

## Low-Power, Dual, Voltage-Output, 12-Bit DAC with Serial Interface

MAX5104

### General Description

The MAX5104 low-power, serial, voltage-output, dual 12-bit digital-to-analog converter (DAC) consumes only 500 $\mu$ A from a single +5V supply. This device features Rail-to-Rail<sup>®</sup> output swing and is available in a space-saving 16-pin QSOP package. To maximize the dynamic range, the DAC output amplifiers are configured with an internal gain of +2V/V.

The 3-wire serial interface is SPI<sup>™</sup>/QSPI<sup>™</sup>/MICROWIRE<sup>™</sup> compatible. Each DAC has a double-buffered input organized as an input register followed by a DAC register, which allows the input and DAC registers to be updated independently or simultaneously with a 16-bit serial word. Additional features include programmable power-down (2 $\mu$ A), hardware power-down lockout (PDL), a separate reference voltage input for each DAC that accepts AC and DC signals, and an active-low clear input (CL) that resets all registers and DACs to zero. These devices provide a programmable logic pin for added functionality, and a serial-data output pin for daisy chaining.

### Applications

Industrial Process Control  
 Remote Industrial Controls  
 Digital Offset and Gain Adjustment  
 Microprocessor-Controlled Systems  
 Motion Control  
 Automatic Test Equipment (ATE)

### Features

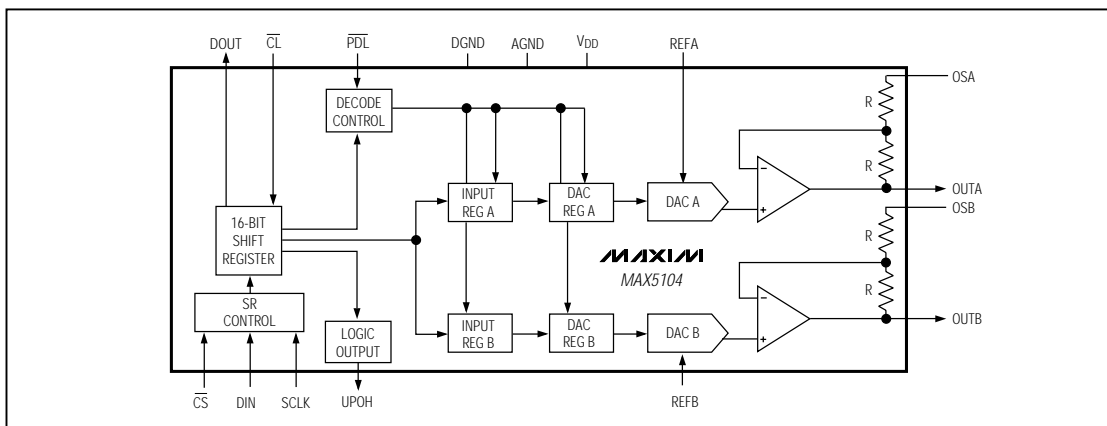

- ◆ 12-Bit Dual DAC with Internal Gain of +2V/V
- ◆ Rail-to-Rail Output Swing
- ◆ 12 $\mu$ s Settling Time
- ◆ +5V Single-Supply Operation
- ◆ Low Quiescent Current  
500 $\mu$ A (normal operation)  
2 $\mu$ A (power-down mode)
- ◆ SPI/QSPI/MICROWIRE Compatible
- ◆ Space-Saving 16-Pin QSOP Package
- ◆ Power-On Reset Clears Registers and DACs to Zero
- ◆ Adjustable Output Offset

### Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE	INL (LSB)
MAX5104CEE	0°C to +70°C	16 QSOP	$\pm 4$
MAX5104EEE	-40°C to +85°C	16 QSOP	$\pm 4$

Pin Configuration appears at end of data sheet.

8	SCLK	Serial-Clock Input
9	DGND	Digital Ground
10	DOUT	Serial-Data Output
11	UPO	User-Programmable Output
12	$\overline{\text{PDL}}$	Power-Down Lockout. The device cannot be powered down when $\overline{\text{PDL}}$ is low.
13	REFB	Reference for DAC B
14	OSB	DAC B Offset Adjustment
15	OUTB	DAC B Output Voltage
16	VDD	Positive Power Supply

## Detailed Description

The MAX5104 dual, 12-bit, voltage-output DAC is easily configured with a 3-wire serial interface. The device includes a 16-bit data-in/data-out shift register, and each DAC has a double-buffered input composed of an input register and a DAC register (see *Functional Diagram*). In addition, trimmed internal resistors produce an internal gain of  $+2V/V$  that maximizes output voltage swing. The amplifier's offset-adjust pin allows for a DC shift in the DAC's output.

Both DACs use an inverted R-2R ladder network that produces a weighted voltage proportional to the input voltage value. Each DAC has its own reference input to facilitate independent full-scale values. Figure 1 depicts a simplified circuit diagram of one of the two DACs.

### Reference Inputs

The reference inputs accept both AC and DC values with a voltage range extending from 0 to  $(V_{DD} - 1.4V)$ .

Determine the output voltage using the following equation ( $OS_+ = AGND$ ):

Figure 1. Simplified DAC Circuit Diagram

$$V_{OUT} = (V_{REF} \cdot NB / 4096) \cdot 2$$

where NB is the numeric value of the DAC's binary input code (0 to 4095) and  $V_{REF}$  is the reference voltage.

The reference input impedance ranges from 14k $\Omega$  (1554 hex) to several gigohms (with an input code of 0000 hex). The reference input capacitance is code dependent and typically ranges from 15pF with an input code of all zeros to 50pF with a full-scale input code.

### Output Amplifier

The MAX5104's output amplifiers have internal resistors that provide for a gain of  $+2V/V$  when  $OS_+$  is connected to AGND. These resistors are trimmed to minimize gain error. The output amplifiers have a typical slew rate of 0.75V/ $\mu$ s and settle to 1/2LSB within 15 $\mu$ s, with a load of 10k $\Omega$  in parallel with 100pF. Loads less than 2k $\Omega$  degrade performance.

The  $OS_+$  pin can be used to produce an adjustable offset voltage at the output. For instance, to achieve a 1V offset, apply -1V to the  $OS_+$  pin to produce an output range from 1V to  $(1V + V_{REF} \cdot 2)$ . Note that the DAC's output range is still limited by the maximum output voltage specification.

### Power-Down Mode

The MAX5104 features a software-programmable shutdown mode that reduces the typical supply current to 2 $\mu$ A. The two DACs can be powered down independently, or simultaneously using the appropriate programming command. Enter power-down mode by writing the appropriate input-control word (Table 1). In power-down mode, the reference inputs and amplifier outputs become high impedance, and the serial interface remains active. Data in the input registers is saved,

# Low-Power, Dual, Voltage-Output, 12-Bit DAC with Serial Interface

MAX5104

**Table 1. Serial-Interface Programming Commands**

16-BIT SERIAL WORD					FUNCTION
A0	C1	C0	D11.....D0 (MSB) (LSB)	S0	
0	0	1	12-bit DAC data	0	Load input register A; DAC registers are unchanged.
1	0	1	12-bit DAC data	0	Load input register B; DAC registers are unchanged.
0	1	0	12-bit DAC data	0	Load input register A; all DAC registers are updated.
1	1	0	12-bit DAC data	0	Load input register B; all DAC registers are updated.
0	1	1	12-bit DAC data	0	Load all DAC registers from the shift register (start up both DACs with new data).
1	0	0	XXXXXXXXXX	0	Update both DAC registers from their respective input registers (start up both DACs with data previously stored in the input registers).
1	1	1	XXXXXXXXXX	0	Shut down both DACs (provided $\overline{PDL} = 1$ ).
0	0	0	0 0 1 X XXXXXXXX	0	Update DAC register A from input register A (start up DAC A with data previously stored in input register A).
0	0	0	1 0 1 X XXXXXXXX	0	Update DAC register B from input register B (start up DAC B with data previously stored in input register B).
0	0	0	1 1 0 X XXXXXXXX	0	Power Down DAC A (provided $\overline{PDL} = 1$ ).
0	0	0	1 1 1 X XXXXXXXX	0	Power Down DAC B (provided $\overline{PDL} = 1$ ).
0	0	0	0 1 0 X XXXXXXXX	0	UPO goes low (default).
0	0	0	0 1 1 X XXXXXXXX	0	UPO goes high.
0	0	0	1 0 0 1 XXXXXXXX	0	Mode 1, DOUT clocked out on SCLK's rising edge.
0	0	0	1 0 0 0 XXXXXXXX	0	Mode 0, DOUT clocked out on SCLK's falling edge (default).
0	0	0	0 0 0 X XXXXXXXX	0	No operation (NOP).

X = Don't care

**Note:** D11, D10, D9, and D8 become control bits when A0, C1, and C0 = 0. S0 is a sub-bit, always zero.

allowing the MAX5104 to recall the output state prior to entering power-down when returning to normal mode. Exit power-down by recalling the previous condition or by updating the DAC with new information. When returning to normal operation (exiting power-down), wait 20µs for output stabilization.

### Serial Interface

The MAX5104's 3-wire serial interface is compatible with both MICROWIRE (Figure 2) and SPI/QSPI (Figure 3) serial-interface standards. The 16-bit serial input word consists of 1 address bit, 2 control bits, 12 bits of data (MSB to LSB), and 1 sub-bit as shown in Figure 4. The address and control bits determine the MAX5104's response, as outlined in Table 1.

Figure 2. Connections for MICROWIRE

# Low-Power, Dual, Voltage-Output, 12-Bit DAC with Serial Interface

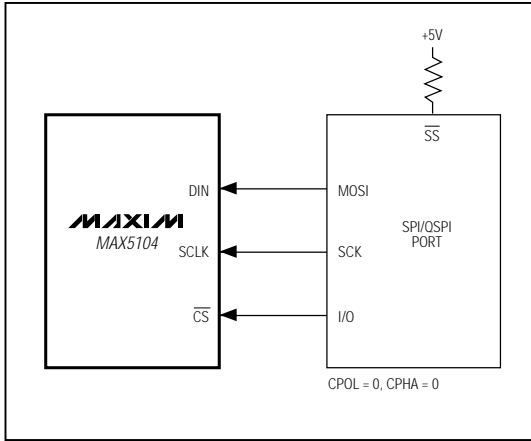

Figure 3. Connections for SPI/QSPI

The MAX5104's digital inputs are double buffered, which allows any of the following: loading the input register(s) without updating the DAC register(s), updating the DAC register(s) from the input register(s), or updating the input and DAC registers concurrently. The address and control bits allow the DACs to act independently. Send the 16-bit data as one 16-bit word (QSPI) or two 8-bit packets (SPI, MICROWIRE), with  $\overline{CS}$  low during this period. The address and control bits determine which register will be updated, and the state of the registers when exiting power-down. The 3-bit address/control determines the following:

- Registers to be updated
- Clock edge on which data is to be clocked out via the serial-data output (DOUT)
- State of the user-programmable logic output
- Configuration of the device after power-down

The general timing diagram of Figure 5 illustrates how data is acquired. Driving  $\overline{CS}$  low enables the device to receive data; otherwise, the interface control circuitry is disabled. With  $\overline{CS}$  low, data at DIN is clocked into the register on the rising edge of SCLK. As  $\overline{CS}$  goes high, data is latched into the input and/or DAC registers, depending on the address and control bits. The maximum clock frequency guaranteed for proper operation is 10MHz. Figure 6 shows a more detailed timing diagram of the serial interface.

# Low-Power, Dual, Voltage-Output, 12-Bit DAC with Serial Interface

### Serial-Data Output

The serial-data output, DOUT, is the internal shift register's output. DOUT allows for daisy chaining of devices and data readback. The MAX5104 can be programmed to shift data out of DOUT on SCLK's falling edge (Mode 0) or on the rising edge (Mode 1). Mode 0 provides a lag of 16 clock cycles, which maintains compatibility with SPI/QSPI and MICROWIRE interfaces. In Mode 1, the output data lags 15.5 clock cycles. On power-up, the device defaults to Mode 0.

### User-Programmable Logic Output

User-programmable logic output (UPO) allows an external device to be controlled through the serial interface (Table 1), thereby reducing the number of microcontroller I/O pins required. On power-up, UPO is low.

### Power-Down Lockout Input

The power-down lockout (PDL) pin disables software shutdown when low. When in power-down, transitioning PDL from high to low wakes up the part with the output set to the state prior to power-down. PDL can also be used to asynchronously wake up the device.

### Daisy-Chaining Devices

Any number of MAX5104s can be daisy-chained by connecting the DOUT pin of one device to the DIN pin of the following device in the chain (Figure 7).

Since the MAX5104's DOUT pin has an internal active pull-up, the DOUT sink/source capability determines the time required to discharge/charge a capacitive load. See the digital output  $V_{OH}$  and  $V_{OL}$  specifications in the *Electrical Characteristics*.

Figure 8 shows an alternate method of connecting several MAX5104s. In this configuration, the data bus is common to all devices; data is not shifted through a daisy chain. More I/O lines are required in this configuration because a dedicated chip-select input ( $\overline{CS}$ ) is required for each IC.

## Applications Information

### Unipolar Output

Figure 9 shows the MAX5104 configured for unipolar, rail-to-rail operation with a gain of +2V/V. The MAX5104 can produce a 0 to 4.096V output with a 2.048V reference (Figure 9). Table 2 lists the unipolar output codes. An offset to the output can be achieved by connecting a voltage to  $OS_{-}$ , as shown in Figure 10. By applying  $V_{OS_{-}} = -1V$ , the output values will range between 1V and  $(1V + V_{REF} \cdot 2)$ .

### Bipolar Output

The MAX5104 can be configured for a bipolar output (Figure 11). The output voltage is given by the equation ( $OS_{-} = AGND$ ):

Figure 9. Unipolar Output Circuit (Rail-to-Rail)

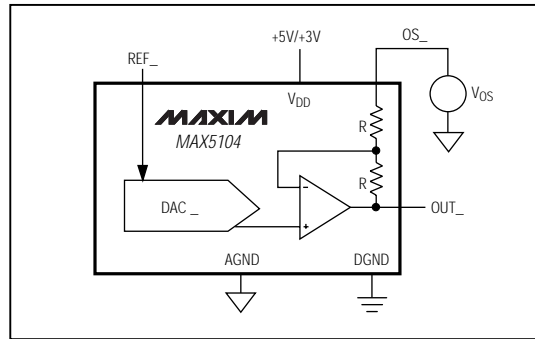

Figure 10. Setting  $OS_{-}$  for Output Offset

**Table 2. Unipolar Code Table (Gain = +2)**

DAC CONTENTS MSB	LSB	ANALOG OUTPUT
1111	1111 1111 (0)	$+V_{REF} \left( \frac{4095}{4096} \right) \cdot 2$
1000	0000 0001 (0)	$+V_{REF} \left( \frac{2049}{4096} \right) \cdot 2$
1000	0000 0000 (0)	$+V_{REF} \left( \frac{2048}{4096} \right) \cdot 2 = V_{REF}$
0111	1111 1111 (0)	$+V_{REF} \left( \frac{2047}{4096} \right) \cdot 2$
0000	0000 0001 (0)	$+V_{REF} \left( \frac{1}{4096} \right) \cdot 2$
0000	0000 0000 (0)	0V

Note: ( ) are for the sub-bit.

# Low-Power, Dual, Voltage-Output, 12-Bit DAC with Serial Interface

MAX5104

$$V_{OUT} = V_{REF} \left[ \left( \frac{2 \cdot NB}{4096} \right) - 1 \right]$$

where NB represents the numeric value of the DAC's binary input code. Table 3 shows digital codes and the corresponding output voltage for Figure 11's circuit.

### Using an AC Reference

In applications where the reference has an AC signal component, the MAX5104 has multiplying capabilities within the reference input voltage range specifications. Figure 12 shows a technique for applying a sinusoidal input to REF<sub>-</sub>, where the AC signal is offset before being applied to the reference input.

### Harmonic Distortion and Noise

The total harmonic distortion plus noise (THD+N) is typically less than -78dB at full scale with a 1Vp-p input swing at 5kHz.

### Digital Calibration and Threshold Selection

Figure 13 shows the MAX5104 in a digital calibration application. With a bright-light value applied to the photodiode (on), the DAC is digitally ramped until it trips the comparator. The microprocessor (μP) stores this "high" calibration value. Repeat the process with a dim light (off) to obtain the dark current calibration.

**Table 3. Bipolar Code Table**

DAC CONTENTS MSB	LSB	ANALOG OUTPUT
1111	1111 1 111 (0)	$+V_{REF} \left( \frac{2047}{2048} \right)$
1000	0000 0 001 (0)	$+V_{REF} \left( \frac{1}{2048} \right)$
1000	0000 0 000 (0)	0V
0111	1111 1 111 (0)	$-V_{REF} \left( \frac{1}{2048} \right)$
0000	0000 0 001 (0)	$+V_{REF} \left( \frac{2047}{4096} \right) \cdot 2$
0000	0000 0 000 (0)	$-V_{REF} \left( \frac{2048}{2048} \right) = -V_{REF}$

**Note:** ( ) are for the sub-bit.

Figure 12. AC Reference Input Circuit

Figure 11. Bipolar Output Circuit

Figure 13. Digital Calibration

## Low-Power, Dual, Voltage-Output, 12-Bit DAC with Serial Interface

Figure 14. Digital Control of Gain and Offset

The  $\mu P$  then programs the DAC to set an output voltage at the midpoint of the two calibrated values. Applications include tachometers, motion sensing, automatic readers, and liquid-clarity analysis.

### Digital Control of Gain and Offset

The two DACs can be used to control the offset and gain for curve-fitting nonlinear functions, such as transducer linearization or analog compression/expansion applications. The input signal is used as the reference for the gain-adjust DAC, whose output is summed with the output from the offset-adjust DAC. The relative weight of each DAC output is adjusted by R1, R2, R3, and R4 (Figure 14).

### Power-Supply Considerations

On power-up, the input and DAC registers clear (set to zero code). For rated performance, V<sub>REF\_</sub> should be at least 1.4V below V<sub>DD</sub>. Bypass the power supply with a 4.7 $\mu F$  capacitor in parallel with a 0.1 $\mu F$  capacitor to AGND. Minimize lead lengths to reduce lead inductance.

### Grounding and Layout Considerations

Digital and AC transient signals on AGND can create noise at the output. Connect AGND to the highest quality ground available. Use proper grounding techniques, such as a multilayer board with a low-inductance ground plane. Carefully lay out the traces between channels to reduce AC cross-coupling and crosstalk. Wire-wrapped boards and sockets are not recommended. If noise becomes an issue, shielding may be required.

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.
