10/100/1000 Base-T Ethernet LAN Switch

General Description

The MAX4890/MAX4891/MAX4892 high-speed analog switches meet the needs of 10/100/1000 Base-T applications. These devices switch the signals from two interface transformers and connect the signals to a single 10/100/1000 Base-T Ethernet PHY, simplifying docking station design and reducing manufacturing costs. The MAX4890/MAX4891/MAX4892 can also route signals from a common interface transformer to two different boards in board-redundancy applications.

The MAX4890/MAX4891/MAX4892 switches provide an extremely low capacitance and on-resistance to meet Ethernet insertion and return-loss specifications. The MAX4891/MAX4892 feature one and three built-in LED switches, respectively.

The MAX4890/MAX4891/MAX4892 are available in space-saving 32- and 36-lead TQFN packages, significantly reducing the required PC board area. These devices operate over the -40°C to +85°C temperature range.

Features

- **Single +3.0V to +3.6V Power-Supply Voltage**
- **Low On-Resistance (R_{ON}): 4Ω (typ), 6.5Ω (max)**
- **Ultra-Low On-Capacitance (C_{ON}): 6.5pF (typ)**
- **Low < 200ps Bit-to-Bit Skew**
- **-3dB Bandwidth: 1GHz**
- **Optimized Pin-Out for Easy Transformer and PHY Interface**
- **Built-In LED Switches for Switching Indicators to Docking Station**
- **Low 450µA (max) Quiescent Current**
- **Bidirectional 8 to 16 Multiplexer/Demultiplexer**
- **Space-Saving Packages**
  32-Pin, 5mm x 5mm, TQFN Package
  36-Pin, 6mm x 6mm, TQFN Package

Note 1: Signals on SEL, exceeding V+ or GND, are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Detailed Description

The MAX4890/MAX4891/MAX4892 are high-speed analog switches targeted for 10/100/1000 Base-T applications. In a typical application, the MAX4890/MAX4891/MAX4892 switch the signals from two separate interface transformers and connect the signals to a single 10/100/1000 Base-T Ethernet PHY (see the *Typical Operating Circuit*). This configuration simplifies docking station design by avoiding signal reflections associated with unterminated transmission lines in a T configuration. The MAX4891 and MAX4892 also include LED switches that allow the LED output signals to be routed to a docking station along with the Ethernet signals. See the *Functional Diagrams.*

The MAX4890/MAX4891/MAX4892 switches provide an extremely low capacitance and on-resistance to meet Ethernet insertion and return-loss specifications. The MAX4891/MAX4892 feature one and three built-in LED switches, respectively.

The MAX4890/MAX4891/MAX4892 incorporate a unique architecture design utilizing only n-channel switches within the main Ethernet switch, reducing I/O capacitance and channel resistance. An internal two-stage charge pump with a nominal output of 7.5V provides the high voltage needed to drive the gates of the n-channel switches, while maintaining a consistently low R_{ON} throughout the input signal range. An internal bandgap reference set to 1.23V and an internal oscillator running at 2.5MHz provide proper charge-pump operation. Unlike other charge-pump circuits, the MAX4890/MAX4891/MAX4892 include internal flyback capacitors, reducing design time, board space, and cost.

Digital Control Inputs

The MAX4890/MAX4891/MAX4892 provide a single digital control SEL. SEL controls the switches as well as the LED switches as shown in Table 1.

Table 1. Truth Table

SEL	CONNECTION
0	A_ to _B1, LED_ to _LED1
1	A_ to _B2, LED_ to _LED2

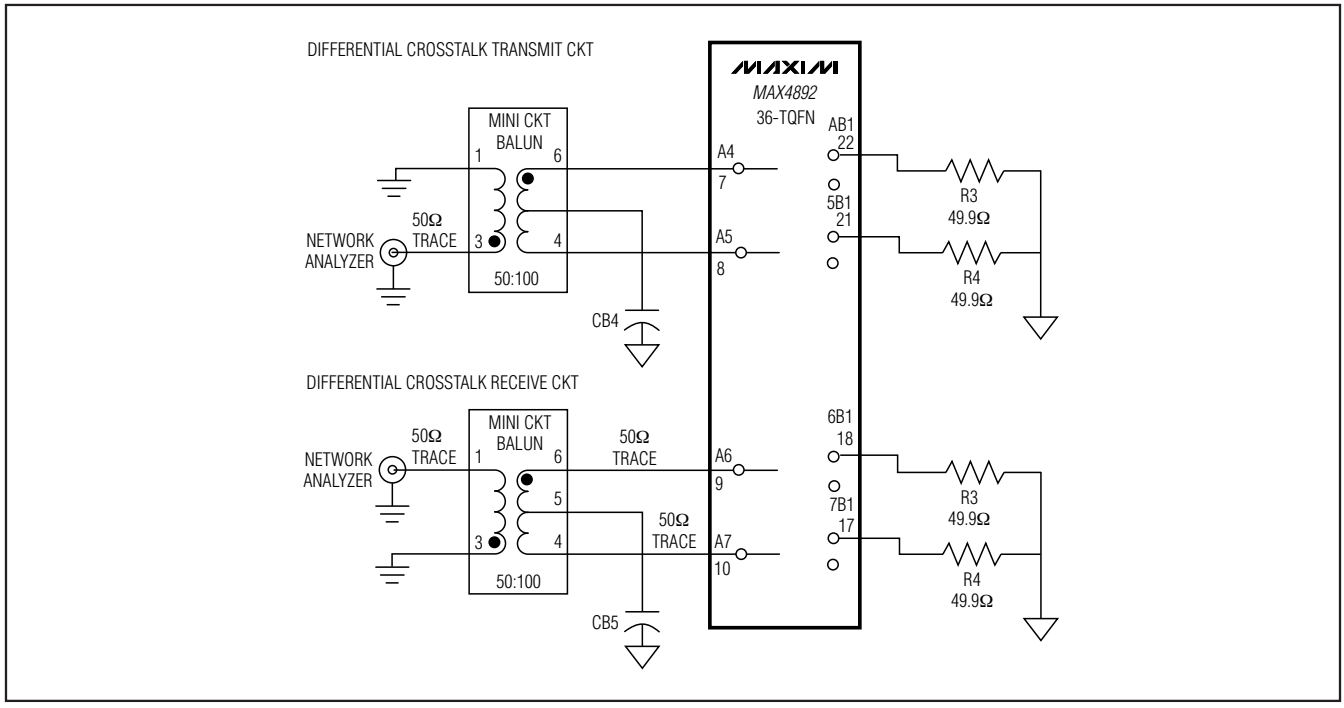

Figure 4. Differential Crosstalk

Analog Signal Levels

The on-resistance of the MAX4890/MAX4891/MAX4892 is very low and stable as the analog input signals are swept from ground to V+ (see the *Typical Operating Characteristics*). The switches are bidirectional, allowing A_ and _B_ to be configured as either inputs or outputs.

ESD Protection

The MAX4890/MAX4891/MAX4892 are characterized using the Human Body Model for ±2kV of ESD protection. Figure 8 shows the Human Body Model, and Figure 9 shows the current waveform the Human Body Model generates when discharged into a low-impedance load. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a 1.5kΩ resistor.

Applications Information

Typical Operating Circuit

The *Typical Operating Circuit* depicts the MAX4890/MAX4891/MAX4892 in a 10/100/1000 Base-T docking station application.

Line-Card Redundancy (Ethernet T3/E3)

Figure 10 shows the MAX4890/MAX4891/MAX4892 in a line-card redundancy configuration.

Power-Supply Sequencing and Overvoltage Protection

Caution: Do not exceed the absolute maximum ratings. Stresses beyond the listed ratings may cause permanent damage to the device.

Proper power-supply sequencing is recommended for all CMOS devices. Always apply V+ before applying analog signals, especially if the analog signal is not current limited.

Layout

High-speed switches require proper layout and design procedures for optimum performance. Keep design-controlled-impedance printed circuit board traces as short as possible. Ensure that bypass capacitors are as close to the device as possible. Use large ground planes where possible.
