Dual, 256-Tap, Volatile, Low-Voltage, Linear Taper Digital Potentiometer

MAX5392

General Description

The MAX5392 dual, 256-tap, volatile, low-voltage, linear taper digital potentiometer offers three end-to-end resistance values of 10k Ω , 50k Ω , and 100k Ω . Operating from a single +1.7V to +5.5V power supply, the device provides a low 35ppm/ $^{\circ}$ C end-to-end temperature coefficient. The device features an I²C interface.

The small package size, low supply operating voltage, low supply current, and automotive temperature range of the MAX5392 makes the device uniquely suited for the portable consumer market, battery-backup industrial applications, and the automotive market.

The MAX5392 is specified over the automotive -40 $^{\circ}$ C to +125 $^{\circ}$ C temperature range and is available in a 16-pin TSSOP package.

Applications

Low-Voltage Battery Applications
 Portable Electronics
 Mechanical Potentiometer Replacement
 Offset and Gain Control
 Adjustable Voltage References/Linear Regulators
 Automotive Electronics

Features

- ◆ Dual, 256-Tap Linear Taper Positions
- ◆ Single +1.7V to +5.5V Supply Operation
- ◆ Low 12 μ A Quiescent Supply Current
- ◆ 10k Ω , 50k Ω , 100k Ω End-to-End Resistance Values
- ◆ I²C-Compatible Interface
- ◆ Wiper Set to Midscale on Power-Up
- ◆ -40 $^{\circ}$ C to +125 $^{\circ}$ C Operating Temperature Range

Ordering Information

PART	PIN-PACKAGE	END-TO-END RESISTANCE (k Ω)
MAX5392LAUE+	16 TSSOP	10
MAX5392MAUE+	16 TSSOP	50
MAX5392NAUE+	16 TSSOP	100

Note: All devices are specified over the -40 $^{\circ}$ C to +125 $^{\circ}$ C operating temperature range.

+ Denotes a lead(Pb)-free/RoHS-compliant package.

ABSOLUTE MAXIMUM RATINGS

V _{DD} to GND	-0.3V to +6V	Continuous Power Dissipation (T _A = +70°C)
H ₋ , W ₋ , L ₋ to GND	-0.3V to the lower of (V _{DD} + 0.3V) and +6V	16-Pin TSSOP (derate 11.1mW/°C above +70°C) ...888.9mW
All Other Pins to GND	-0.3V to +6V	Operating Temperature Range
Continuous Current in to H ₋ , W ₋ , and L ₋		Junction Temperature
MAX5392L	±5mA	Storage Temperature Range.....
MAX5392M	±2mA	Lead Temperature (soldering, 10s)
MAX5392N.....	±1mA	Soldering Temperature (reflow)

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{DD} = +1.7V to +5.5V, V_{H-} = V_{DD}, V_{L-} = 0, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at V_{DD} = +1.8V, T_A = +25°C.) (Note 1)

ELECTRICAL CHARACTERISTICS (continued)

($V_{DD} = +1.7V$ to $+5.5V$, $V_{H_} = V_{DD}$, $V_{L_} = 0$, $T_A = T_{MIN}$ to T_{MAX} , unless otherwise noted. Typical values are at $V_{DD} = +1.8V$, $T_A = +25^\circ C$.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Data Setup Time	$t_{SU:DAT}$		100			ns
Data Hold Time	$t_{HD:DAT}$		0			μs
SDA, SCL Rise Time	t_R				0.3	μs
SDA, SCL Fall	t_F				0.3	μs
Setup Time for STOP Condition	$t_{SU:STO}$		0.6			μs
Bus Free Time Between STOP and START Condition	t_{BUF}	Minimum power-up rate = $0.2V/\mu s$	1.3			μs
Pulse Suppressed Spike Width	t_{SP}				50	ns
Capacitive Load for Each Bus	CB	(Note 9)			400	pF

Note 1: All devices are 100% production tested at $T_A = +25^\circ C$. Specifications over temperature limits are guaranteed by design and characterization.

Note 2: DNL and INL are measured with the potentiometer configured as a voltage-divider (Figure 1) with $H_ = V_{DD}$ and $L_ = GND$. The wiper terminal is unloaded and measured with a high-input-impedance voltmeter.

Note 3: R-DNL and R-INL are measured with the potentiometer configured as a variable resistor (Figure 1). DNL and INL are measured with the potentiometer configured as a variable resistor. $H_$ is unconnected and $L_ = GND$. For $V_{DD} = +5V$, the wiper terminal is driven with a source current of $400\mu A$ for the $10k\Omega$ configuration, $80\mu A$ for the $50k\Omega$ configuration, and $40\mu A$ for the $100k\Omega$ configuration. For $V_{DD} = +1.7V$, the wiper terminal is driven with a source current of $150\mu A$ for the $10k\Omega$ configuration, $30\mu A$ for the $50k\Omega$ configuration, and $15\mu A$ for the $100k\Omega$ configuration.

Note 4: The wiper resistance is the worst value measured by injecting the currents given in Note 3 to $W_$ with $L_ = GND$. $R_{W_} = (V_{W_} - V_{H_})/I_{W_}$.

Note 5: Drive HA with a 1kHz GND to V_{DD} amplitude tone. $LA = LB = GND$. No load. WB is at midscale with a $10pF$ load. Measure WB.

Note 6: The wiper-settling time is the worst-case 0 to 50% rise time, measured between tap 0 and tap 127. $H_ = V_{DD}$, $L_ = GND$, and the wiper terminal is loaded with $10pF$ capacitance to ground.

Note 7: Digital timing is guaranteed by design and characterization, not production tested.

Note 8: The SCL clock period includes rise and fall times ($t_R = t_F$). All digital input signals are specified with $t_R = t_F = 2ns$ and timed from a voltage level of $(V_{IL} + V_{IH})/2$.

Note 9: An appropriate bus pullup resistance must be selected depending on board capacitance. For I²C-bus specification information from NXP Semiconductor (formerly Philips Semiconductor), refer to the UM10204: I²C-Bus Specification and User Manual.

Pin Description

PIN	NAME	FUNCTION
1	HA	Resistor A High Terminal. The voltage at HA can be higher or lower than the voltage at LA. Current can flow into or out of HA.
2	WA	Resistor A Wiper Terminal
3	LA	Resistor A Low Terminal. The voltage at LA can be higher or lower than the voltage at HA. Current can flow into or out of LA.
4	HB	Resistor B High Terminal. The voltage at HB can be higher or lower than the voltage at LB. Current can flow into or out of HB.
5	WB	Resistor B Wiper Terminal
6	LB	Resistor B Low Terminal. The voltage at LB can be higher or lower than the voltage at HB. Current can flow into or out of LB.
7	BYP	Internal Power-Supply Bypass. For additional charge-pump filtering, bypass to GND with a capacitor close to the device.
8	I.C.	Internally Connected. Connect to GND.
9	GND	Ground
10	A2	Address Input 2. Connect to V _{DD} or GND.
11	A1	Address Input 1. Connect to V _{DD} or GND.
12	A0	Address Input 0. Connect to V _{DD} or GND.
13	SDA	I ² C-Compatible Serial-Data Input/Output. A pullup resistor is required.
14	SCL	I ² C-Compatible Serial-Clock Input. A pullup resistor is required.
15	N.C.	No Connection. Not internally connected.
16	V _{DD}	Power-Supply Input. Bypass V _{DD} to GND with a 0.1μF capacitor close to the device.

Dual, 256-Tap, Volatile, Low-Voltage, Linear Taper Digital Potentiometer

Detailed Description

The MAX5392 dual, 256-tap, volatile, low-voltage linear taper digital potentiometer offers three end-to-end resistance values of 10k Ω , 50k Ω , and 100k Ω . The potentiometer consists of 255 fixed resistors in series between terminals H₋ and L₋. The potentiometer wiper, W₋, is programmable to access any one of the 256 tap points on the resistor string.

The potentiometers are programmable independently of each other. The MAX5392 features an I²C interface.

Charge Pump

The MAX5392 contains an internal charge pump that guarantees the maximum wiper resistance, R_{WL}, to be less than 200 Ω for supply voltages down to 1.7V. Pins H₋, W₋, and L₋ are still required to be less than V_{DD} + 0.3V. A bypass input, BYP, is provided to allow additional filtering of the charge-pump output, further reducing clock feedthrough that can occur on H₋, W₋, or L₋. The nominal clock rate of the charge pump is 600kHz. BYP should remain resistively unloaded as any additional load would increase clock feedthrough. See the Charge-Pump Feedthrough at W₋ vs. CBYP graph in the *Typical Operating Characteristics* for CBYP sizing guidelines with respect to clock feedthrough to the wiper. The value of CBYP does affect the startup time of the charge

pump; however, CBYP does not impact the ability to communicate with the device, nor is there a minimum CBYP requirement. The maximum wiper impedance specification is not guaranteed until the charge pump is fully settled. See the BYP Ramp Time vs. CBYP graph in the *Typical Operating Characteristics* for CBYP impact on charge-pump settling time.

I²C Digital Interface

The I²C interface contains a shift register that decodes the command and address bytes, routing the data to the appropriate control registers. Data written to a control register immediately updates the wiper position. The wipers A and B power up in midposition, D[7:0] = 80h.

Serial Addressing

The MAX5392 operates as a slave device that receives data through an I²C/SMBus™-compatible 2-wire serial interface. The interface uses a serial-data access line (SDA) and a serial-clock line (SCL) to achieve bidirectional communication between master(s) and slave(s). A master, typically a microcontroller, initiates all data transfers to the port and generates the SCL clock that synchronizes the data transfer. See Figure 2. Connect a pullup resistor, typically 4.7k Ω , between each of the SDA and SCL lines to a voltage between V_{DD} and 5.5V.

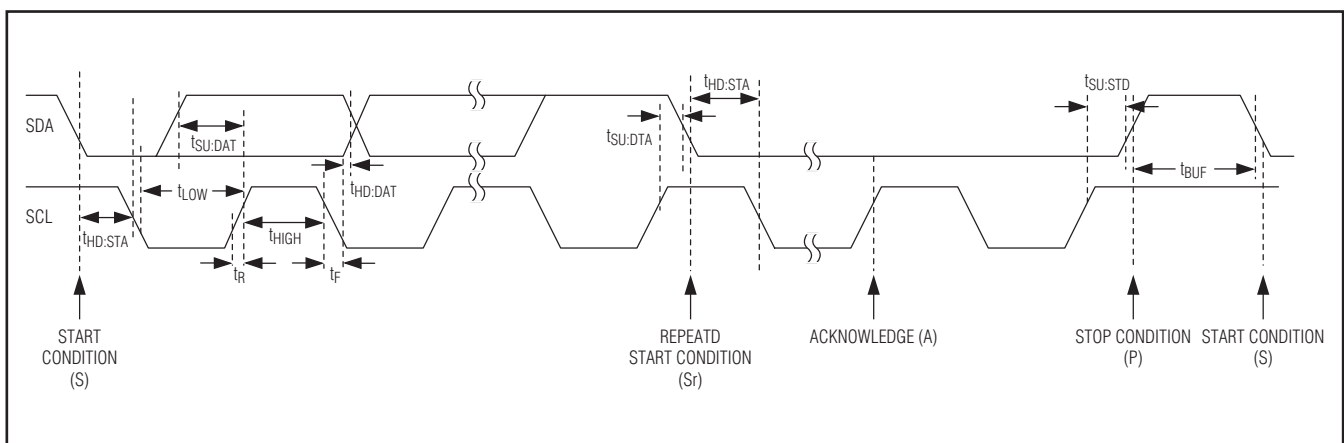

Figure 2. I²C Serial-Interface Timing Diagram

SMBus is a trademark of Intel Corp.

Dual, 256-Tap, Volatile, Low-Voltage, Linear Taper Digital Potentiometer

Each transmission consists of a START (S) condition sent by a master, followed by a 7-bit slave address plus a NOP/ \bar{W} bit. See Figures 3, 4, and 7.

START and STOP Conditions

SCL and SDA remain high when the interface is inactive. A master controller signals the beginning of a transmission with a START condition by transitioning SDA from high to low while SCL is high. The master controller issues a STOP condition by transitioning the SDA from low to high while SCL is high, after finishing communicating with the slave. The bus is then free for another transmission. See Figure 2.

Bit Transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable while SCL is high. See Figure 5.

Acknowledge

The acknowledge bit is a clocked 9th bit that the recipient uses to handshake receipt of each byte of data. See Figure 6. Each byte transferred requires a total of 9 bits. The master controller generates the 9th clock pulse, and the recipient pulls down SDA during the acknowledge clock pulse, so the SDA line remains stable low during the high period of the clock pulse.

Figure 3. START and STOP Conditions

Figure 4. Slave Address

Figure 5. Bit Transfer

Dual, 256-Tap, Volatile, Low-Voltage, Linear Taper Digital Potentiometer

Figure 6. Acknowledge

Figure 7. Command and Single Data Byte Received

Slave Address

The MAX5392 includes a 7-bit slave address (Figure 4). The 8th bit following the 7th bit of the slave address is the $\text{NOP}/\overline{\text{W}}$ bit. Set the $\text{NOP}/\overline{\text{W}}$ bit low for a write command and high for a no-operation command. The device does not support readback.

The device provides three address inputs (A0, A1, and A2), allowing up to eight devices to share a common bus (Table 1). The first 4 bits (MSBs) of the factory-set slave addresses are always 0101. A2, A1, and A0 set the next 3 bits of the slave address. Connect each address input to V_{DD} or GND. Each device must have a unique address to share a common bus.

Message Format for Writing

Write to the devices by transmitting the device's slave address with $\text{NOP}/\overline{\text{W}}$ (8th bit) set to zero, followed by at least 2 bytes of information. The first byte of informa-

tion is the command byte. The second byte is the data byte. The data byte goes into the internal register of the device as selected by the command byte (Figure 7 and Table 2).

Table 1. Slave Addresses

ADDRESS INPUTS			SLAVE ADDRESS
A2	A1	A0	
GND	GND	GND	0101000

Command Byte

Use the command byte to select the destination of the wiper data. See Table 2.

Command Descriptions

REG A: The data byte writes to register A and the wiper of potentiometer A moves to the appropriate position. D[7:0] indicates the position of the wiper. D[7:0] = 00h moves the wiper to the position closest to LA. D[7:0] = FFh moves the wiper closest to HA. D[7:0] is 80h following power-on.

REG B: The data byte writes to register B and the wiper of potentiometer B moves to the appropriate position. D[7:0] indicates the position of the wiper. D[7:0] = 00h moves the wiper to the position closest to LB. D[7:0] = FFh moves the wiper to the position closest to HB. D[7:0] is 80h following power-on.

REG A and B: The data byte writes to registers A and B and the wipers of potentiometers A and B move to the appropriate position. D[7:0] indicates the position of the wiper. D[7:0] = 00h moves the wipers to the position closest to L_. D[7:0] = FFh moves the wipers to the position closest to H_. D[7:0] is 80h following power-on.
