## Low-Jitter, 800Mbps, 10-Port LVDS Repeaters with 100 $\Omega$ Drive

#### Abstract

General Description The MAX9153/MAX9154 low-jitter, low-voltage differential signaling (LVDS) repeaters are ideal for applications that require high-speed data or clock distribution while minimizing power, space, and noise. The devices accept a single LVDS input (MAX9153) or single LVPECL input (MAX9154) and repeat the signal at 10 LVDS outputs. Each differential output drives $100 \Omega$, allowing point-topoint distribution of signals on transmission lines with $100 \Omega$ termination at the receiver input. Ultra-low 90psp-p (max) added deterministic jitter and $1 \mathrm{pS}_{\text {RMS }}$ (max) added random jitter ensure reliable communication in high-speed links that are highly sensitive to timing error, especially those incorporating clock-anddata recovery or serializers and deserializers. The highspeed switching performance guarantees 800Mbps data rate and less than 60ps (max) skew between channels while operating from a single +3.3 V supply. Supply current at 800 Mbps is 118 mA and reduces to $2 \mu \mathrm{~A}$ in power-down mode. LVDS inputs and outputs conform to the ANSI/EIA/TIA -644 standard. A fail-safe feature on the MAX9153 sets the output high when the input is undriven and open, terminated, or shorted. The MAX9153/MAX9154 are available in a 28 -pin TSSOP package and are specified for the $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ extended temperature range. Refer to the MAX9150 data sheet for a pin-compatible 10-port LVDS repeater capable of driving a double-terminated (50 ) LVDS link. Refer to the MAX9110/MAX9112 and MAX9111/MAX9113 data sheets for LVDS line drivers and receivers.

## Applications

Cellular Phone Base-Stations
Add/Drop Muxes
Digital Cross-Connects
Network Switches/Routers
Backplane Interconnect
Clock Distribution

Pin Configuration appears at end of data sheet.

- Ultra-Low 90psp-p (max) Added Deterministic Jitter at 800Mbps ( $2^{23}-1$ ) PRBS Pattern
- 1psRms (max) Added Random Jitter
- 60ps (max) Skew Between Channels
- Guaranteed 800Mbps Data Rate
- LVDS (MAX9153) or LVPECL (MAX9154) Input Versions
- Fail-Safe Circuit Sets Output High for Undriven Inputs (MAX9153)
- High-Impedance Differential Input when VCC $=0$
- $2 \mu \mathrm{~A}$ Power-Down Supply Current
- Conforms to ANSI/EIA/TIA-644 LVDS Standard
- Pin-Compatible Upgrade to DS90LV110

Ordering Information

| PART | TEMP. <br> RANGE | PIN- <br> PACKAGE | INPUT |
| :---: | :---: | :--- | :---: |
| MAX9153EUI | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 28 TSSOP | LVDS |
| MAX9154EUI | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 28 TSSOP | LVPECL |

Typical Application Circuit

## Low-Jitter, 800Mbps, 10-Port LVDS Repeaters with 100 $\Omega$ Drive

## ABSOLUTE MAXIMUM RATINGS

| $V_{C C}$ to G | V to +4.0 V |
| :---: | :---: |
| RIN+, RIN- to GND. | -0.3V to +4.0V |
| PWRDN to GND. | .-0.3V to (VCC + 0.3V) |
| DO_+, DO_- to GND | .......-0.3V to +4.0V |
| Short-Circuit Duratio | Continuous |
| Continuous Power Dis |  |
| 28-Pin TSSOP (de | $\left.+70^{\circ} \mathrm{C}\right) \ldots . .1026 \mathrm{mw}$ |

Storage Temperature......................................... $65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Maximum Junction Temperature ..................................... $+150^{\circ} \mathrm{C}$
Operating Temperature Range ........................... $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
ESD Protection
Human Body Model (RIN+, RIN-, DO_+, DO_-) .............. $\pm 8 \mathrm{kV}$
Lead Temperature (soldering, 10s) ................................. $300^{\circ} \mathrm{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Detailed Description

LVDS is a signaling method for point-to-point data communication over a controlled-impedance medium as defined by the ANSI/TIA/EIA-644 and IEEE 1596.3 standards. LVDS uses a lower voltage swing than other common communication standards, achieving higher data rates with reduced power consumption, while reducing EMI emissions and system susceptibility to noise.
The MAX9153/MAX9154 are 800Mbps, 10-port repeaters for high-speed, point-to-point, low-power
applications. The MAX9153 accepts an LVDS input and has a fail-safe input circuit. The MAX9154 accepts an LVPECL input. Both devices repeat the input at 10 LVDS outputs. The devices detect differential signals as low as 50 mV and as high as 1.2 V within the 0 to 2.4 V input voltage range as specified in the LVDS standards.
The MAX9153/MAX9154 outputs use a current-steering configuration to generate a 2.5 mA to 4.5 mA output current. This current-steering approach induces less ground bounce and no shoot-through current, enhancing noise margin and system speed performance. The outputs are short-circuit current limited and are high

## Low-Jitter, 800Mbps, 10-Port LVDS Repeaters with $100 \Omega$ Drive

impedance (to ground) when $\overline{\text { PWRDN }}=$ low or the device is not powered. The outputs have a typical differential resistance of $238 \Omega$. The internal differential output resistance terminates induced noise and reflections from the primary termination located at the LVDS receiver.

The MAX9153/MAX9154 current-steering output requires a resistive load to terminate the signal and complete the transmission loop. Because the devices switch the direction of current flow and not voltage levels, the output voltage swing is determined by the value of the termination resistor multiplied by the output current. With a typical 3.8 mA output current, the MAX9153/MAX9154 produce a 380mV output voltage when driving a transmission line terminated with a $100 \Omega$ resistor $(3.8 \mathrm{~mA} \times 100 \Omega=380 \mathrm{mV}$ ). Logic states are determined by the direction of current flow through the termination resistor.

Table 1. Input/Output Function Table

| INPUT, VID |  | OUTPUTS, VOD |
| :---: | :---: | :---: |
| +50 mV | MAX9153 | High |
|  |  | Low |
| -50mV | High |  |
| Open |  | High |
| Undriven short | MAX9153 | High |
| Undriven terminated | MAX9153 |  |

Note: $V_{I D}=R I N+-R I N-, V_{O D}=D O_{-}+-D O_{-}$
High $=450 \mathrm{mV}>V_{O D}>250 \mathrm{mV}$
Low $=-250 \mathrm{mV}>V_{O D}>-450 \mathrm{mV}$

Fail-Safe
The fail-safe feature of the MAX9153 sets the outputs high when the differential input is:

- Open
- Undriven and shorted
- Undriven and terminated

Without a fail-safe circuit, when the input is undriven, noise at the input may switch the outputs and it may appear to the system that data is being sent. Open or undriven terminated input conditions can occur when a cable is disconnected or cut, or when an LVDS driver output is in high impedance. A shorted input can occur because of a cable failure.
When the input is driven with signals meeting the LVDS standard, the input common-mode voltage is less than VCC -0.3 V and the fail-safe circuit is not activated. If

Figure 1. MAX9153 Input Fail-Safe Circuit

Figure 2. MAX9154 Input Bias Resistors
the input is open, undriven and shorted, or undriven and parallel terminated, an internal resistor in the failand parallel terminated, an internal resistor in the fail-
safe circuit pulls both inputs above VCC -0.3 V , activating the fail-safe circuit and forcing the outputs high (Figure 1).
The MAX9154 is essentially the MAX9153 without the fail-safe circuit. The MAX9154 accepts input voltages from 0 to VCC (vs. 0 to 2.4 V for the MAX9153), which allows interfacing to LVPECL input signals while retaining a good common-mode tolerance.
ing a good common-mode tolerance.

# Low-Jitter, 800Mbps, 10-Port LVDS Repeaters with 100 10 Drive 

## Applications Information

## Supply Bypassing

Bypass each VCC with high-frequency surface-mount ceramic $0.1 \mu \mathrm{~F}$ and 1 nF capacitors in parallel as close to the device as possible, with the smaller value capacitor closest to the VCC pin.

Traces, Cables, and Connectors
The characteristics of input and output connections affect the performance of the MAX9153/MAX9154. Use controlled-impedance traces, cables, and connectors with matched characteristic impedance.
Ensure that noise couples as common mode by running the traces of a differential pair close together. Reduce within-pair skew by matching the electrical length of the traces of a differential pair. Excessive skew can result in a degradation of magnetic field cancellation. Maintain the distance between traces of a differential pair to avoid discontinuities in differential impedance. Minimize the number of vias to further prevent impedance discontinuities.
Avoid the use of unbalanced cables, such as ribbon cable. Balanced cables, such as twisted pair, offer superior signal quality and tend to generate less EMI due to canceling effects. Balanced cables tend to pick up noise as common mode, which is rejected by the LVDS receiver.

## Termination

The MAX9153/MAX9154 are specified for $100 \Omega$ differential characteristic impedance but can operate with $90 \Omega$ to $132 \Omega$ to accommodate various types of interconnect. The termination resistor should match the differential characteristic impedance of the interconnect and be located close to the LVDS receiver input. Use a $\pm 1 \%$ surface-mount termination resistor.
The output voltage swing is determined by the value of the termination resistor multiplied by the output current. With a typical 3.8 mA output current, the MAX9153/MAX9154 produce a 380 mV output voltage when driving a transmission line terminated with a $100 \Omega$ resistor $(3.8 \mathrm{~mA} \times 100 \Omega=$ 380 mV ).
