## nanoPower Comparators with Precision Reference in 4-Bump UCSP

### General Description

The MAX9644/MAX9645/MAX9646 are small, single comparators, ideal for a wide variety of portable electronics applications such as cell phones, media players, and notebooks that have extremely tight board space and power constraints. These comparators are offered in both a miniature 4-bump UCSP™ package with a 1mm x 1mm footprint (as small as two 0402 resistors) and a 5-pin SOT23 package.

The ICs feature an input voltage range of -0.3V to +5.5V, independent of supply voltage. These devices maintain high impedance at the inputs even when powered down ( $V_{CC}$  or  $V_{REF} = 0V$ ). They also feature internal filtering to provide high RF immunity.

The ICs have an internal 0.2V reference. These devices feature either a push-pull or an open-drain output. They consume only 700nA (max) supply current and operate down to  $V_{CC} = 1V$  over the extended -40°C to +85°C temperature range.

### Applications

- Cell Phones
- Portable Media Players
- Electronic Toys
- Notebook Computers
- Portable Medical Devices

### Benefits and Features

- Tiny, 1mm x 1mm x 0.6mm 4-Bump UCSP
  - Footprint = Two 0402 Resistors
  - Also Available in a 5-Pin SOT23 Package
- Ultra-Low Operating Current (700nA max)
- -0.3V to +5.5V Input Voltage Range
- Internal 0.2V Reference Trimmed to 1% Accuracy
- 15µs Propagation Delay
- -40°C to +85°C Extended Temperature Range

## Detailed Description

The MAX9644/MAX9645/MAX9646 are extremely small comparators ideal for compact, low-current, and low-voltage applications.

The ICs consume only 400nA (typ). The low-voltage operating capability of the operating current makes these devices extremely attractive to long-life battery-operated devices—these applications can now use a single digital power-supply rail to power the new generation of microcontrollers (which can be down to 0.9V). All parts are available in a tiny 4-bump UCSP, which is only 0.6mm tall and occupies a 1mm x 1mm footprint and a 5-pin SOT23.

### Input Stage Circuitry

Noninverting inputs are available on the MAX9644/MAX9646 and inverting inputs are available on the MAX9645.

The MAX9644/MAX9645/MAX9646 incorporate an innovative input stage architecture that allows their input voltage to exceed  $V_{CC}$  by several volts (limited only by the *Absolute Maximum Ratings*). This is unlike traditional comparators that have an input ESD diode clamp between the input and  $V_{CC}$ , limiting this maximum overvoltage to about 0.3V. The ICs architecture maintains a high input impedance to input signals even when the device power-supply voltage is completely turned off ( $V_{CC}$  or REF taken to 0V). This greatly benefits flexible power-saving schemes to be easily implemented in advanced battery-operated devices. On-chip filtering provides immunity from any RF noise being picked up by input traces. These devices feature an internal temperature-compensated, low-power 0.2V reference voltage

### Output Stage Structure

The MAX9644/MAX9645 have open-drain outputs that allow them to interface to logic circuitry running from supply voltages other than the one supplied to the part. These devices require an external pullup resistor or current source for proper operation. Many microcontroller digital inputs ports can be readily programmed to include these.

The MAX9646 has a push-pull output stage that can both sink and source current, eliminating the need for an external pullup resistor. In this case, the MAX9646 uses the microcontroller's power supply as  $V_{CC}$

## Applications Information

### Bypassing REF/ $V_{CC}$

Place a 0.1 $\mu$ F capacitor between REF or  $V_{CC}$  and GND as close as possible to the device. During a switching event, all comparators draw a current spike from their power-supply rails. This current spike is minimized by the use of an internal break-before-make design.

### Hysteresis Operation

The ICs feature internal hysteresis for noise immunity and glitch-free operation. If additional hysteresis is needed, an external positive feedback network can be easily implemented on the MAX9644 and MAX9646 noninverting input devices. Additional external hysteresis is not possible on the MAX9645 because the noninverting input of the comparator is not externally accessible.

Table 1. How Devices Behave Under Various Input Voltage Conditions

PART	INPUT VOLTAGE CONDITIONS	ACTION AT OUTPUT
MAX9644	$V_{IN} > 0.2V$	External pullup resistor pulls output high.
	$V_{IN} < 0.2V$	Output asserts low.
MAX9645	$V_{IN} > 0.2V$	Output asserts low.
	$V_{IN} < 0.2V$	External pullup resistor pulls output high.
MAX9646	$V_{IN} > 0.2V$	Output asserts high.
	$V_{IN} < 0.2V$	Output asserts low.
