$ ) and fast switching speeds (tTRANs less than 250ns). The MAX306 is a single-ended 1-of-16 device, and the MAX307 is a differential 2-of-8 device.

The MAX306/MAX307 are fabricated with Maxim's improved 44V silicon-gate process. Design improvements yield extremely low charge injection (less than 10pC) and guarantee electrostatic discharge (ESD) protection greater than 2000 V .

These muxes operate with a single +5 V to +30 V supply, or bipolar $\pm 4.5 \mathrm{~V}$ to $\pm 20 \mathrm{~V}$ supplies, while retaining TTL/ CMOS-logic input compatibility and fast switching. CMOS inputs provide reduced input loading. These improved parts are plug-in upgrades for the industrystandard DG406, DG407, DG506A, and DG507A.

## Applications

- Sample-and-Hold Circuits
- Test Equipment
- Military Radios
- Heads-Up Displays
- Guidance and Control Systems
- Communications Systems
- Battery-Operated Systems PBX, PABX
- Audio Signal Routing

## Benefits and Features

- Guaranteed On-Resistance Match Between Channels, < $5 \Omega$ Max
- Low On-Resistance, < $100 \Omega$ Max
- Guaranteed Flat On-Resistance Over Specified Signal Range, $7 \Omega$ Max
- Guaranteed Charge Injection, < 10pC
- $I_{\text {NO(OFF) }}$ Leakage $<2.5 \mathrm{nA}$ at $+85^{\circ} \mathrm{C}$
- $\mathrm{I}_{\mathrm{COM}(\mathrm{OFF})}$ Leakage $<20 \mathrm{nA}$ at $+85^{\circ} \mathrm{C}$
- ESD Protection > 2000V
- Plug-In Upgrade for Industry-Standard DG406/DG407/DG506A/DG507A
- Single-Supply Operation (+5V to +30 V ) Bipolar-Supply Operation ( $\pm 4.5 \mathrm{~V}$ to $\pm 20 \mathrm{~V}$ )
- Low Power Consumption, $<1.25 \mathrm{~mW}$
- Rail-to-Rail Signal Handling
- TTL/CMOS-Logic Compatible

## Ordering Information

| MAX30_C_ _ ............................................... $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ |
| MAX30_E_ _ ............................................ $40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| MAX30_MJI ............................................ $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Storage Temperature Range ......................... $65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Lead Temperature (soldering, 10s) .............................. $300^{\circ} \mathrm{C}$ |
| Soldering Temperature (reflow) |
| PDIP, Wide SO, TSSOP lead(Pb)-free ...................... $260^{\circ} \mathrm{C}$ |
| PDIP, Wide SO, TSSOP containing lead(Pb)............. $240^{\circ} \mathrm{C}$ |
| PLCC lead(Pb)-free .............................................. $+245^{\circ} \mathrm{C}$ |
| PLCC containing lead (Pb)...................................... $225^{\circ} \mathrm{C}$ |
| CERDIP .............................................................. $240^{\circ} \mathrm{C}$ |

Note 1: Signals on NO, COM, A0, A1, A2, A3, or EN exceeding V+ or V- are clamped by internal diodes. Limit forward current to maximum current ratings.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2: The algebraic convention where the most negative value is a minimum and the most positive value a maximum is used in this data sheet.
Note 3: Guaranteed by design.
Note 4: $\Delta R_{\mathrm{ON}}=\mathrm{R}_{\mathrm{ON}(M A X)}-\mathrm{R}_{\mathrm{ON}(\mathrm{MIN})}$. On-resistance match between channels and flatness are guaranteed only with specified voltages. Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured at the extremes of the specified analog signal range.
Note 5: Leakage parameters are $100 \%$ tested at the maximum-rated hot temperature and guaranteed by correlation at $+25^{\circ} \mathrm{C}$.
Note 6: Off-isolation $=20 \log \mathrm{~V}_{\mathrm{COM}} / \mathrm{V}_{\mathrm{NO}}$, where $\mathrm{V}_{\mathrm{COM}}=$ output and $\mathrm{V}_{\mathrm{NO}}=$ input to off switch.

## Typical Operating Characteristics

( $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted.)

## Pin Description

| MAX306 <br> PIN | NAME | FUNCTION |
| :---: | :---: | :--- |
| 1 | V+ | Positive Supply Voltage Input |
| $2,3,13$ | N.C. | No Connection. Not internally <br> connected. |
| $4-11$ | NO16-NO9 | Analog Inputs-bidirectional |
| 12 | GND | Ground |
| $14-17$ | A3-A0 | Address Inputs |
| 18 | EN | Enable Inputs |
| $19-26$ | NO1-NO8 | Analog Inputs-bidirectional |
| 27 | V- | Negative Supply Voltage Input |
| 28 | COM | Output-bidirectional |

## Applications Information

## Operation with Supply Voltages Other than $\pm 15 \mathrm{~V}$

Using supply voltages other than $\pm 15 \mathrm{~V}$ will reduce the analog signal range. The MAX306/MAX307 switches operate with $\pm 4.5 \mathrm{~V}$ to $\pm 20 \mathrm{~V}$ bipolar supplies or with a +5 V to +30 V single supply; connect V - to GND when operating with a single supply. Also, both device types can operate with unbalanced supplies such as +24 V and -5 V . The Typical Operating Characteristics graphs show typical onresistance with $20 \mathrm{~V}, 15 \mathrm{~V}, 10 \mathrm{~V}$, and 5 V supplies. (Switching times increase for 5 V operation, up to a maximum of $10 \mu \mathrm{~s}$.)

## Overvoltage Protection

Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings because stresses beyond the listed ratings may cause permanent damage to the devices. Always sequence $V+$ on first, then $V$-, followed by either the logic inputs, NO or COM. If power-supply sequencing is not possible, add two small-signal diodes in series with supply pins for overvoltage protection (Figure 1). Adding diodes reduces the analog signal range to 1 V above

| MAX307 <br> PIN | NAME | FUNCTION |
| :---: | :---: | :--- |
| 1 | V+ | Positive Supply Voltage Input |
| 2 | COMB | Output B-bidirectional |
| $3,13,14$ | N.C. | No Connection. Not internally <br> connected. |
| $4-11$ | NO8B-NO1B | Analog Inputs-bidirectional |
| 12 | GND | Ground |
| $15,16,17$ | A2, A1, A0 | Address Inputs |
| 18 | EN | Enable Input |
| $19-26$ | NO1A-NO8A | Analog Inputs-bidirectional |
| 27 | V- | Negative Supply Voltage Input |
| 28 | COMA | Output A-bidirectional |

V+ and 1 V below V -, but low switch resistance and low leakage characteristics are unaffected. Device operation is unchanged, and the difference between $\mathrm{V}+$ and V should not exceed +44 V .
