MAX6806/MAX6807/ MAX6808

Voltage Detectors

General Description

The MAX6806/MAX6807/MAX6808 precision voltage detectors are ideal for accurate monitoring of power supplies in digital systems. They provide circuit reliability and reduce total cost by eliminating external components and adjustments.

The MAX6806/MAX6807/MAX6808 assert a reset signal whenever the supply voltage (V_{CC}) falls below the factory-preset, ±2% accurate threshold. Internal hysteresis ensures stable switching. The MAX6806/MAX6807/MAX6808 are available in 4.6V and 2.6V thresholds (2.3V is also available for the MAX6806 only). The MAX6806 features an active-low, push-pull $\overline{RESET}$ output; the MAX6807 features an active-high, push-pull RESET output; and the MAX6808 features an active-low, open-drain $\overline{RESET}$ output. $\overline{RESET}$ is valid for V_{CC} down to 1V (MAX6806/MAX6808), and RESET (MAX6807) is guaranteed for V_{CC} down to 1.2V.

The MAX6806/MAX6807/MAX6808 are available in 3-pin SC70, 3-pin SOT23, 8-pin µMAX, 8-pin SO, and 4-pin SOT143 packages. The SOT143 package includes a manual-reset input.

Applications

- Computers
- Controllers
- Intelligent Instruments
- Critical µP and µC Power Monitoring
- Portable/Battery-Powered Equipment
- Bar-Code Scanners

Features

- Preset Reset Thresholds: 4.6V and 2.6V (2.3V also available for MAX6806 only)
- ±2% Accurate Reset Thresholds
- Reset Output Available in Active-Low (MAX6806), Active-High (MAX6807), and Open-Drain (MAX6808) Versions
- Immune to Power-Supply Transients
- $\overline{RESET}$ Valid to V_{CC} = 1.0V (MAX6806/MAX6808)
- 35µA Supply Current
- No External Components
- Manual Reset Available with 4-Pin SOT143 Package
- Miniature 3-Pin SC70, 3-Pin SOT23, and 4-Pin SOT143 Packages
- 8-Pin µMAX and 8-Pin SO Packages are Pin Compatible with the MC33064/MC33164/ MC34064/MC34164

Detailed Description

Reset Output

The MAX6806 voltage detector features an active-low, push-pull $\overline{\text{RESET}}$ output, while the MAX6807 features an active-high, push-pull RESET output. Unlike microprocessor (µP) supervisory circuits that offer a reset timeout period, the MAX6806 and MAX6807 $\overline{\text{RESET}}$ goes high and RESET goes low virtually immediately once V_{CC} exceeds the reset threshold. If a brownout occurs (V_{CC} falls below the reset threshold), $\overline{\text{RESET}}$ goes low and RESET goes high. $\overline{\text{RESET}}$ is guaranteed to be a logic low for V_{CC} ≥ 1V and RESET is guaranteed to be a logic high for V_{CC} ≥ 1.2V.

The MAX6808 features an active-low, open-drain $\overline{\text{RESET}}$ output. The output sinks current when V_{CC} falls below the reset threshold. Connect a pullup resistor from $\overline{\text{RESET}}$ to any supply voltage up to 6V (Figure 1). Select a resistor value large enough to provide a logic low and small enough to provide a logic high while supplying all input and leakage currents connected to the $\overline{\text{RESET}}$ line. A 100kΩ resistor is sufficient in applications driving high-impedance loads.

The manual reset input (MR, 4-pin SOT143 package) can also initiate a reset (see Manual Reset Input section).

Manual-Reset Input

Many applications require manual-reset capabilities, allowing an operator, a test technician, or external logic circuitry to initiate a reset. A logic high on MR asserts a reset and remains asserted while MR is high. This input has an 80kΩ pulldown resistor, so the input can be left unconnected if not used. Connect a normally open momentary switch from MR to V_{CC} to create a manual-reset function. If MR is driven from long cables or if the device is used in a noisy environment, connecting a 0.1µF capacitor from MR to ground provides noise immunity.

Hysteresis

The MAX6806/MAX6807/MAX6808 feature internal hysteresis that creates two trip points: one for the rising supply voltage and one for the falling supply voltage (Figure 2). The hysteresis prevents the output from oscillating (chattering) when V_{CC} is near the reset threshold.

Reset Threshold Accuracy

The MAX6806/MAX6807/MAX6808 are ideal for sys-tems using a 5V ±5%, 3V ±5%, or 2.5V ±5% power supply with ICs specified for 5V ±10%, 3V ±10%, or 2.5V ±10%, respectively. The reset is guaranteed to assert after the power supply falls out of regulation, but before power drops below the minimum specified oper-ating voltage range for the system ICs.

Applications Information

Negative-Going V_{CC} Transients

In addition to asserting a reset signal during power-up, power-down, and brown-out conditions, the MAX6806/MAX6807/MAX6808 are immune to short-duration, negative-going V_{CC} transients.

Figure 3 displays typical transient durations vs. reset-comparator overdrive for which the MAX6806/MAX6807/MAX6808 do **not** generate a reset pulse. The graph was generated using a negative-going pulse applied to V_{CC}, starting 0.5V above the actual reset threshold and ending below it by the magnitude indicated (reset-comparator overdrive). The graph indicates the maximum pulse width a negative-going V_{CC} transient can have without causing a reset pulse. As the magnitude of the transient increases (goes further below the reset threshold), the maximum allowable pulse width decreases. A 0.1µF capacitor mounted as close as possible to V_{CC} provides additional transient immunity.

Ensuring a Valid Reset Output Down to V_{CC} = Ground

When V_{CC} falls below 1V, the MAX6806/MAX6808 $\overline{RESET}$ output no longer sinks current—it becomes an open circuit. Therefore, high-impedance CMOS logic inputs connected to $\overline{RESET}$ can drift to undetermined voltages. This presents no problem in most applications, since most circuitry is inoperative when V_{CC} is below 1V. In applications where $\overline{RESET}$ must be valid down to ground, add a pulldown resistor to $\overline{RESET}$ so any stray leakage currents flow to ground, holding $\overline{RESET}$ low (Figure 4). Select R1 to be large enough not to load $\overline{RESET}$ and small enough to pull $\overline{RESET}$ to ground. For most applications, 100kΩ will not load $\overline{RESET}$ and will pull $\overline{RESET}$ to ground. Similarly, if RESET (MAX6807) must be valid below 1.2V, add a pullup resistor to RESET.

Interfacing to µPs with Bidirectional Reset Pins

µPs with bidirectional reset pins (such as the Motorola 68HC11 series) can contend with push-pull $\overline{\text{RESET}}$ outputs, resulting in indeterminate logic levels. Use the MAX6808 with the open-drain $\overline{\text{RESET}}$ when interfacing to this type of controller.
