

MAX77324 Evaluation Kit

Evaluates: MAX77324

General Description

The MAX77324 evaluation kit (EV kit) provides a proven design to evaluate a high-efficiency synchronous step-down DC-DC converter with integrated MOSFETs that operate over a 2.5V to 4.8V input voltage range, 0.6V to 2V output voltage range, and supports up to 1.5A of load current. The device automatically transitions between PWM and SKIP modes of operation when the load condition changes.

Benefits and Features

- Proven PCB Reference Design and Layout
- Fully Assembled and Tested
- Sense Points for High-Accuracy Measurements
- Test Point and Jumper for Enable

[Ordering Information](#) appears at end of data sheet.

Quick Start

Required Equipment

- MAX77324 EV kit
- Power supply with 6V and 1A capability
- Two digital voltmeter (DVM)
- Ammeter

Procedure

The EV kit is fully assembled and tested. Follow these steps to verify board operation:

- 1) Install J1 as recommended in [Table 1](#).
- 2) Connect a disabled 3.8V bench power supply through an ammeter to the V_{IN} and PGND inputs. Set the input current limit of the bench power supply to 100mA. Set the ammeter range to its 10mA setting. **Do not** enable the output of the bench supply until prompted.
- 3) Connect a voltmeter to the VINS and GNDS terminals to measure input voltage.
- 4) Connect a voltmeter to the VOOTS and GNDS terminals to measure output voltage.
- 5) Enable the output of the bench power supply.
- 6) At this point, your setup is complete and the device under test (DUT) is Enabled. Confirm that your input current ammeter has $\sim 45\mu A$.
- 7) If the input current in the above step is correct, increase the input current limit of the bench supply to 1A. Also, increase the input ammeter range to 3A.
- 8) Observe the output voltage on the voltmeter between VOOTS and GNDS. Confirm that the output voltage matches the expected output voltage (refer to the *Setting the Output Voltage* section of the data sheet).
 - At higher load/input currents, the input current ammeter must either be set to a higher range or bypassed, so as not to drop the input voltage (measured at VINS) below operating voltages.

Detailed Description

Enabling and Disabling the Regulator

Turn on the device by installing a jumper between positions 1-2 on J1. The jumper connects the EN pin to V_{IN} , enabling the regulator with soft-start. Remove jumper J1 to disable the regulator. EN has an internal pulldown resistor to ground.

Table 1. Default Shunt Positions and Jumper Descriptions

REFERENCE DESIGNATOR	DEFAULT POSITION	FUNCTION
J1	1-2	<p>1-2: Connects EN to V_{IN} to enable the regulator.</p> <p>Open: Disconnect EN from V_{IN} to disable the regulator. EN has an internal pulldown resistor to ground.</p>

Table 2. Setting the Output Voltage

V_{OUT} (V)	R_{TOP} (k Ω)	R_{BOT} (k Ω)	C_{TOP} (pF)
0.6	Short	Open	Open
0.85	12.4	30.1	220
0.9	15	30.1	220
0.95	17.8	30.1	220
1.0	20	30.1	220
1.1	24.8	30.1	220
1.2	30.1	30.1	220
1.35	37.4	30.1	220
1.5	45.3	30.1	220
1.8	60.4	30.1	220
2.0	69.8	30.1	220

Setting the Output Voltage

The device uses resistors to set the output voltage between 0.6V and 2V. Connect a resistor divider between V_{OUT} , FB, and AGND as shown in [Figure 2](#). Choose R_{BOT} (FB to AGND) to be less than or equal to 30.1k Ω . One percent accuracy resistors are highly recommended to keep the accuracy of V_{OUT} . Calculate the value of R_{TOP} (V_{OUT} to FB) for a desired output voltage with Equation 1.

Equation 1:

$$R_{TOP} = R_{BOT} \times \left[\frac{V_{OUT}}{V_{FB}} - 1 \right]$$

Where V_{FB} is 0.6V and V_{OUT} is the desired output voltage.

C_{TOP} is to maintain the stability of the device. Suggest C_{TOP} to be 220pF for the full operation range of the device.

Ordering Information

PART	TYPE
MAX77324EVKIT#	EV Kit

#Denotes RoHS compliant.

On the MAX77324 evaluation board, default V_{OUT} is set to 1.2V by choosing the value of both R_{BOT} and R_{TOP} to be equal (30.1k Ω).
