

## MAX31342 SHIELD

Evaluates: MAX31342

### General Description

The MAX31342 shield is a fully assembled and tested PCB to evaluate the MAX31342, low-current, real-time clock (RTC) with I<sup>2</sup>C interface. The shield operates from a single supply, either from USB or external power supply, and the onboard crystal provides a 32.768kHz clock signal. This device is accessed through an I<sup>2</sup>C serial interface.

The MAX31342 shield provides the hardware and software graphical user interface (GUI) necessary to evaluate the MAX31342. The shield includes a MAX31342EWA+T installed. The shield connects to the PC through a MAX32625PICO Board and a micro-USB cable.

### Features

- Easy Evaluation of the MAX31342
- +1.6V to 3.6V Single-Supply Operation
- Proven PCB Layout
- Mbed/Arduino Platform Compatible
- Fully Assembled and Tested

### Shield Contents

- Assembled MAX32625PICO controller board
- Micro-USB cable
- Assembled circuit board includes the MAX31342EWA+T

**Ordering Information** appears at end of data sheet.

### Quick Start

#### Required Equipment

- One Pico Ammeter for measuring the current
- One oscilloscope with probe
- One PC with Microsoft Windows 7, or later
- One USB A male to micro B USB cable
- One assembled and programmed MAX32625PICO board
- One MAX31342 Shield

### Shield Board

### MAX32625PICO Board

**Procedure**

The shield is fully assembled and tested. Follow the steps below to verify board operation.

- 1) Place the MAX31342 shield on a nonconductive surface to ensure that nothing on the PCB gets shorted to the workspace.
- 2) Set the jumpers of JU4, JU6, and JU7 to their default positions. Leave the jumper JU1 open.
- 3) Connect the MAX32625PICO Board to the shield as shown in [Figure 1](#).
- 4) Connect the USB A male to micro B male cable between the MAX32625PICO board and PC/laptop.
- 5) Go to the MAX31342 Shield product page to download and install the latest version of the MAX31342 RTC Shield software.
- 6) Open the MAX31342 RTC Shield software. Configuration and Time tab will be shown [Figure 2](#).

## Detailed Description

The MAX31342 shield is a fully assembled and tested PCB to evaluate the MAX31342, low-current, real-time clock (RTC) with I<sup>2</sup>C interface. The shield operates from a single supply, either from USB or external power supply, and the onboard crystal provides a 32.768kHz clock signal. This device is accessed through an I<sup>2</sup>C serial interface.

The MAX31342 shield provides the hardware and software graphical user interface (GUI) necessary to evaluate the MAX31342. The shield includes a MAX31342EWA+T installed. The shield connects to the PC through a MAX32625PICO board and a micro-USB cable.

## Functional Test Procedure

### Real-Time Monitoring

To monitor the time and date, on **Configuration and Time** tab, in **RTC Configuration** group box, enable **Oscillator Enable**, and under **Real Time Monitoring** group box, press **Read** button for one-time reading or check the **Auto Update** checkbox for continuous reading.

The time and date values can be updated by selecting the required values in the **Date/Time Configuration** group box and clicking the **Set** button.

The time stops counting when enabling **Data Retention** in **RTC Configuration** group box and restarts when disabling **Data Retention** and toggling **Oscillator Enable**. The time resets to **00:00:00** by enabling **Soft Reset** in **RTC Configuration** group box and it restarts by disabling **Soft Reset**.

### Current Draw at Time-Keeping Mode

To measure the current draw under normal Real-Time Clock condition, without any interrupt or clock input/output:

- 1) Remove the jumper from **JU7** on the shield.
- 2) With the output set to the desired DC voltage (1.6V to 3.6V) and disabled, connect the positive terminal of the DC supply, through the pico ammeter, to pin 1 of **JU7** and negative terminal to the ground of the shield.
- 3) In **Configuration and Time** tab of the software, under **RTC Configuration** group box, press **Read** button, disable the **CLKIN** and **CLKOUT**, and select **1Hz** for **CLKIN Frequency** and **CLKOUT Frequency**. Under **Real Time Monitoring**, uncheck **Auto Update**.
- 4) The reading on the pico ammeter is the current drawn by MAX31342 only.

**Note:** All instruments need to be disconnected from the I/O ports of the IC, since any loading would increase current consumption.

### CLKOUT Frequency

In **Configuration and Time** tab of the software, under **RTC Configuration** group box, select **CLKOUT** and the desired **CLKOUT Frequency**. The clock output can be monitored using an oscilloscope connected to the  $\overline{\text{INTB}}$ /CLKOUT test point. A frequency counter can also be used to measure the clock frequency accurately.

### Alarm Configuration

On the MAX31342 shield board, set jumper JU1 to 1-2 and jumper JU6 to 1-4.

In **Alarms and Timer** tab of the software, under **Alarm 1 Configuration** group box, select the Repetition Rate to set the alarm, and make selections for all other relevant fields (such as Min, Sec, etc.). In **Interrupts and Flags** group box, enable alarm 1 by checking the **Alarm 1** Interrupt check box. When the Real-Time clock reaches the alarm1 match condition,  $\overline{\text{INTA}}$ /CLKIN will go from high to low. Under **Flags** group box, press **Read** button to read the status and clear the alarm flag bit if it has been previously set.

Repeat the same steps for Alarm 2 but measure the alarm interrupt output at  $\overline{\text{INTB}}$ /CLKOUT test point.

**Note:** When testing alarm interrupts, **CLKIN** and **CLKOUT** need to be disabled under **RTC Configuration** group box in **Configuration and Time** tab of the software.

For more detail on using the software, refer to the MAX31342 shield software user's guide.

## Jumper Settings

JUMPER	SHUNT POSITION	DESCRIPTION
JU1	1-2	$\overline{\text{INTB}}/\text{CLKOUT}$ pin of U1 is connected to IO $V_{\text{CC}2}$ pin of the level translator (U2)
	OPEN*	$\overline{\text{INTB}}/\text{CLKOUT}$ pin of U1 is unconnected
JU4	1-2	System $V_{\text{CC}}$ powered by $V_{\text{CC\_EXT}}$ test point
	2-3*	System $V_{\text{CC}}$ powered by 3.3V supply on mbed/Arduino platform
JU6	1-2	$\overline{\text{INTA}}/\text{CLKIN}$ pin of U1 is connected to ground
	1-3	$\overline{\text{INTA}}/\text{CLKIN}$ pin of U1 is connected to IO $V_{\text{CC}1}$ pin of the level translator (U2)
	1-4*	$\overline{\text{INTA}}/\text{CLKIN}$ is connected to TP4 test point and a 4.7K $\Omega$ pullup resistor to system $V_{\text{CC}}$
JU7	1-2*	$V_{\text{CC}}$ pin of U1 is powered by system $V_{\text{CC}}$
	OPEN	$V_{\text{CC}}$ pin of U1 is unconnected. Connect an ammeter between the pins of JU7 to measure the current consumption of U1.
