# SOT23, Very High Precision, 3V/5V Rail-to-Rail Op Amps 

#### Abstract

General Description The MAX4236/MAX4237 are high-precision op amps that feature an exceptionally low offset voltage and offset voltage temperature coefficient without using any chopper techniques. The MAX4236 and MAX4237 have a typical large-signal, open-loop voltage gain of 120 dB . These devices have an ultra-low input-bias current of $1 p A$. The MAX4236 is unity-gain stable with a gainbandwidth product of 1.7 MHz , while the MAX4237 is stable for closed-loop gains greater than $5 \mathrm{~V} / \mathrm{V}$ with a gain-bandwidth product of 7.5 MHz . Both devices have a shutdown function in which the quiescent current is reduced to less than $0.1 \mu \mathrm{~A}$, and the amplifier output is forced into a high-impedance state. The input common-mode range of the MAX4236/ MAX4237 extends below the negative supply range, and the output swings Rail-to-Rail ${ }^{\circledR}$. These features make the amplifiers ideal for applications with +3 V or +5 V single power supplies. The MAX4236/MAX4237 are specified for the extended temperature range $\left(-40^{\circ} \mathrm{C}\right.$ to $\left.+85^{\circ} \mathrm{C}\right)$ and are available in tiny SOT23, $\mu \mathrm{MAX}$, and SO packages. For greater accuracy, the A grade $\mu \mathrm{MAX}$ and SO packages are tested to guarantee $20 \mu \mathrm{~V}$ (max) offset voltage at $+25^{\circ} \mathrm{C}$ and less then $2 \mu \mathrm{~V} /{ }^{\circ} \mathrm{C}$ drift.

Applications

## Strain Gauges

Piezoelectric Sensors
Thermocouple Amplifiers
Electrochemical Sensors
Battery-Powered Instrumentation
Instrumentation Amplifiers

Rail-to-Rail is a registered trademark of Nippon Motorola, Inc.
Pin Configurations

- Ultra-Low Offset Voltage $20 \mu \mathrm{~V}$ (max) at $+25^{\circ} \mathrm{C}$ (Grade A) $50 \mu \mathrm{~V}$ (max) at $+25^{\circ} \mathrm{C}$ (Grade B, 6-Pin SOT23)
- Ultra-Low Offset Voltage Drift $2 \mu \mathrm{~V} /{ }^{\circ} \mathrm{C}$ (max) (Grade A)
$4.5 \mu \mathrm{~V} /{ }^{\circ} \mathrm{C}$ (max) (Grade B, 6-Pin SOT23) $5.5 \mu \mathrm{~V} /{ }^{\circ} \mathrm{C}$ (max) (6-Pin SOT23)
- Ultra-Low 1pA Input Bias Current
- High Open-Loop Voltage Gain: 110dB (min) ( $\mathrm{RL}=100 \mathrm{k} \Omega$ )
- Compatible with +3 V and +5 V Single-Supply Power Systems
- Ground Sensing: Input Common-Mode Range Includes Negative Rail
- Rail-to-Rail Output Swing into a 1k $\Omega$ Load
- $350 \mu \mathrm{~A}$ Quiescent Current
- Gain-Bandwidth Product
1.7 MHz (MAX4236, $\mathrm{Av}=1 \mathrm{~V} / \mathrm{V}$ )
7.5MHz (MAX4237, Av = 5V/V)
- 200pF Capacitive Load Handling Capability
- Shutdown Mode: 0.1 $\mu \mathrm{A}$ Quiescent Current, Places Output in a High-Impedance State
- Available in Space-Saving SOT23 and $\mu$ MAX Packages

## ABSOLUTE MAXIMUM RATINGS

|  |
| :---: |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS (SO-8 and $\mu \mathrm{MAX}-8$ )

$\left(V_{C C}=+2.4 \mathrm{~V}\right.$ to $+5.5 \mathrm{~V}, \mathrm{~V}_{E E}=0, \mathrm{~V}_{C M}=0, \mathrm{~V}_{\mathrm{OUT}}=\mathrm{V}_{C C} / 2, \mathrm{R}_{\mathrm{L}}=100 \mathrm{k} \Omega$ to $\mathrm{V}_{C C} / 2, T_{A}=\mathrm{T}_{\mathrm{MIN}}$ to $T_{M A X}$, unless otherwise noted. Typical values are at $\mathrm{V}_{\mathrm{CC}}=+5 \mathrm{~V}$ and $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$.) (Note 1)

## Detailed Description

The MAX4236／MAX4237 are high－precision op amps with a CMOS input stage and an excellent set of DC and $A C$ features．The combination of tight maximum voltage offset，low offset tempco and very low input current make them ideal for use in high－precision DC circuits．They feature low－voltage operation，low－power consumption，high－current drive with rail－to－rail output swing and high－gain bandwidth product．

## High Accuracy

The MAX4236／MAX4237 maximum input offset voltage is $20 \mu \mathrm{~V}(5 \mu \mathrm{~V}$ ，typ）for grade A version and $50 \mu \mathrm{~V}$ for grade B version at $+25^{\circ} \mathrm{C}$ ．The maximum temperature coefficient of the offset voltage for grade A and B are guaranteed to be $2 \mu \mathrm{~V} /{ }^{\circ} \mathrm{C}$ and $4.5 \mu \mathrm{~V} /{ }^{\circ} \mathrm{C}$ respectively． The parts have an input bias current of 1 pA．Noise characteristics are $14 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ ，and a low frequency noise（ 0.1 Hz to 10 Hz ）of $0.2 \mu \mathrm{Vp}-\mathrm{p}$ ．The CMRR is 102 dB ，and the PSRR is 120 dB ．The combination is what is necessary for the design of circuits to process signals while keeping high signal－to－noise ratios，as in stages preceding high－resolution converters，or when they are produced by sensors or transducers generat－ ing very small outputs．
Rail－to－Rail Outputs，Ground－Sensing Input
The input common－mode range extends from（VEE－ 0.15 V ）to（VCC -1.2 V ）with excellent common－mode rejection．Beyond this range，the amplifier output is a nonlinear function of the input，but does not undergo phase reversal or latch－up（see Typical Operating Characteristics）．

The output swings to within 150 mV of the power－supply rails with a $1 \mathrm{k} \Omega$ load．The input ground sensing and the rail－to－rail output substantially increase the dynamic range．

Power－Up and Shutdown Mode The MAX4236／MAX4237 have a shutdown option． When the shutdown pin（SHDN）is pulled low，the sup－ ply current drops to $0.1 \mu \mathrm{~A}$ ，and the amplifiers are dis－ abled with the output in a high－impedance state．Pulling SHDN high enables the amplifiers．The turn－on time for the amplifiers to come out of shutdown is $4 \mu \mathrm{~s}$ ．

## Applications Information

As described above，the characteristics of the MAX4236／MAX4237 are excellent for high－precision／ accuracy circuitry，and the high impedance，low－cur－ rent，low－offset，and noise specifications are very attractive for piezoelectric transducers applications．In these applications，the sensors generate an amount of electric charge proportional to the changes in the mechanical stress applied to them．These charges are transformed into a voltage proportional to the applied force by injecting them into a capacitance and then amplifying the resulting voltage．The voltage is an inverse function of the capacitance into which the charges generated by the transducer／sensor are injected．This capacitance and the resistance that dis－ charges it，define the low－frequency response of the circuit．It is desirable，once the preferred low－frequency response is known，to maintain the capacitance as low as possible，because the amount of necessary upstream amplification（and the signal－to－noise ratio deterioration）is directly proportional to the capacitance value．The MAX4236／MAX4237 high－impedance，low－

## SOT23, Very High Precision, 3V/5V Rail-To-Rail Op Amps

current, low-noise inputs allow a minimum of capacitance to be used.
Piezoresistive transducers applications require many of the same qualities. For those applications the MAX4236/MAX4237 high CMRR, PSRR, and offset stability are also a good match.
A typical application for a piezoresistive transducer instrumentation amplifier design using the MAX4236/MAX4237 is shown in the Typical Application Circuit.

In general, the MAX4236/MAX4237 are good components for any application in which an amplifier with an almost zero input current is required, including highprecision, long time-constant integrators and electrochemical sensors.

Power Supplies
The MAX4236/MAX4237 can operate from a single +2.4 V to +5.5 V power supply, or from $\pm 1.2 \mathrm{~V}$ to $\pm 2.75 \mathrm{~V}$ power supplies. The power supply pin(s) must be bypassed to ground with a $0.1 \mu \mathrm{~F}$ capacitor as close to the pin as possible.

## Layout and Physical Design

A good layout improves performance by decreasing the amount of parasitic and stray capacitance, inductance and resistance at the amplifier's inputs, outputs, and power-supply connections. Since parasitics might be unavoidable, minimize trace lengths, resistor leads, and place external components as close to the pins as possible.
In high impedance, low input current applications, input lines guarding and shielding, special grounding, and other physical design and layout techniques, are mandatory if good results are expected.
The negative effects of crosstalk, EMI and other forms of interference and noise (thermal, acoustic, etc.) must be accounted for and prevented beforehand for good performance in the type of sensitive circuitry in which the MAX4236/MAX4237 are likely to be used.
