## General Description

The MAX396/MAX397 low-voltage, CMOS analog multiplexers (muxes) offer low on-resistance ( $100 \Omega$ max), which is matched to within $6 \Omega$ between switches and remains flat over the specified signal range ( $10 \Omega$ max). They also offer low leakage over temperature (input off-leakage current less than 1 nA at $+85^{\circ} \mathrm{C}$ ) and fast switching speeds (transition time less than 250ns). The MAX396 is a 16-channel device, and the MAX397 is a dual, 8-channel device.
The MAX396/MAX397 are fabricated with Maxim's lowvoltage silicon-gate process. Design improvements yield extremely low charge injection (5pC max) and guarantee electrostatic-discharge (ESD) protection greater than 2000V per Method 3015.7
These muxes operate with a single +2.7 V to +16 V supply or with $\pm 2.7 \mathrm{~V}$ to $\pm 8 \mathrm{~V}$ dual supplies, while retaining CMOSlogic input compatibility and fast switching. The MAX396/ MAX397 are pin compatible with the industry standard MAX306/MAX307, DG406/DG407, and DG506A/DG507A.

## Benefits and Features

- Pin-Compatible with MAX306/MAX307, DG406/DG407, DG506A/DG507A
- Single-Supply Operation (+2.7V to +16 V ) Dual-Supply Operation ( $\pm 2.7 \mathrm{~V}$ to $\pm 8 \mathrm{~V}$ )
- Low On-Resistance (100 10 max )
- Guaranteed RON Match Between Channels ( $6 \Omega$ max)
- Guaranteed RON Flatness over Specified Signal Range (10ת max)
- Guaranteed Low Charge Injection (5pC max)
- Input Off-Leakage Current $<1 \mathrm{nA}$ at $+85^{\circ} \mathrm{C}$
- Output Off-Leakage Current $<2.5 n \mathrm{~A}$ at $+85^{\circ} \mathrm{C}$
- Low Power Consumption < $10 \mu \mathrm{~W}$
- TTL/CMOS Compatible

## Applications

- Sample-and-Hold Circuits - Automatic Test Equipment
- Avionics - Communications Systems
- Battery-Operated Equipment - Audio Signal Routing
- Low-Voltage Data Acquisition - Industrial Process Control Systems

Note 1: Signals on any terminal exceeding $V+$ or $V$ - are clamped by internal diodes. Limit forward current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2: The algebraic convention, where the most negative value is a minimum and the most positive value a maximum, is used in this data sheet.
Note 3: Guaranteed by design.
Note 4: $\Delta \mathrm{R}_{\mathrm{ON}}=\mathrm{R}_{\mathrm{ON}(\mathrm{MAX})}-\mathrm{R}_{\mathrm{ON}(\mathrm{MIN})}$.
Note 5: Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal ranges, i.e., $\mathrm{V}_{\mathrm{NO}}=3 \mathrm{~V}$ to 0 V and 0 V to -3 V .
Note 6: Leakage parameters are $100 \%$ tested at maximum rated hot operating temperature, and guaranteed by correlation at $+25^{\circ} \mathrm{C}$.
Note 7: Worst-case isolation is on channel 4 because of its proximity to the COM pin. Off-isolation $=20 \mathrm{log} \mathrm{V}_{\mathrm{COM}} / \mathrm{V}_{\mathrm{NO}}, \mathrm{V}_{\mathrm{COM}}=$ output, $\mathrm{V}_{\mathrm{NO}}=$ input to off switch.
Note 8: Leakage testing at single supply is guaranteed by correlation testing with dual supplies.

Typical Operating Characteristics
( $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted.)

## Pin Configurations

## Pin Description

| PIN |  | NAME |  |
| :---: | :---: | :---: | :--- |
| MAX396 | MAX397 |  |  |
| 1 | 1 | V+ | Positive Supply-Voltage Input |
| $2,3,13$ | - | N.C. | No Internal Connection |
| - | 2 | COMB | Analog Signal B Output* (bidirectional) |
| - | $3,13,14$ | N.C. | No Internal Connection |
| $4-11$ | - | NO16-NO9 | Analog Signal Inputs* (bidirectional) |
| - | $4-11$ | NO8B-NO1B | Analog Signal B Inputs* (bidirectional) |
| 12 | 12 | GND | Logic Ground |
| $14-17$ | - | A3-A0 | Logic Address Inputs |
| - | $15,16,17$ | A2, A1, A0 | Logic Address Inputs |
| 18 | 18 | EN | Logic Enable Input |
| $19-26$ | - | NO1-NO8 | Analog Signal Inputs* (bidirectional) |
| - | $19-26$ | NO1A-NO8A | Analog Signal A Inputs* (bidirectional) |
| 27 | 27 | V- | Negative Supply-Voltage Input |
| 28 | - | COM | Analog Signal Output* (bidirectional) |
| - | 28 | COMA | Analog Signal A Output* (bidirectional) |

## Precision, 16-Channel/Dual 8-Channel, Low-Voltage, CMOS Analog Multiplexers

## Applications Information

## Operation with Supply Voltages Other than $\pm 5 \mathrm{~V}$

Using supply voltages less than $\pm 5 \mathrm{~V}$ reduces the analog signal range. The MAX396/MAX397 multiplexers (muxes) operate with $\pm 3 \mathrm{~V}$ to $\pm 8 \mathrm{~V}$ bipolar supplies or with a +3 V to +15 V single supply. Connect V - to GND when operating with a single supply. Both devices can also operate with unbalanced supplies, such as +10 V and -5 V . The Typical Operating Characteristics graphs show typical on-resistance with $\pm 3 \mathrm{~V}$, $\pm 5 \mathrm{~V},+3 \mathrm{~V}$, and +5 V supplies.
These muxes operate with a single supply as low as 1 V , although on-resistance and switching times become extremely high. Performance is not guaranteed below 2.7 V . This is useful information only because it assures proper switch state while power supplies ramp up or down slowly.

Figure 1. Overvoltage Protection Using External Blocking Diodes

## Overvoltage Protection

Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings, because stresses beyond the listed ratings can cause permanent damage to the devices. Always sequence $\mathrm{V}+$ on first, then $V$-, followed by the logic inputs, NO, or COM. If power-supply sequencing is not possible, add two smallsignal diodes (D1, D2) in series with supply pins for overvoltage protection (Figure 1). Adding diodes reduces the analog-signal range to one diode drop below $\mathrm{V}+$ and one diode drop above $V$-, but does not affect the devices' low switch resistance and low leakage characteristics. Device operation is unchanged, and the difference between $\mathrm{V}+$ and V - should not exceed 17 V . These protection diodes are not recommended when using a single supply.
