

0.75Ω, Dual SPDT Audio Switch with Integrated Comparators

MAX4855

General Description

The MAX4855 dual, single-pole/double-throw (SPDT) switch operates from a single +2V to +5.5V supply and features rail-to-rail signal handling. The MAX4855 has low on-resistance (0.75Ω) with a +3V supply making it ideal for audio switching applications in portable devices. The device also integrates two internal comparators that can be used for headphone detection or mute/send key functions.

The MAX4855 is available in the space-saving (3mm x 3mm), 16-pin thin QFN package and operates over the extended temperature range of -40°C to +85°C.

Applications

- Speaker Headset Switching
- Audio-Signal Routing
- Cellular Phones
- Notebook Computers
- PDA's and Other Handheld Devices

Features

- ◆ **Audio Signal Routing**
- ◆ **0.75Ω On-Resistance**
- ◆ **0.18Ω On-Resistance Flatness**
- ◆ **0.07Ω Channel-to-Channel Matching**
- ◆ **Rail-to-Rail Signal Handling**
- ◆ **2 Integrated Comparators**
- ◆ **1.8V Logic Compatible**
- ◆ **2V to 5.5V Supply Range**
- ◆ **Available in a Space-Saving (3mm x 3mm), 16-Pin TQFN Package**

Note 1: Signals on NO, NC, or COM exceeding V_{CC} or GND are clamped by internal diodes. Signals on IN exceeding GND are clamped by an internal diode. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Detailed Description

The MAX4855 dual SPDT, low on-resistance, low-voltage, analog switch operates from a +2V to +5.5V supply and can handle signals up to the power rails. In addition, the MAX4855 integrates two internal comparators that can be used for headphone or mute detection. The comparator threshold is internally generated to be approximately 1/3 of V_{CC}.

Applications Information

Digital Control Inputs

The logic inputs (IN_n) accept up to +5.5V even if the supply voltages are below this level. For example, with a +3.3V V_{CC} supply, IN_n can be driven low to GND and high to +5.5V allowing for mixing of logic levels in a system. Driving IN_n rail-to-rail minimizes power consumption. For a +2V supply voltage, the logic thresholds are 0.5V (low) and 1.4V (high); for a +5V supply voltage, the logic thresholds are 0.8V (low) and 1.8V (high).

Analog Signal Levels

The on-resistance of these switches changes very little for analog input signals across the entire supply voltage range (see the *Typical Operating Characteristics*). The switches are bidirectional, so the NO_n, NC_n, and COM_n pins can be either inputs or outputs.

Comparator

The positive terminal of the comparator is internally set to V_{CC}/3. When the negative terminal (CIN_n) is below the threshold (V_{CC}/3), the comparator output (COOUT_n) is high. When CIN_n rises above V_{CC}/3, COOUT_n is low.

The comparator threshold allows for detection of headphones since headphone audio signals are typically biased to V_{CC}/2.

Power-Supply Sequencing

Caution: Do not exceed the absolute maximum ratings because stresses beyond the listed ratings may cause permanent damage to the device.

Proper power-supply sequencing is recommended for all CMOS devices. Always apply V_{CC} before applying analog signals, especially if the analog signal is not current-limited.
