## General Description

The MAX4230-MAX4234 single/dual/quad, high-output drive CMOS op amps feature 200 mA of peak output current, rail-to-rail input, and output capability from a single 2.7 V to 5.5 V supply. These amplifiers exhibit a high slew rate of $10 \mathrm{~V} / \mu \mathrm{s}$ and a gain-bandwidth product (GBWP) of 10 MHz . The MAX4230-MAX4234 can drive typical headset levels (32 ), as well as bias an RF power amplifier (PA) in wireless handset applications.
The MAX4230 comes in a tiny 5-pin SC70 package and the MAX4231, single with shutdown, is offered in a 6 -pin SC70 package and in $1.5 \mathrm{~mm} \times 1.0 \mathrm{~mm}$ UCSP and thin $\mu$ DFN packages. The dual op-amp MAX4233 is offered in the space-saving 10-bump chip-scale package (UCSP ${ }^{\text {M }}$ ), providing the smallest footprint area for a dual op amp with shutdown.
These op amps are designed to be part of the PA control circuitry, biasing RF PAs in wireless headsets. The MAX4231/ MAX4233 offer a SHDN feature that drives the output low. This ensures that the RF PA is fully disabled when needed, preventing unconverted signals to the RF antenna.

## Applications

- RF PA Biasing Controls in Handset Applications
- Portable/Battery-Powered Audio Applications
- Portable Headphone Speaker Drivers (32 2 )
- Audio Hands-Free Car Phones (Kits)
- Tablet/Notebook Computers
- Digital-to-Analog Converter Buffers
- Transformer/Line Drivers
- Motor Drivers

## Selector Guide appears at end of data sheet.

Pin/Bump Configurations appear at end of data sheet.

UCSP is a trademark of Maxim Integrated Products, Inc.

## Benefits and Features

- Optimized for Headsets and High-Current Outputs
- 200mA Output Drive Capability
- 100dB Voltage Gain ( $\mathrm{R}_{\mathrm{L}}=100 \mathrm{k} \Omega$ )
- 85dB Power-Supply Rejection Ratio
- No Phase Reversal for Overdriven Inputs
- Unity-Gain Stable for Capacitive Loads to 780pF
- Suitable for High-Bandwidth Applications
- 10MHz Gain-Bandwidth Product
- High Slew Rate: 10V/ $\mu \mathrm{s}$
- Extends the Battery Life of Portable Applications
- 1.1mA Supply Current per Amplifier
- Low-Power Shutdown Mode Reduces Supply Current to $<1 \mu \mathrm{~A}$
- Small Package Options
- Tiny, $2.1 \mathrm{~mm} \times 2.0 \mathrm{~mm}$ Space-Saving SC70 Package
- AEC-Q100 Qualified, See the Ordering Information for the List of $N$ Parts

Note 1: Package power dissipation should also be observed.
Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Detailed Description

## Rail-to-Rail Input Stage

The MAX4230-MAX4234 CMOS operational amplifiers have parallel-connected $n$ - and p-channel differential input stages that combine to accept a common-mode range extending to both supply rails. The $n$-channel stage is active for common-mode input voltages typically greater than $\left(\mathrm{V}_{\mathrm{SS}}+1.2 \mathrm{~V}\right)$, and the p-channel stage is active for common-mode input voltages typically less than ( $\mathrm{V}_{\mathrm{DD}}-1.2 \mathrm{~V}$ ).

## Applications Information

## Package Power Dissipation

Warning: Due to the high output current drive, this op amp can exceed the absolute maximum powerdissipation rating. As a general rule, as long as the peak current is less than or equal to 40 mA , the maximum
package power dissipation is not exceeded for any of the package types offered. There are some exceptions to this rule, however. The absolute maximum power-dissipation rating of each package should always be verified using the following equations. The equation below gives an approximation of the package power dissipation:

$$
\mathrm{P}_{\mathrm{IC}(\mathrm{DISS})} \cong \mathrm{V}_{\mathrm{RMS}} \mathrm{I}_{\mathrm{RMS}} \cos \theta
$$

where:
$V_{\text {RMS }}=R M S$ voltage from $V_{D D}$ to $V_{\text {OUT }}$ when sourcing current and RMS voltage from $\mathrm{V}_{\mathrm{OUT}}$ to $\mathrm{V}_{\text {SS }}$ when sinking current.
$I_{\text {RMS }}=$ RMS current flowing out of or into the op amp and the load.
$\theta=$ phase difference between the voltage and the current. For resistive loads, $\operatorname{COS} \theta=1$.

Figure 1. MAX4230/MAX4231 Used in Single-Supply Operation Circuit Example

For example, the circuit in Figure 1 has a package power dissipation of 196 mW :

$$
\begin{aligned}
\mathrm{RMS} & \cong\left(\mathrm{~V}_{\mathrm{DD}}-\mathrm{V}_{\mathrm{DC}}\right)+\frac{\mathrm{V}_{\mathrm{PEAK}}}{\sqrt{2}} \\
& =3.6 \mathrm{~V}-1.8 \mathrm{~V}+\frac{1.0 \mathrm{~V}}{\sqrt{2}}=2.507 \mathrm{~V}_{\mathrm{RMS}} \\
\mathrm{I}_{\mathrm{RMS}} & \cong \mathrm{I}_{\mathrm{DC}}+\frac{\mathrm{I}_{\text {PEAK }}}{\sqrt{2}}=\frac{1.8 \mathrm{~V}}{32 \Omega}+\frac{1.0 \mathrm{~V} / 32 \Omega}{\sqrt{2}} \\
& =78.4 \mathrm{~mA} \mathrm{RMS}_{\mathrm{RMS}}
\end{aligned}
$$

where:
$V_{D C}=$ the $D C$ component of the output voltage.
$I_{D C}=$ the DC component of the output current.
$V_{\text {PEAK }}=$ the highest positive excursion of the AC component of the output voltage.
IPEAK $=$ the highest positive excursion of the AC component of the output current.
Therefore:

$$
\begin{aligned}
\mathrm{P}_{\mathrm{IC}(\text { DISS })} & =\mathrm{V}_{\text {RMS }} \mathrm{I}_{\text {RMS }} \operatorname{COS} \theta \\
& =196 \mathrm{~mW}
\end{aligned}
$$

Adding a coupling capacitor improves the package power dissipation because there is no DC current to the load, as shown in Figure 2:

Figure 2. Circuit Example: Adding a Coupling Capacitor Greatly Reduces Power Dissipation of its Package

$$
\begin{aligned}
V_{\text {RMS }} & \cong \frac{V_{\text {PEAK }}}{\sqrt{2}} \\
& =\frac{1.0 \mathrm{~V}}{\sqrt{2}}=0.707 \mathrm{~V}_{\text {RMS }} \\
\mathrm{I}_{\mathrm{RMS}} & \cong \mathrm{I}_{\mathrm{DC}}+\frac{\mathrm{I}_{\text {PEAK }}}{\sqrt{2}}=0 \mathrm{~A}+\frac{1.0 \mathrm{~V} / 32 \Omega}{\sqrt{2}} \\
& =22.1 \mathrm{~mA} \text { RMS }
\end{aligned}
$$

Therefore:

$$
\begin{aligned}
\mathrm{PIC}_{\mathrm{IC}(\mathrm{DISS})} & =\mathrm{V}_{\text {RMS }} \mathrm{I}_{\mathrm{RMS}} \operatorname{COS} \theta \\
& =15.6 \mathrm{~mW}
\end{aligned}
$$

If the configuration in Figure 1 were used with all four of the MAX4234 amplifiers, the absolute maximum power dissipation rating of this package would be exceeded (see the Absolute Maximum Ratings section).

## 60mW Single-Supply Stereo Headphone Driver

Two MAX4230/MAX4231s can be used as a single-supply, stereo headphone driver. The circuit shown in Figure 2 can deliver 60 mW per channel with $1 \%$ distortion from a single 5 V supply.
The input capacitor ( $\mathrm{C}_{\mathrm{IN}}$ ), in conjunction with $\mathrm{R}_{\mathrm{IN}}$, forms a highpass filter that removes the DC bias from the incoming signal. The -3 dB point of the highpass filter is given by

$$
\mathrm{f}_{-3 \mathrm{~dB}}=\frac{1}{2 \pi \mathrm{R}_{\mathrm{IN}} \mathrm{C}_{\mathrm{IN}}}
$$

Figure 3. Dual MAX4230/MAX4231 Bridge Amplifier for 200mW at 3 V

Choose gain-setting resistors $\mathrm{R}_{\mathrm{IN}}$ and $\mathrm{R}_{\mathrm{F}}$ according to the amount of desired gain, keeping in mind the maximum output amplitude. The output coupling capacitor, COUT, blocks the DC component of the amplifier output, preventing DC current flowing to the load. The output capacitor and the load impedance form a highpass filer with the $-3 d B$ point determined by:

$$
\mathrm{f}_{-3 \mathrm{~dB}}=\frac{1}{2 \pi \mathrm{R}_{\text {IN }} \mathrm{C}_{\text {OUT }}}
$$

For a $32 \Omega$ load, a $100 \mu \mathrm{~F}$ aluminum electrolytic capacitor gives a low-frequency pole at 50 Hz .

## Bridge Amplifier

The circuit shown in Figure 3 uses a dual MAX4230 to implement a 3 V , 200 mW amplifier suitable for use in sizeconstrained applications. This configuration eliminates the need for the large coupling capacitor required by the single op-amp speaker driver when single-supply operation is necessary. Voltage gain is set to $10 \mathrm{~V} / \mathrm{V}$; however, it can be changed by adjusting the $82 \mathrm{k} \Omega$ resistor value.

## Rail-to-Rail Input Stage

The MAX4230-MAX4234 CMOS op amps have parallel connected $n$ - and $p$-channel differential input stages that combine to accept a common-mode range extending to both supply rails. The n-channel stage is active for common-mode input voltages typically greater than ( $\mathrm{V}_{\mathrm{SS}}$ +1.2 V ), and the p -channel stage is active for commonmode input voltages typically less than ( $\mathrm{V}_{\mathrm{DD}}-1.2 \mathrm{~V}$ ).

Figure 4. Rail-to-Rail Input/Output Range

## Rail-to-Rail Output Stage

The minimum output is within millivolts of ground for single-supply operation, where the load is referenced to ground ( $\mathrm{V}_{\mathrm{SS}}$ ). Figure 4 shows the input voltage range and the output voltage swing of a MAX4230 connected as a voltage follower. The maximum output voltage swing is load dependent; however, it is guaranteed to be within 500 mV of the positive rail ( $\mathrm{V}_{\mathrm{DD}}=2.7 \mathrm{~V}$ ) even with maximum load ( $32 \Omega$ to ground).
Observe the Absolute Maximum Ratings for power dissipation and output short-circuit duration (10s, max) because the output current can exceed 200 mA (see the Typical Operating Characteristics.)

## Input Capacitance

One consequence of the parallel-connected differential input stages for rail-to-rail operation is a relatively large input capacitance $\mathrm{C}_{\mathrm{IN}}(5 \mathrm{pF}$ typ). This introduces a pole at frequency $\left(2 \pi R^{\prime} C_{\mid N}\right)^{-1}$, where $R^{\prime}$ is the parallel combination of the gain-setting resistors for the inverting or noninverting amplifier configuration (Figure 5). If the pole frequency is less than or comparable to the unity-gain bandwidth $(10 \mathrm{MHz})$, the phase margin is reduced, and the amplifier exhibits degraded AC performance through either ringing in the step response or sustained oscillations. The pole frequency is 10 MHz when $R^{\prime}=2 k \Omega$. To maximize stability, $R^{\prime} \ll 2 k \Omega$ is recommended.

Figure 5. Inverting and Noninverting Amplifiers with Feedback Compensation

To improve step response when $\mathrm{R}^{\prime}>2 k \Omega$, connect small capacitor $\mathrm{C}_{\mathrm{f}}$ between the inverting input and output. Choose $\mathrm{C}_{\mathrm{f}}$ as follows:

$$
\mathrm{C}_{\mathrm{f}}=8\left(\mathrm{R} / \mathrm{R}_{\mathrm{f}}\right)[\mathrm{pf}]
$$

where $R_{f}$ is the feedback resistor and $R$ is the gain-setting resistor (Figure 5).

## Driving Capacitive Loads

The MAX4230-MAX4234 have a high tolerance for capacitive loads. They are stable with capacitive loads up to 780 pF . Figure 6 is a graph of the stable operating region for various capacitive loads vs. resistive loads. Figures 7 and $\underline{8}$ show the transient response with excessive capacitive loads ( 1500 pF ), with and without the addition of an isolation resistor in series with the output. Figure 9 shows a typical noninverting capacitive-load-driving circuit in the unity-gain configuration.

Figure 6. Capacitive-Load Stability

Figure 7. Small-Signal Transient Response with Excessive Capacitive Load

Figure 8. Small-Signal Transient Response with Excessive Capacitive Load with Isolation Resistor

Figure 9. Capacitive-Load-Driving Circuit

Figure 10. Shutdown Output Voltage Enable/Disable

The resistor improves the circuit's phase margin by isolating the load capacitor from the op amp's output.

## Power-Up and Shutdown Modes

The MAX4231/MAX4233 have a shutdown option. When the shutdown pin ( $\overline{\mathrm{SHDN}}$ ) is pulled low, supply current drops to $0.5 \mu \mathrm{~A}$ per amplifier ( $\mathrm{V}_{\mathrm{DD}}=2.7 \mathrm{~V}$ ), the amplifiers are disabled, and their outputs are driven to $\mathrm{V}_{\mathrm{SS}}$. Since the outputs are actively driven to $\mathrm{V}_{\mathrm{SS}}$ in shutdown, any pullup resistor on the output causes a current drain from the supply. Pulling SHDN high enables the amplifier. In the dual MAX4233, the two amplifiers shut down independently. Figure 10 shows the MAX4231's output voltage to a shutdown pulse. The MAX4231-MAX4234 typically settle within $5 \mu$ s after power-up. Figures 11 and 12 show IDD to a shutdown plus and voltage power-up cycle.

Figure 11. Shutdown Enable/Disable Supply Current

Figure 12. Power-Up/Down Supply Current
Selector Guide

| PART | AMPS PER <br> PACKAGE | SHUTDOWN <br> MODE |
| :---: | :---: | :---: |
| MAX4230 | Single | - |
| MAX4231 | Single | Yes |
| MAX4232 | Dual | - |
| MAX4233 | Dual | Yes |
| MAX4234 | Quad | - |

When exiting shutdown, there is a $6 \mu$ s delay before the amplifier's output becomes active (Figure 10).

## Pin/Bump Configurations

## Power Supplies and Layout

The MAX4230-MAX4234 can operate from a single 2.7 V to 5.5 V supply, or from dual $\pm 1.35 \mathrm{~V}$ to $\pm 2.5 \mathrm{~V}$ supplies. or single-supply operation, bypass the power supply with a $0.1 \mu \mathrm{~F}$ ceramic capacitor. For dual-supply operation, bypass each supply to ground. Good layout improves performance by decreasing the amount of stray capacitance at the op amps' inputs and outputs. Decrease stray capacitance by placing external components close to the op amps' pins, minimizing trace and lead lengths.

Ordering Information (continued)

| PART | TEMP <br> RANGE | PIN- <br> PACKAGE | TOP <br> MARK |
| :--- | :--- | :--- | :---: |
| MAX4232AKA +T | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ | 8 SOT23 | AAKW |
| MAX4232AKA $/ \mathrm{V}+\mathrm{T}$ | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ | 8 SOT 23 | AEQW |
| MAX4232AUA +T | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ | $8 \mu \mathrm{MAX}$ | - |

+Denotes a lead-free( Pb )/RoHS-compliant package.
$T$ = Tape and reel.
$N$ denotes an automotive-qualified part.
*EP = Exposed pad.

## Package Information

For the latest package outline information and land patterns (footprints), go to www.maximintegrated.com/packages. Note that a " + ", "\#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

| PACKAGE TYPE | PACKAGE CODE | DOCUMENT NO. | LAND PATTERN NO. |
| :---: | :---: | :---: | :---: |
| 5 SC70 | X5+1 | 21-0076 | 90-0188 |
| 6 SC70 | X6SN+1 | 21-0077 | 90-0189 |
| 5 SOT23 | U5+1 | 21-0057 | 90-0174 |
| 6 SOT23 | U6SN+1 | $\underline{21-0058}$ | 90-0175 |
| $8 \mu \mathrm{MAX}$ | U8+1 | $\underline{21-0036}$ | 90-0092 |
| 8 SOT23 | K8+5 | 21-0078 | 90-0176 |
| $10 \mu \mathrm{MAX}$ | U10+2 | 21-0061 | 90-0330 |
| 10 UCSP | B12+4 | $\underline{21-0104}$ | - |
| 6 UCSP | R61A1+1 | $\underline{\text { 21-0228 }}$ | - |
| 6 Thin $\mu \mathrm{DFN}$ (Ultra-Thin LGA) | Y61A1+1 | 21-0190 | 90-0233 |
| 14 TSSOP | U14+1 | $\underline{21-0066}$ | 90-0113 |

## Revision History

| REVISION <br> NUMBER | REVISION DATE | DESCRIPTION | PAGES CHANGED |
| :---: | :---: | :---: | :---: |
| 7 | 7/08 | Added 6-pin $\mu$ DFN package for the MAX4231 | 1, 2, 8, 13 |
| 8 | 10/08 | Corrected top mark for MAX4321, 6 SOT23 package; changed MAX4320 and 4321 to lead-free packages | 1 |
| 9 | 10/08 | Added shutdown pin limits | 3, 4 |
| 10 | 12/08 | Added automotive part number | 13 |
| 11 | 9/09 | Corrected top mark designation and pin configuration, and added UCSP package | 1, 2, 8, 13 |
| 12 | 1/10 | Updated Absolute Maximum Ratings section | 2 |
| 13 | 1/11 | Added $10 \mu \mathrm{MAX}$ to Package Information section | 14 |
| 14 | 10/11 | Updated Electrical Characteristics table with specs for bias current at various temperatures | 1-4 |
| 15 | 3/12 | Updated thermal data in the Absolute Maximum Ratings | 2 |
| 16 | 6/12 | Added automotive part number for MAX4230 | 1 |
| 17 | 12/13 | Updated teNABLE specification in the AC Electrical Characteristics | 6 |
| 18 | 10/14 | Corrected $\mu$ DFN references and added ultra-thin LGA reference to Ordering Information, Pin Configurations, and Package Information | 1, 13, 14 |
| 19 | 1/15 | Updated General Description, Applications, and Benefits and Features sections | 1 |
| 20 | 11/16 | Updated TOC22 in Typical Operating Characteristics section | 7 |
| 21 | 2/18 | Updated Benefits and Features section and Ordering Information table | 1,13 |
| 22 | 7/20 | Updated DC Electrical Characteristics table | 2 |
| 23 | 5/21 | Updated Ordering Information table | 13 |
