# Fast, Low-Voltage, $4 \Omega$, 4-ChanneI CMOS Analog Multiplexer 

#### Abstract

General Description The MAX4634 fast, low-voltage, 4-channel CMOS analog multiplexer features $4 \Omega$ (max) on-resistance (RON). It offers RON matching between switches to $0.3 \Omega$ (max) and RoN flatness of $1 \Omega$ (max) over the specified signal range. Each switch can handle V+ to GND analog signals. Off-leakage current is only 0.1 nA (max) at $+25^{\circ} \mathrm{C}$. The MAX4634 features fast turn-on (tON) and turn-off (toff) times of 18 ns and 11 ns , respectively. All this comes in the tiny 10-pin $\mu \mathrm{MAX}{ }^{\circledR}$ and 10 -pin, $3 \mathrm{~mm} \times$ 3mm, TDFN packages. This low-voltage multiplexer operates from $\mathrm{a}+1.8 \mathrm{~V}$ to +5.5 V single supply. All digital inputs have +0.8 V and +2.4 V logic thresholds, ensuring TTL/CMOS-logic compatibility with +5 V operation.

$\mu M A X$ is a registered trademark of Maxim Integrated Products, Inc.

|  |  |
|  |  |

Note 1: Signals on NO_, COM, EN, or A_ exceeding V+ or GND are clamped by internal diodes. Limit forward diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2: The algebraic convention, where the most negative value is a minimum and the most positive value a maximum, is used in this data sheet.
Note 3: TDFN parts are tested at $+25^{\circ} \mathrm{C}$ and guaranteed by design and correlation over the entire temperature range.
Note 4: $\Delta \operatorname{Ron}=\operatorname{RON}(M A X)-\operatorname{RON}(\mathrm{MIN})$.
Note 5: RON and $\Delta$ Ron matching specifications for TDFN-packaged parts are guaranteed by design.
Note 6: Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal ranges.
Note 7: Guaranteed by design.
Note 8: Off-isolation $=20 \log _{10}\left(\mathrm{~V}_{\mathrm{COM}} / \mathrm{V}_{\mathrm{NO}}\right)$, where $\mathrm{V}_{\mathrm{COM}}=$ output and $\mathrm{V}_{\mathrm{NO}}=$ input to off switch.
Note 9: Between any two switches.

Typical Operating Characteristics
( $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted.)

## Fast, Low-Voltage, 4 ${ }^{2}$, 4-Channel CMOS Analog Multiplexer

Pin Description

| PIN | NAME | FUNCTION |
| :---: | :---: | :---: |
| $\mu$ MAX／ <br> TDFN |  |  |
| 1 | A0 | Address Input．See the Truth Table for details． |
| 2 | NO1 | Normally Open Switch 1 |
| 3 | GND | Ground |
| 4 | NO3 | Normally Open Switch 3 |
| 5 | EN | Enable Logic Input．See the Truth Table for details． |
| 6 | V＋ | Positive Supply Voltage．Connect to an external power supply． Bypass to GND with a $10 \mu \mathrm{~F}$ capacitor placed as close to the pin as possible． |
| 7 | NO4 | Normally Open Switch 4 |
| 8 | COM | Analog Switch Common Terminal |
| 9 | NO2 | Normally Open Switch 2 |
| 10 | A1 | Address Input．See the Truth Table for details． |
| － | EP | Exposed Pad．Internally connected to GND．Connect to a large PCB ground plane for proper operation． Not intended as an electrical connection point（TDFN package only）． |

## Detailed Description

The MAX4634 is a low－on－resistance，low－voltage ana－ log multiplexer that operates from $\mathrm{a}+1.8 \mathrm{~V}$ to +5.5 V sin－ gle supply．CMOS switch construction allows pro－ cessing of analog signals that are within the supply volt－ age range（GND to $\mathrm{V}+$ ）．
To disable all switch channels，drive EN low．All four inputs and COM become high impedance during this state．If the disable feature is not needed，connect EN to $\mathrm{V}+$ ．

Figure 1．Overvoltage Protection Using External Blocking Diodes

## Applications Information <br> Power－Supply Sequencing and Overvoltage Protection

Proper power－supply sequencing is recommended for all CMOS devices．Always apply V＋before applying analog signals or logic inputs，especially if the analog or logic signals are not current limited．If this sequencing is not possible，and if the analog or logic inputs are not current limited to $<20 \mathrm{~mA}$ ，add a small－signal diode （D1）as shown in Figure 1．If the analog signal can dip below GND，add D2．Adding protection diodes reduces the analog signal range to a diode drop（about 0.7 V ） below $\mathrm{V}+$ for D 1 or to a diode drop above ground for D 2 ． The addition of diodes does not affect leakage．On－resis－ tance increases by a small amount at low supply voltages． Maximum supply voltage（ $\mathrm{V}+$ ）must not exceed 6V．
Protection diodes D1 and D2 also protect against some overvoltage situations．A fault voltage up to the absolute maximum rating at an analog signal input does not damage the device，even if the supply voltage is below the signal voltage．

## Fast, Low-Voltage, 4 $\Omega$, 4-Channel CMOS Analog Multiplexer

| PACKAGE TYPE | PACKAGE CODE | DOCUMENT NO. |
| :---: | :---: | :---: |
| $10 \mu \mathrm{MAX}$ | - | $\underline{\mathbf{2 1 - 0 0 6 1}}$ |
| 10 TDFN | $\mathrm{T} 1033-1$ | $\underline{\mathbf{2 1 - 0 1 3 7}}$ |

## Fast, Low-Voltage, 4 , 4-Channel CMOS Analog Multiplexer

| Revision History |  |  |  |
| :---: | :---: | :--- | :---: |
| REVISION <br> NUMBER | REVISION <br> DATE | DESCRIPTION | PAGES <br> CHANGED |
| 0 | $4 / 00$ | Initial release | - |
| 1 | $2 / 02$ | Added QFN package | - |
| 2 | $5 / 03$ | Added QFN packaging information | - |
| 3 | $2 / 09$ | Added TDFN package information (replaced QFN), style edits | 1,7 |
