

# MAX3107 Evaluation Kit

## General Description

The MAX3107 evaluation kit (EV kit) provides a proven design to evaluate the MAX3107 advanced universal asynchronous receiver-transmitter (UART) with 128 words each of receive and transmit first-in/first-out (FIFO) that can be controlled through I<sup>2</sup>C or high-speed SPI™. The EV kit also includes Windows XP®, Windows Vista® and Windows® 7-compatible software that provides a simple graphical user interface (GUI) for exercising the features of the MAX3107.

The EV kit comes with a MAX3107EAG+ installed.

## Features

- ◆ On-Board Microcontroller Generates I<sup>2</sup>C- and SPI-Compatible Signals
- ◆ On-Board RS-232 and RS-422/RS-485 Transceivers
- ◆ Headers for User-Supplied Digital Signals
- ◆ Windows XP-, Windows Vista-, and Windows 7-Compatible Software
- ◆ RS-232 Connection (Cable Included)
- ◆ Proven PCB Layout
- ◆ Fully Assembled and Tested

## Ordering Information

PART	TYPE
MAX3107EVKIT+	EV Kit

+Denotes lead(Pb)-free and RoHS compliant.

## Component List

DESIGNATION	QTY	DESCRIPTION
AGND, DGND (x3)	4	Test points, black

# MAX3107 Evaluation Kit

Evaluates: MAX3107

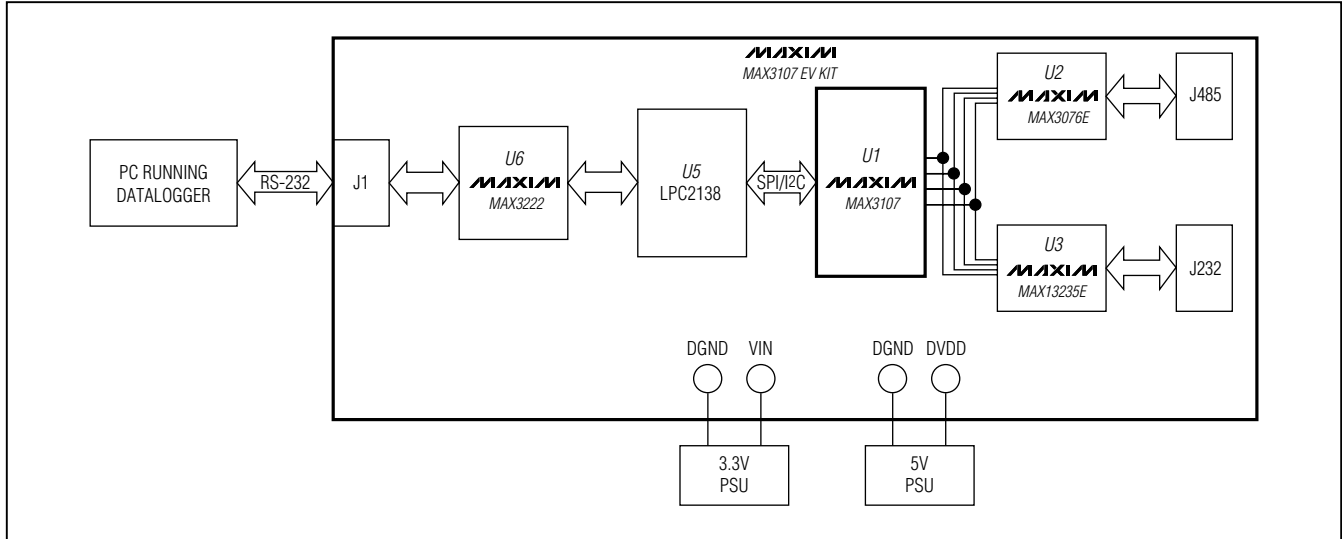

Figure 1. MAX3107 EV Kit Block Diagram

## Quick Start

### Description of Quick Start

The *Quick Start* (Figure 1) implements a local loopback of the data that the MAX3107 IC sends out through the RS-232 transceiver. The characters “Hello World!” are successively loaded into the transmit FIFO and automatically sent out by the IC at 115kBd with 8E1 formatting. The internal oscillator is used and the PLL is enabled for 6x multiplication. The baud-rate generator divides the reference clock by 2 to result in 115kBd in the standard 1x mode. The IC is controlled with the SPI interface at 13MHz. The receive FIFO is read out successively to show the hex values of the “Hello World!” string in the command line.

### Required Equipment

- MAX3107 EV kit (COM port cable included)
- 5V DC power supply
- 3.3V DC power supply
- User-supplied Windows XP, Windows Vista, or Windows 7 PC with a spare RS-232 port

**Note:** In the following sections, software-related items are identified by bolding. Text in **bold** refers to items directly from the EV kit software. Text in **bold and underlined** refers to items from the Windows operating system.

## Procedure

The MAX3107 EV kit is fully assembled and tested. Follow the steps below to verify board operation. **Caution: Do not turn on the power supply until all connections are completed.**

- 1) Visit [www.maxim-ic.com/evkitsoftware](http://www.maxim-ic.com/evkitsoftware) to download the latest version of the EV kit software, 3107Rxx.ZIP. Save the EV kit software to a temporary folder and uncompress the ZIP file.
- 2) Install the EV kit software on your computer by running the INSTALL.EXE program inside the temporary folder. The program files are copied and icons are created in the Windows **Start | Programs** menu.
- 3) Verify that all jumpers are in their default positions, as shown in the Tables 3, 4, and 5.
- 4) Connect the COM port from the PC to the J1 connector on the EV kit board.
- 5) Connect the positive terminal of the 5V power supply to the VIN connector.
- 6) Connect the negative terminal of the 5V power supply to the DGND connector.
- 7) Connect the positive terminal of the 3.3V power supply to the DVDD connector.
- 8) Connect the negative terminal of the 3.3V power supply to the DGND connector.

# MAX3107 Evaluation Kit

- 9) Turn on the power supplies.
- 10) Start the EV kit software by opening its icon in the **Start | Programs** menu. The EV kit software main window appears, as shown in Figure 2.
- 11) If a COM port on the PC other than COM1 is connected to the EV kit, click on the **Configuration** menu and click on the **Target COM Settings...** menu item. Enter the appropriate COM port number into the **Port #** edit box (leave everything else unchanged), and press the **OK** button.
- 12) Press the **Start** button in the main window.
- 13) Under the **View** menu item, select **CLI** and the **Target-CLI** sub-window appears, as shown in Figure 3.
- 14) In the **Script** group box, press the browse button (...).
- 15) Select the Test\_loopback.cli file from **C:\Program File\MAX3107**.
- 16) Press the **go** button in the **Script** group box. The EV kit software GUI commands the microcontroller to have the IC send out the string "Hello World!" These characters are converted to RS-232 levels by the MAX13235E and looped back by jumper JU35. The IC receives the data back at RX and saves it in its RxFIFO. The microcontroller reads the data out of RxFIFO and sends it to the software.
- 17) Verify the received string is "Hello World!" in hex.

## Detailed Description of Software

The main window of the evaluation software (Figure 2) provides a command-line interface (**CLI**) to control the MAX3107 IC. Press the **Start** button to establish a communication session between the PC and the EV kit. After a communication session is established, the software changes its appearance, as shown in Figure 3. See Table 1 for the list of commands. All the commands starting with "ru36" are used to configure the IC.

To execute a single command, enter the command into the **Command Entry** edit box and press the Enter key. The result of the command is displayed in the **Command Result** box.

The user can also write a sequence of commands into a script file (\*.CLI). To run the script file, press the browse button (...) in the **Script** group box to select the script file, and press the **go** button to execute. The **Delay** edit box defines the delay in milliseconds between each command in the script.

# MAX3107 Evaluation Kit

**Table 1. Command List**

CONTROL COMMAND	DESCRIPTION
util chg_clk_cfg 48000000	Set the microprocessor's clock to the maximum frequency (48MHz).
ru36 rd [addr]	Reads data from a selected register.
ru36 wrt [addr]	Writes data to a selected register.
ru36 gpio_cfg_dir [GPIO #] [dir]	Configures the direction (input or output) of an IO pin.
ru36 gpio_cfg_odrvr [GPIO #] [driver]	Configures the output driver (push-pull or open drain) of an IO pin.
ru36 gpio_rd [GPIO #]	Reads the logic level of an IO pin.
ru36 gpio_wrt [GPIO #] [level]	Writes the logic level of an IO pin.
ru36 hw_spi	Switches device driver to SPI.
ru36 spi_freq [frequency Hz]	Changes the SPI bus frequency. Frequency range = 189kHz to 24MHz. The microprocessor's clock must be set to the maximum frequency prior to using this command.
ru36 hw_i2c	Switches device driver to I <sup>2</sup> C.
ru36 i2c_addr [7-bit address]	Sets the I <sup>2</sup> C address.
ru36 i2c_br [bit rate Hz]	Sets the I <sup>2</sup> C clock rate.
tm set_test_msg [message]	Test manager command. Sets test message in ASCII format. Maximum message length = 65 characters. Example: tm set_test_msg Hello World!
tm start_data2_src	Test manager command. Microprocessor continuously and repeatedly writes the test message to the Tx FIFO until terminated by the "tm stop" command.
tm start_data2_snk	Test manager command. Microprocessor continuously empties the Rx FIFO until terminated by the "tm stop" command.
tm stop	Test manager command. Stops the test manager command start_data2_snk or start_data2_src.

**Note:** Dir: 1 = Output, 0 = Input  
 GPIO #: 0 = GPIO0, 1 = GPIO1, 2 = GPIO2, 3 = GPIO3  
 Level: 0 = Logic-level low, 1 = Logic-level high  
 Driver: 1 = Push-pull, 0 = Open drain

## Detailed Description of Hardware

The MAX3107 EV kit provides a proven design to evaluate the MAX3107 IC advanced UART with 128 transmit/receive FIFOs that can be controlled through I<sup>2</sup>C or high-speed SPI. An on-board RS-485/RS-422 transceiver, RS-232 transceiver, and easy-to-use RS-232-to-PC connection are included on the EV kit.

### Transceivers

The UART signals of the IC can be connected to either the RS-485/RS-422 transceiver (U2) or the RS-232 transceiver (U3). See Tables 3 and 4 to select the appropriate transceiver.

### Connectors

The EV kit has three connectors (J1, J485, and J232) and three headers (JUART, JIO, and JL). See Table 2 for the details about the connectors.

## User-Supplied Digital I/O and I<sup>2</sup>C/SPI Interface

To use the MAX3107 EV kit with a user-supplied digital I/O and an I<sup>2</sup>C/SPI interface, first move the shunts of JU2–JU8 to the 2-3 position, and remove the shunt on JU1. Next, connect the user-supplied SPI/I<sup>2</sup>C,  $\overline{RST}$ , DOUT/SDA, SCLK/SCL,  $\overline{CS}/A0$ , DIN/A1,  $\overline{IRQ}$ , and LDOEN signals to the corresponding pins on the JL header.

### Power Supply

The on-board microprocessor and transceivers are powered by the on-board LDO. Apply a 3.6V to 5V supply to the VIN and DGND connectors to power the LDO.

The VL, VA, and VEXT inputs of the MAX3107 can be supplied separately by connecting the individual supplies to the DVDD, AVDD, and VEXT connectors, respectively. To connect VL, VA, and VEXT together, install the shunts on JU40 and JU41.

# MAX3107 Evaluation Kit

Evaluates: MAX3107

**Table 2. Connector Descriptions**

CONNECTOR	DESCRIPTION
JIO	A 2 x 4 header that connects to the GPIOs of the MAX3107
JL	A 2 x 8 header that connects to the digital signals ( $\overline{I2C}$ /SPI, $\overline{RST}$ , DOUT/SDA, SCLK/SCL, $\overline{CS}/A0$ , DIN/A1, $\overline{IRQ}$ , and LDOEN) of the MAX3107
JUART	A 2 x 4 header that connects to the UART signals of the MAX3107
J1	The PC communicates with the on-board microprocessor through this DB9 connector
J232	The DB9 connector that connects to the RS-232 signals of the on-board RS-232 transceiver
J485	The 4-position terminal block that connects to the RS-485/RS-422 signals of the RS-485/RS-422 transceiver
