Low-Charge-Injection, 8-Channel, High-Voltage Analog Switches with 20MHz Serial Interface

General Description

The MAX4800A/MAX4802A provide high-voltage switching on eight channels for ultrasonic imaging and printer applications. The devices utilize BCDMOS process technology to provide eight high-voltage low-charge-injection SPST switches, controlled by a 20MHz serial interface. Data is clocked into an internal 8-bit shift register and retained by a programmable latch with enable and clear inputs. A power-on reset function ensures that all switches are open on power-up.

The devices operate with a wide range of high-voltage supplies including: $V_{PP}/V_{NN} = +100V/-100V$, +185V/-15V, and +40V/-160V. The digital interface operates from a separate V_{DD} supply from +2.7V to +6V. Digital inputs DIN, CLK, LE, and CLR are +6V tolerant, independent of the V_{DD} supply voltage. The MAX4802A provides integrated $35k\Omega$ bleed resistors on each switch terminal to discharge capacitive loads.

The devices are drop-in replacements for the Supertex HV2203 and HV2303. They are available in the 48-pin LQFP, 26-bump CSBGA, and 28-pin PLCC packages. All devices are specified for the commercial 0°C to +70°C temperature range.

Applications

- Ultrasound Imaging
- Printers

Features

- Fast SPI™ Interface 20MHz
- Pin-Compatible Replacement for Supertex HV2203 (MAX4800A)
- Pin-Compatible Replacement for Supertex HV2303 (MAX4802A)
- Flexible High-Voltage Supplies Up to V_{PP} V_{NN} = 200V
- Low-Charge-Injection, Low-Capacitance 22Ω Switches
- DC to 50MHz Analog-Signal Frequency Range
- -77dB Off-Isolation at 5MHz
- Low 10µA Quiescent Current
- Integrated Bleed Resistors (MAX4802A Only)
- Available in Standard PLCC, LQFP, and CSBGA Packages

SPI is a trademark of Motorola, Inc.

Low-Charge-Injection, 8-Channel, High-Voltage Analog Switches with 20MHz Serial Interface

Absolute Maximum Ratings

| (All voltages referenced to GND.) | |
|--|------------------------------------|
| V _{DD} Logic Supply Voltage | 0.3V to +7V |
| V _{PP} - V _{NN} Supply Voltage | 220V |
| VPP Positive Supply Voltage | 0.3V to (V _{NN} + 220V) |
| V _{NN} Negative Supply Voltage | +0.3V to -220V |
| Logic Inputs IE, CLR, CLK, DIN | 0.3V to +7V |
| DOUT | 0.3V to (V _{DD} + 0.3V) |
| RGND (MAX4802A) | 4.5V to +0.3V |
| COM_, NO | V _{NN} to V _{PP} |
| | |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Information

| Junction to Case (θ _{JC}) | 10°C/W | | | | | | | |

For the latest package outline information and land patterns (footprints), go to <u>www.maximintegrated.com/packages</u>. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to <u>www.maximintegrated.com/thermal-tutorial</u>.

Note 1: Specifications at 0°C are guaranteed by correlation and design.

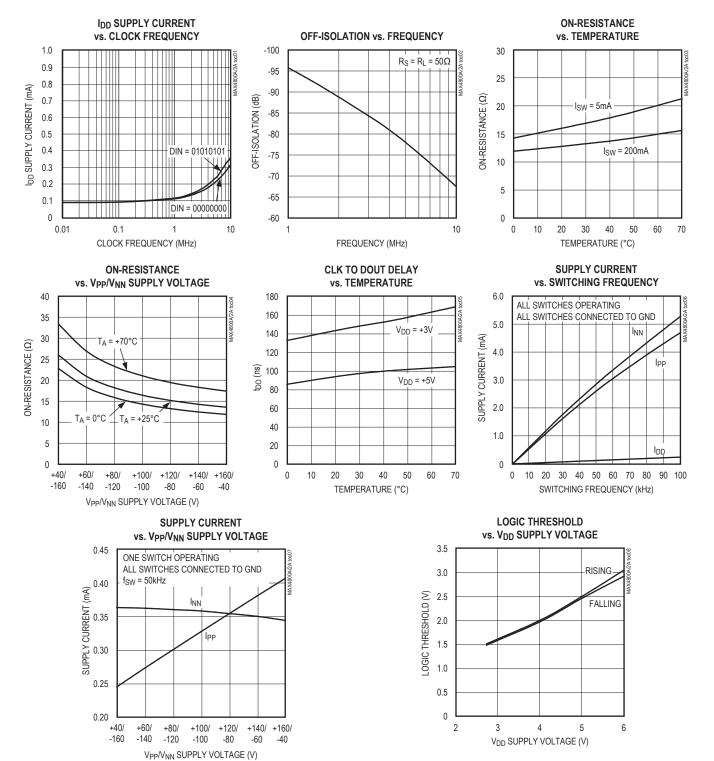

Note 2: The analog-signal input V_{COM} and V_{NO} must satisfy $V_{NN} \le (V_{COM}, V_{NO}) \le V_{PP}$, or remain unconnected during power-up and power-down.

Note 3: Guaranteed by design and characterization; not production tested.

Low-Charge-Injection, 8-Channel, High-Voltage Analog Switches with 20MHz Serial Interface

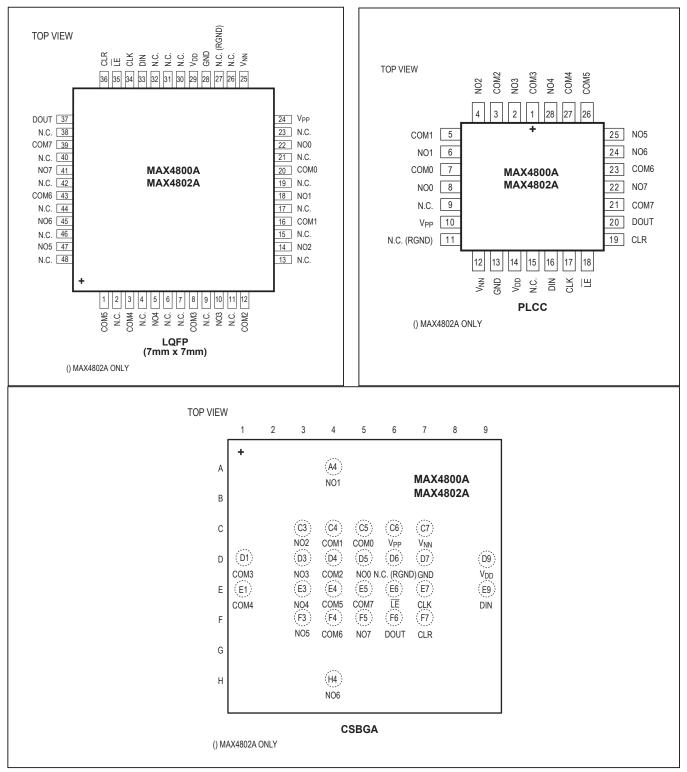

Typical Operating Characteristics

Low-Charge-Injection, 8-Channel, High-Voltage Analog Switches with 20MHz Serial Interface

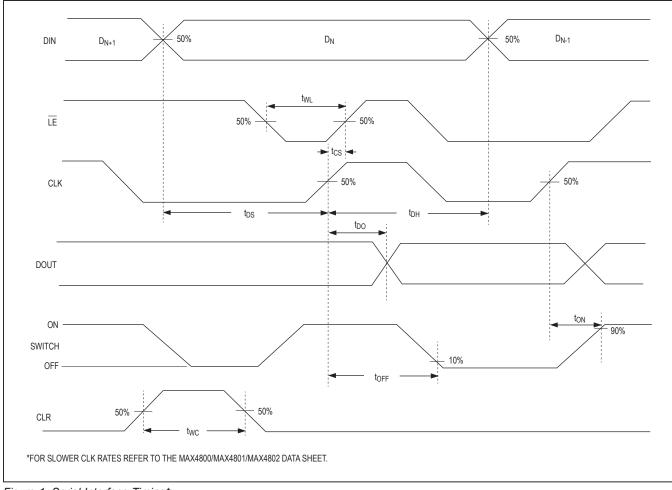

Figure 1. Serial Interface Timing*

Detailed Description

The MAX4800A/MAX4802A provide high-voltage switching on eight channels for ultrasound imaging and printer applications. The devices utilize BCDMOS process technology to provide eight high-voltage low-charge-injection SPST switches, controlled by a 20MHz serial interface. Data is clocked into an internal 8-bit shift register and retained by a programmable latch with enable and clear inputs. A power-on reset function ensures that all switches are open on power-up.

The devices operate with a wide range of high-voltage supplies including: $V_{PP}/V_{NN} = +100V/-100V$, +185V/-15V, or +40V/-160V. The digital interface operates from a separate V_{DD} supply from +2.7V to +6V. Digital inputs DIN, CLK, \overline{LE} , and CLR are +6V tolerant, independent of the V_{DD} supply voltage. The MAX4802A provides

integrated $35k\Omega$ bleed resistors on each switch terminal to discharge capacitive loads.

The devices are drop-in replacements for the Supertex HV2203 and HV2303, respectively.

Analog Switch

The devices allow a peak-to-peak analog-signal range from V_{NN} + 10V to V_{PP} - 10V. Analog switch inputs must be unconnected, or satisfy V_{NN} \leq (V_{COM_}, V_{NO_}) \leq V_{PP} during power-up and power-down.

High-Voltage Supplies

The devices allow a wide range of high-voltage supplies. The devices operate with V_{NN} from -160V to -15V and V_{PP} from +40V to (V_{NN} + 200V). When V_{NN} is connected to GND (single-supply applications), the devices operate with V_{PP} up to +200V.

Low-Charge-Injection, 8-Channel, High-Voltage Analog Switches with 20MHz Serial Interface

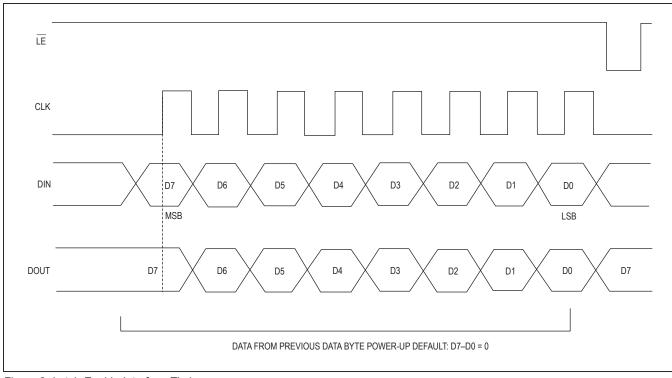

Figure 2. Latch-Enable Interface Timing

The V_{PP} and V_{NN} high-voltage supplies are not required to be symmetrical, but the voltage difference V_{PP} - V_{NN} must not exceed 200V.

Bleed Resistors (MAX4802A)

The MAX4802A features integrated $35k\Omega$ bleed resistors to discharge capacitive loads such as piezoelectric transducers. Each analog-switch terminal is connected to RGND with a bleed resistor.

Serial Interface

The devices are controlled by a serial interface with an 8-bit serial shift register and transparent latch. Each of the eight data bits controls a single analog switch (see Table 1). Data on DIN is clocked with the most significant bit (MSB) first into the shift register on the rising edge of CLK. Data is clocked out of the shift register onto DOUT on the rising edge of CLK. DOUT reflects the status of DIN, delayed by eight clock cycles (see Figures 1 and 2).

Latch Enable (LE)

Drive \overline{LE} logic-low to change the contents of the latch and update the state of the high-voltage switches (Figure 2). Drive \overline{LE} logic-high to freeze the contents of the latch and prevent changes to the switch states. To reduce noise due to clock feedthrough, drive \overline{LE} logic-high while data is clocked into the shift register. After the data shift register is loaded with valid data, pulse \overline{LE} logic-low to load the contents of the shift register into the latch.

Latch Clear (CLR)

The devices feature a latch clear input. Drive CLR logic-high to reset the contents of the latch to zero and open all switches. CLR does not affect the contents of the data shift register. Pulse $\overline{\text{LE}}$ logic-low to reload the contents of the shift register into the latch.

Power-On Reset

The devices feature a power-on reset circuit to ensure all switches are open at power-on. The internal 8-bit serial shift register and latch are set to zero on power-up.

Table 1. Serial Interface Programming

X = Don't care.

Applications Information

Logic Levels

The devices' digital interface inputs CLK, DIN, $\overline{\text{LE}}$, and CLR are tolerant of up to +6V, independent of the V_{DD} supply voltage, allowing compatibility with higher voltage controllers.

Daisy Chaining Multiple Devices

Digital output DOUT is provided to allow the connection of multiple devices by daisy-chaining (Figure 3). Connect each DOUT to the DIN of the subsequent device in the chain. Connect CLK, \overline{LE} , and CLR inputs of all devices, and drive \overline{LE} logic-low to update all devices simultaneously. Drive CLR high to open all the switches simultaneously. Additional shift registers may be included anywhere in series with the MAX4800A/MAX4802A data chain.

Supply Sequencing and Bypassing

The devices do not require special sequencing of the V_{DD}, V_{PP}, and V_{NN} supply voltages; however, analog switch inputs must be unconnected, or satisfy V_{NN} \leq (V_{COM_}, V_{NO_}) \leq V_{PP} during power-up and power-down. Bypass V_{DD}, V_{NN}, and V_{PP} to GND with a 0.1µF ceramic capacitor as close to the device as possible.
